Seattle City Light has been engaging in dialogue with peers of trade associations such as Large Public Power Corporation to address the CIP-013 standard development activities. We continue to be a strong supporter of efforts that ensure the security of the bulk electric system. We appreciate the great strides that the SDT has made in the development of this standard to address the elements of the FERC Order while balancing reasonable responsibilities as required by the electric industry in support of the security objectives.

Seattle City Light does not agree with including all BES Cyber Systems in Requirement R1. Using a risk-based approach, Seattle City Light requests limiting this requirement to high and medium only. As the current low impact requirements do not require entities to conduct an inventory of equipment and software or identify systems, Seattle City Light believes this requirement will place substantial additional administrative burden on entities with low impact assets. If a risk management plan is to be required low, with a reduced set of

requirements to address their lower risk, Seattle City Light requests that those requirements be included as an element of R5 so all the low impact requirements are together or, ideally, included in CIP-003 along with the content of R5.

Seattle City Light requests that the SDT add the following language from the rationale to the language of the standard: "Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts."

Seattle City Light is concerned about compliance obligations for procurement activities associated with multi-party wide-area contracts such as national, regional, state & city negotiated contracts. Examples include contracts from the National Association of State Procurement Officials (NASPO) Cooperative and the Western States Contracting Alliance. In some cases use of these contracts in procurement is mandated by other laws or regulations. An exception, comparable to a CIP Exceptional Circumstance, should be included in the standard for these kinds of procurement activities because they provide important negotiating strength, flexibility, and effectiveness in contracting (see Seattle City Light's response to Question #9 for additional information on exceptions).

Seattle City Light notes that the Rationale for R1 includes a definition of the term "vendors". This definition is also included in the Technical Guidance and Examples document. This term should be officially added to the NERC Glossary of Terms and capitalized when used.

For R1.1.2 Seattle City Light requests changing the word *evaluate* to *determine.*

For R1.2.1 Seattle City Light requests that the words Security Event and the definition from the Technical Guidance and Examples document be placed in the NERC Glossary of Terms and capitalized when used.

For R1.2.1 Seattle City Light requests that the SDT provide clarification on the language in the guidance document related to 1.2.1. The document references the "process for notification" which is very different than the "request vendor cooperation" language. The requirement as written would require that a process be defined and implemented. Seattle City Light requests additional language in the requirement that addresses "entities are not required to validate a vendor is adhering to its processes and a failure of a vendor to follow a defined process is not a violation of this Requirement."

In Measure M1, Seattle City Light requests that the language be changed to be consistent with the Requirement. Specifically, change "Evidence shall include (i) one or more documented supply chain cyber security risk management plan(s) that address controls for MITIGATING cyber security risks as specified in the Requirement…" to "Evidence shall include (i) one or more documented supply chain cyber security risk management plan(s) that address controls for ADDRESSING cyber security risks as specified in the Requirement…"

(BOLD emphasis added). The construction "address risk" conforms with the text of the Requirement and acknowledges that risk might be avoided or transferred, for example, as alternatives to being mitigated. **Seattle City Light requests that the title of the standard be changed to "Vendor Risk Management" to clarify that the scope of the required activities relate to the relationships among a utility and its vendors. In common usage, the term "supply chain risk management" encompasses a much broader scope of concerns, including quality control and verification of third-party suppliers as well as addressing sole-source and international dependencies. Although the FERC Order and SDT white paper cite concerns about both vendor risk and supply chain risk, the requirements actually proposed in CIP-013 address vendor risk. A change of title is a simple means to clarify what is intended in R1.1, in particular, and helps identify auditable actions throughout R1.**

It is unclear how the risk and requirements in R5 for Low Impact BES Cyber Systems are differentiated from the other requirements and how the requirements will be measured considering a list of Low Impact systems are not required. There seems to be some reduncancy between R1 and R5 for Low Impact. Suggest removing Low Impact requirements from CIP-013 and incorporating into CIP-003 for consitency.

Ambiguity in R1

FERC Order No. 829 asks for a plan to be developed and implemented by the entity that **includes** security controls for supply chain management for industrial control system hardware, software, and services associated with bulk electric system operations. It recognizes the diversity of BES Cyber System environments, technologies and risks among entities. FERC states that the "Reliability Standard may allow a responsible entity to meet the security objectives discussed below by having a plan to apply different controls based on the criticality of different assets."

We find that the use of word "address" in R1 is creating ambiguity.

We suggest that requirement should be clear in stating that entities are to identify supply chain cyber security risks, evaluate controls and select controls, and implement controls based on their acceptable risk levels for future procurement contracts.

In doing so, entities should consider, at minimum, the controls that are itemized in the FERC Order and evaluate whether implementation of those controls are appropriate based on risk.

The four objectives that R1 should address are not clear

FERC Order states the "following four specific security objectives in the context of addressing supply chain management risks: (1) software integrity and authenticity; (2) vendor remote access; (3) information system planning; and (4) vendor risk management and procurement controls. Responsible entities should be required to achieve these four objectives but have the flexibility as to how to reach the objective (i.e., the Reliability Standard should set goals (the "what"), while allowing flexibility in how a responsible entity subject to the Reliability Standard achieves that goal (the "how"))."

The required plan is not tied to the objectives stated in the FERC Order.

1. For Information System Planning, FERC Order appears to ask that the responsible entity must include security considerations as part of its information system planning and system development lifecycle. The information system planning and development lifecycle should be periodically reviewed and approved by CIP Senior Manager.

We believe that R1.1 is intended to address the Information System Planning objective in the FERC Order. Consideration of security risks in Information System Planning is the objective of the overall plan.

R1.1 causes ambiguity. It is not clear how controls can be used to identify and assess risk. Controls are used to mitigate risk. Evaluation of controls is performed prior to their selection depending on the acceptable level of risk and cost associated with the controls. The verbiage of Part 1.1.2 requires controls for the evaluation of methods to address risks. It does not require risks to actually be determined.

2. R1.2 lists a number of controls (some specifically stated in the FERC Order) and does not identify which objective these controls are to address.

a. For Software Integrity and Authenticity objective, FERC Order appears to ask that at minimum, entities should consider implementing the following controls to mitigate risk by:

1. Verifying the identity of the software publisher for all software and patches that are intended for use on BES Cyber Systems; and

2. Verifying the integrity of the software and patches before they are installed in the BES Cyber System environment. (R1.2.5)

The Standard appears to address this objective in Requirement 3. There is overlap/redundancy between R1.2.5 and Requirement 3.

b. For Vendor Remote Access to BES Cyber Systems, FERC Order appears to ask that at minimum, entities should consider implementing controls to mitigate risk by Logging and controlling all third-party (i.e., vendor) initiated remote access sessions including user-initiated and machine-to-machine vendor remote access. (R1.2.6)

The Standard appears to address this objective in Requirement 4. There is overlap/ redundancy between R1.2.6 and Requirement 4.

c. For Vendor Risk Management and Procurement Controls, FERC Order appears to ask that at minimum, entities' controls should consider implementing controls to mitigate by means of:

1. Vendor security event notification processes; (R1.2.1)

2. Vendor personnel termination notification for employees with access to remote and onsite systems; (R1.2.2)

3. Product/services vulnerability disclosures, such as accounts that are able to bypass authentication or the presence of hardcoded passwords; (R1.2.3)

4. Coordinated incident response activities; and (R1.2.4)

5. Other related aspects of procurement. (R1.2.7)

Related to R1.2.1, It is not clear what constitutes a "vendor security event". Every vendor may have a different consideration for what constitutes a "security event". It could include an instance of employee fraud, workplace assault, or even the announcement of a patch release.

Related to R1.2.4, Cyber Security Incident is a NERC defined term. Is a cyber security incident a Cyber Security Incident? If not, what is the distinction? If it is, the term will need to be capitalized. Also the term "vendor related cyber security incident" is not clear. Is it a Cyber Security Incident that could happen during procurement and deployment stage?

We also find R1.2.7 is unnecessary and creates ambiguity.

Applicability

FERC Order suggests that entities can perform their own assessment of risks and determine applicability of controls based on that.

It is not clear how the described controls are applicable to BES Cyber Systems based on their risk level in the context of CIP Standards (Low, Medium, and High).

The Standard extends applicability to the EACMS, PACS, and PCAs associated to BES Cyber Systems. We argue that PACS, EACMS and PCAs, although are important for Physical and Electronic Security, are not necessarily "industrial control system hardware, software, and computing and networking services associated with bulk electric system operations" as stated in the FERC Order.

This standard should not be applied to systems or assets not needed for BES operations.

Sacramento Municipal Utility District (SMUD) has been engaging in dialogue with peers of trade associations such as Large Public Power Council to address the CIP-013 standard development activities. We continue to be a strong supporter of efforts that ensure the security of the bulk electric system. We appreciate the great strides that the SDT has made in the development of this standard to address the elements of the FERC Order while balancing reasonable responsibilities as required by the electric industry in support of the security objectives. SMUD does not agree with including all BES Cyber Systems in Requirement R1. SMUD supports a risk-based approach, while limiting this requirement to high and medium only. As the current low impact requirements do not require entities to conduct an inventory of	

equipment and software or identify systems, SMUD believes this requirement will place substantial additional administrative burden on entities with low impact assets. If a risk management plan is to be required low, with a reduced set of requirements to address their lower risk, SMUD requests that those requirements be included as an element of R5 so all the low impact requirements are together or, ideally, included in CIP-003 along with the content of R5.

SMUD requests that the SDT add the following language from the rationale to the language of the standard: "Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts."

SMUD is concerned about compliance obligations for procurement activities associated with multi-party wide-area contracts such as state & city negotiated contracts. An exception, comparable to a CIP Exceptional Circumstance, should be included in the standard for these kinds of procurement activities (see SMUD's response to Question #9 for additional information on exceptions).

SMUD notes that the Rationale for R1 includes a definition of the term "vendors". This definition is also included in the Technical Guidance and Examples document. This term should be officially added to the NERC Glossary of Terms and capitalized when used.

For R1.1.2 SMUD requests changing the word *evaluate* to *determine.*

For R1.2.1 SMUD requests that the words Security Event and the definition from the Technical Guidance and Examples document be placed in the NERC Glossary of Terms and capitalized when used.

For R1.2.1 SMUD requests that the SDT provide clarification on the language in the guidance document related to 1.2.1. The document references the "process for notification" which is very different than the "request vendor cooperation" language. The requirement as written would require that a process be defined and implemented. SMUD requests additional language in the requirement that addresses "entities are not required to validate a vendor is adhering to its processes and a failure of a vendor to follow a defined process is not a violation of this Requirement."

2. The SDT developed CIP-013-1 Requirement R2 to address the Order No. 829 directive for entities to periodically reassess selected controls and keep plans up to date with emerging cyber security supply chain risk management concerns and vulnerabilities (P 46). Do you agree with the proposed requirement? If you do not agree, or if you agree but have comments or suggestions for the proposed requirement provide your recommendation and explanation.

Requirement Placement (CIP-013 versus CIP-003)

R1 (and R2) includes low, medium, and high BES Cyber Systems; however, the current CIP Standards put the low impact BES Cyber Systems (LIBCS) requirements in CIP-003. EEI recommends that the SDT consider whether to move the LIBCS requirements from CIP-013 into CIP-003. Moving the LIBCS to CIP-003 may make it easier for Responsible Entities with only LIBCS to implement the requirements.

However, Responsible Entities with high, medium, and low impact BES Cyber Systems (HIBCS, MIBCS, and LIBCS) may be concerned that moving the supply chain LIBCS requirements to CIP-003 may make it difficult for them to take a holistic approach to the CIP-013 requirements. For example, some entities may want to focus on their BES Cyber System vendors and apply a single vendor-based approach for HIBCS, MIBCS, and LIBCS. Also, CIP-013 is focused on the risk that vendors and suppliers may introduce into BES Cyber Systems, whereas the other CIP Standards are focused on more general cybersecurity risks that can be addressed by Responsible Entity operational controls, which are within the control of the Responsible Entity. Third-party risk is harder for Responsible Entities to control and the methods of control are more likely contractual than operational. For example, a Responsible Entity cannot control a vendor's manufacturing process, but can ask questions during procurement as to how security risk is managed by the vendor to help evaluate the level of risk the vendor may pose to the Responsible Entity. As a result, there may be value in keeping these requirements out of the other CIP Standards, which focus on operational controls for cybersecurity risk.

Applicable Systems

Requirement R1 applies to LIBCS as well as HIBCS and MIBCS and their associated EACMS, PACS, and PCAs. We do not believe that EACMS, PACS, and PCAs should be included under the scope of Requirement R1. The diversity and sheer number of these systems make it difficult to

document how Responsible Entities will address procurement for all of these systems in their risk management plans. Auditing these plans will also be difficult.

Some products and services may pose greater risk than others depending on many factors including risk introduced by the vendor, risk introduced by the vendor's product/service, or how the Responsible Entity deploys the vendor product or service. As a result, the requirement's objective should be to get Responsible Entities to evaluate vendor cybersecurity practices during procurement and develop methods to mitigate potential risks, whether that is choosing another vendor, implementing an operational control, or accepting the risk. CIP-013 cannot address all risk introduced by vendors and their products and services. Vendors have a responsibility to reduce risk in their manufacturing processes and Responsible Entities have a responsibility to reduce risk in their operations. The existing CIP standards already address Responsible Entity operational risk.

We are also concerned that by specifying the applicable systems in Requirement R1 that the requirement may be interpreted that every device in a system must be addressed by these plans. We recommend that the SDT consider either narrowing the scope of the requirement language or making it more flexible to allow Responsible Entities to define which systems need to be addressed by the plans based on the risk. For example, using "industrial control systems associated with BES Cyber Systems" may narrow the scope to more critical systems; however, industrial control systems would need to be defined by the SDT as interpretations may vary.

Security Objective

The security objective of Requirement R1 is unclear. Although it focuses on the Commission objectives 3 and 4, it would be helpful to make it clear in the requirement language so that Responsible Entities understand the purpose of the requirement.

Objective 3 is focused on making sure that Responsible Entities do not unintentionally plan to procure or fail to anticipate security issues during procurement or technology/vendor transitions. Objective 4 is focused on ensuring security concepts are addressed in future contracts. Both of these objectives are focused on evaluation of the risk that the vendor or vendor product/service may introduce to the BCS by the Responsible Entity during planning for and actual procurement of new systems. The controls that are required under Requirement R1 are also not operational controls, but process controls to assess and evaluate the risk.

Risk Acceptance

We understand that Order No. 706 ordered the ERO to remove acceptance of risk language from the CIP Reliability Standards. In this case, it was tied to a concern over uncontrolled compliance exceptions to addressing potential vulnerabilities and the Commission preferred the use

of technical feasibility, which led to technical feasibility exceptions. (See Order No. 706, P 150-151) We are not recommending the use of "acceptance of risk" in CIP-013, but we want to make it clear that risk acceptance may be a good option in dealing with procurement controls (CIP-013, Requirement R1), which are different than the operational controls covered by the other CIP Standards.

The security objective for Requirement 1 is focused on Responsible Entity awareness of risk that may be introduced by the vendor or vendor product/service. The Responsible Entity's ability to control this risk is limited. For example, the Responsible Entity may only have a few vendors to choose from for a particular procurement and the vendors may not have a well-defined process for vendor security event notification. The Responsible Entity can ask them to define a process and can even put language into a contract to require such a contract, but the vendors can say no. The Responsible Entity is left with the choice of either not procuring this device or system or accepting the risk. Documenting a compliance exception for every term the vendor does not agree to does not seem reasonable in light of the scope of Requirement R1 – the sheer numbers of systems covered (HIBCS, MIBCS, and LIBCS) and diversity of vendors for each of these systems and system components. Responsible Entities also cannot make the vendor develop or follow this process even if the vendor agrees to, which is also a consideration for the SDT – if the vendor does not comply with their contract terms is the Responsible Entity subject to a violation and penalty?

We recommend that the SDT consider, set, and articulate compliance expectations with Requirements R1 and R2 and recognize the difference between these procurement controls and the operational controls found in the rest of the CIP Standards.

Measure M1

We are concerned with the M1 language use of "written agreements" as a measure of plan implementation, even though it is introduced with "could include, but is not limited to." Requirement R1 does not (and should not) require Responsible Entities to use contract terms to meet the security objective. However, contract terms may be one method of "how" to meet the security objective ("what"), but not all entities will choose this "how". We are concerned that the inclusion of "written agreements" in the measure text suggests that this is a key piece of evidence for compliance with R1. Also, the use of "correspondence" in M1 could include "written agreements" if an entity chooses to use them for R1. We recommend removing "written agreements in electronic or hard copy format" from M1.

We recommend the following language for consideration by the SDT:

R1. Each Responsible Entity shall implement one or more documented supply chain risk management plan(s) to minimize the cyber security risks from vendors and vendor products and services to BES Cyber Systems during planning and procurement of industrial control systems. The plan(s) should address one or more methods to:

1.1. Raise awareness of risk the vendor and vendor product or service may introduce, including awareness of vendor process(es) to:

1.1.1. Notify the Responsible Entity of vendor security events;

1.1.2. Notify the Responsible Entity of when vendor employee remote or onsite access should no longer be granted;

1.1.3. Disclose known vulnerabilities to the Responsible Entity;

1.1.4. Coordinate the response to vendor-related cyber security incidents with the Responsible Entity;

1.1.5. Verify the software integrity and authenticity of vendor software and patches; and

1.1.6. Control remote access, including vendor-initiated interactive remote access and system-to-system remote access to the Responsible Entity

1.2. Assess risk(s) introduced by the vendor and vendor product or service identified by Part 1.1; and

1.3. Evaluate method(s) to address risk(s) identified by Part 1.2.

SDG&E agrees with EEI comments and proposed language. Particularly R1 should only focus on supply chain risk management during the procurement phase rather than controls during operations. Operational controls on BES systems should be covered in other CIP standards. Furthermore, if controls are to be required on a vendor's manufacturing process, in addition to those identified during RFP negotiations, these controls should be consistent and verifiable by an industry standard (similar to ISO(?) 9001 certification).

The IRC and SWG thanks the Drafting Team for their work and support the concepts in the security program enhancements addressing supply chain risks.

The Rationale for R1 states, “Implementation of elements contained in the entity’s plan related to Party 1.2 is accomplished through the entities procurement and negotiation process.” The SDT need to define the process for determining the minimum level deemed to be sufficient. Additionally, the SDT needs to identify the course of action an entity must take and document where a vendor is unwilling or unable to meet the obligations set forth for Responsible Entities.

R1. In FERC Order No. 829, paragraph 59 states, “The new or modified Reliability Standard must address the provision and verification of relevant security concepts in future contracts for industrial control system hardware, software, and computing and networking services associated with bulk electric system operations.” The Order does not address requirements for EACMS, PACS, or PCA as identified in R1. The SDT should limit the requirement to the context of the Order.

R1.1.1. The obligation to “identify and assess risks” is extremely open-ended and ambiguous. In contrast, the draft Technical Guidance and Examples document enumerates a list of 11 factors that should be considered in an entity’s plan. NERC standards should be clear on their face, and it is inappropriate to require and entity to refer to draft Technical Guidance and Examples document for fundamental questions concerning whether an entity is compliant with a given requirement. If the Drafting Team believes that this list of 11 factors within the draft Technical Guidance and Examples document is a comprehensive list of factors that should be considered when “identifying and assessing

risks," these factors should be listed in the standard as the exhaustive set of factors to be assessed. If the Drafting Team does not believe this list is complete or appropriate, an alternate list of factors should be provided. Without clear requirements on the factors to be considered, there is substantial risk in inconsistency of implementation by entities.

R1.1.1. The use of the term "deployment" can be read to require an ongoing obligation even after the software or hardware is in production. To avoid confusion, the term "deployment" should be removed.

Q1-Issue1-Discussion

(1) In reviewing the measures M1, R1 is written in a manner to collect evidence to achieve two objectives; (i) documentation of the plan, and (ii) documentation to demonstrate implementation of the plan(s). According to NERC's Drafting Team Reference Manual which was recently revised and published October 19, 2016, on page 11 under section B – Requirements and Measures (http://www.nerc.com/pa/Stand/Resources/Documents/Drafting%20Team%20Reference%20Manual_Oct2016_final.pdf), each requirement should "achieve one objective." The Reference Manual goes on to state: *If a requirement achieves two objectives, such as developing a document and distributing that document, then each objective should be addressed in its own requirement.* Contrary to instructions delineated in the Reference Manual, R1 requires Entities meet two objectives, develop **and** implement the supply chain risk management plan.

Q1-Issue1-Recommendation

GTC recommends R1 be separated into two separate requirements where the first objective of the FERC directive identified in paragraph 2 is addressed to "develop a plan" (R1), and the second objective is addressed in its own requirement to "implement the plan" (new R2). This method simplifies compliance documentation for the Responsible Entity and aligns with the principles documented in NERC's Reference Manual. Additionally, this method will simplify and provide clarity to achieve FERCs directive for the plan to be forward-looking as explained in further detail below.

Q1-Issue2-DISCUSSION

(2) The SDT has clarified in the rationale for requirement R1 that the implementation of the cyber security risk management plans(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts, consistent with Order No. 829 as specified in the Implementation Plan. Additionally, Paragraph 59 stipulates to address security concepts in "future contracts". However, GTC does not see this forward looking language in the actual Requirement R1 that is specified by the FERC Order. GTC believes this forward looking language can be better clarified and highlighted if the SDT accepts GTC's first recommendation to separate R1 into two requirements and "implement the plan" is written as its own requirement.

Q1-Issue2-Recommendation

GTC recommends the following:

Separate R# to implement plan(s), then update the new Requirement with the following language: "Each Responsible Entity shall implement the documented supply chain risk management plan(s) specified in Requirement R1. Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts."

Q1-Issue3-DISCUSSION

(3) Paragraph 45 of Order No. 829, clearly specifies "The Plan" should address, at a minimum, four specific security objectives in the context of addressing supply chain management risks.

(P. 45) The plan required by the new or modified Reliability Standard developed by NERC should address, at a minimum, the following four specific security objectives in the context of addressing supply chain management risks: (1) software integrity and authenticity; (2) vendor remote access; (3) information system planning; and (4) vendor risk management and procurement controls.

Although R1 technically covers the four specific security objectives, the presentation lends itself somewhat confusing. R1.2.5 seems to align with security objective (1), R1.2.6 seems to align with security objective (2), and are both subsets to R1.2 which seems to align with security objective (4).

Q1-Issue3-Recommendation

GTC believes R1 will be clearer to understand and that the drafting team could gain more support if the four specific security objectives required by Order 829 Paragraph 45 had their own individual sub-requirement of "The Plan", in lieu of sub-requirements of one of the security objectives such as:

R1.1 aligns with security objective 3 (*information system planning*) where the specifics of the third objective identified in paragraph 56 is captured as a subset of R1.1;

R1.2 aligns with security objective 4 (*vendor risk management and procurement controls*) where the specifics of the fourth objective identified in paragraph 59 is captured as a subset of R1.2;

R1.3 to align with security objective 1 (*software integrity and authenticity*) where the specifics of the first objective identified in paragraph 48 is captured as a subset of R1.3; and

R1.4 to align with security objective 2 (*vendor remote access*) where the specifics of the second objective identified in paragraph 51 is captured as a subset of R1.4.

Q1-Issue4-DISCUSSION

(4) Order 829 Paragraph 58 refers to NIST Special Publication 800-53 for various supply chain development life cycle controls. The definition of Supply Chain from NIST SP 800-53 r4 states that the "supply chain horizon" ends at the delivery of products/services to the acquirer. FERC Order 829 acknowledges this definition in paragraph 32, footnote 61.

Supply Chain: “Linked set of resources and processes between multiple tiers of developers that begins with the sourcing of products and services and extends through the design, development, manufacturing, processing, handling, and delivery of products and services to the acquirer”

Accordingly, in the system lifecycle, the supply chain management process occurs prior to the identification of a Cyber Asset as a BES Cyber System pursuant to the implementation of CIP-002-5.1a. This designation must only occur “upon commissioning” for planned system installations (and even later for unplanned changes). Therefore, BES Cyber System identification, categorization as high, medium, or low impact; and also identifying associated EACMS, PACS, and PCAs does not exist during the supply chain context. Therefore, R1 should be limited to a supply chain risk management plan which will address controls for mitigating Supply Chain risks to hardware, software, and computing and networking services of Cyber Assets which are intended to support Bulk Electric System operations as specified in Order 829 paragraph 43.

Q1-Issue4-Recommendation

GTC recommends the SDT adopt the aforementioned NIST SP 800-53 defined term Supply Chain for use with CIP-013-1 R1 in front of the term “risks” to contain the Time Horizon to supply chain risk management, and also edit to account for the fact that BES Cyber System identification and categorizations do not exist during the supply chain context.

An example of R1 is provided:

R1. Each Responsible Entity shall document a Supply Chain risk management plan(s) that address controls for mitigating Supply Chain risks to hardware, software, and computing and networking services which are intended to support Bulk Electric System operations. The plan(s) shall address:

R1.1 The use of controls for mitigating Supply Chain risks associated with *information system planning*

R1.2 The use of controls for mitigating Supply Chain risks associated with *vendor risk management and procurement controls*

R1.3 The use of controls for mitigating Supply Chain risks associated with *software integrity and authenticity*

R1.4 The use of controls for mitigating Supply Chain risks associated with *vendor remote access*

Q1-Issue5-DISCUSSION

GTC disagrees with the inclusion of associated Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets in requirement R1. GTC finds no reference to the inclusion of these associated systems in FERC Order 829 and recommends their removal from this standard.

Further, GTC questions whether the use of the term BES Cyber Systems is appropriate in a standard which is limited per FERC Order 829 to "the context of addressing supply chain management risks." In the system lifecycle, the supply chain management process occurs prior to the identification of a Cyber Asset as a BES Cyber System pursuant to the implementation of CIP-002-5.1a. This designation must only occur "upon commissioning" for planned system installations (and even later for unplanned changes). Therefore, BES Cyber System identification, categorization as high, medium, or low impact; and also identifying associated EACMS, PACS, and PCAs does not exist during the supply chain context.

Q1-Issue5-Recommendation

GTC recommends the removal of any reference to Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets. GTC recommends removal of references to BES Cyber Systems and replacing it with the phrase "hardware, software, and computing and networking services which are intended to support Bulk Electric System operations."

R1.1 is acceptable in regard to requiring entities to have a plan to identify and assess risks with procured equipment. R1.2 is unacceptable because Entity creation of Detective Controls for the four Objectives of P. 45 is considered out of the Entity's scope. If only one Entity and one Vendor existed, the individual sub-parts of R1.2 may be feasible for control planning – but this approach is not viable for hundreds of

entities and dozens of vendors. The Entity is capable of identifying Preventative Controls, in concept, but they will only be effective if all the vendors in the supply chain make a diligent effort to implement the controls all the way back to the first-line suppliers. Corrective Action Controls are critical, but would be able to be implemented only after a problem is identified.

The requirement should focus on the risk of the software or services being procured and not allow for the possibility of a Registered Entity taking a risk view based upon the impact categorization of the BES Cyber System or EACMS, PACS, or PCA that is affected by the	

procurement. The requirement needs to clearly be focused on the vendor processes without regard to the Cyber Assets impacted by the vendor. The controls need to include processes for granting vendor access in addition to the processes for notifying when removal of access is necessary. The controls to grant access should include expectations for the conduct of training and personnel risk assessments, including review, modification as necessary, and acceptance of the vendor's process by the Registered Entity, if applicable, along with expectations of what evidence of compliance will be provided to the Registered Entity by the vendor. Part 1.2.4 should include an expectation of notification by the vendor in addition to coordination of the response.

1) The Rational for Requirement R1 includes a definition of the term “vendors”. This definition is also included in the Guidelines and Examples document. This term should be officially defined.

2) It is not clear if R1 applies to high, medium and low since R3, R4 and R5 specify the impact level. The high, medium, low impact level applicability would be much easier to understand if this standard were written to be consistent with CIP-004 through CIP-011 through the use of Applicability Tables.

3) R1.1 is vague in the language used with terms like “assess risk” and “evaluate”. The need to revise CIP-002 shows the difficulties that have occurred when entities are required to assess risk. Request that the SDT encourage NERC to include in the CIP-013 RSAW, language similar to that used in the CIP-003-7(i) RSAW, Attachment 1 Section 4, possible Notes to Auditor:

“The entity must document its determination as to what are the supply chain risks. Once this determination has been made and documented, the audit team’s professional judgement cannot override the determination made by the Responsible Entity. “

For R1: With respect to the obligation to “identify and assess risks,” the standard is extremely open-ended. In contrast, the Compliance Guidance enumerates a list of 11 factors that should be considered. NERC standards should be clear on their face, and it should not be necessary to refer to Compliance Guidance for basic questions concerning whether an entity is in compliance with a given requirement. If the Drafting Team believes that this list of 11 factors is a comprehensive list of factors that should be considered when “identifying and assessing risks,” these factors should be listed in the standard as the exhaustive set of factors to be assessed. If the Drafting Team does not believe this list is complete or appropriate, a complete list of factors should be provided. Without clear guidance, as to factors that should be considered, there is substantial compliance risk if a subjective auditor disagrees with the risk factors identified by an entity

R 1.1.1 – The use of the term “deployment” can be read to require an ongoing obligation even after the software or hardware is in production (i.e. once deployed). To avoid confusion, the term “deployment” should be removed or clarified.

4) For R1: This requirement requires both the development and the implementation of a plan. Recommend breaking this into three steps, which follows CIP-014 – Entity to a) identify risk, b) develop a plan, c) implement plan in future contracts.

5) For R1: We recommend stating the responsible entity is not required to renegotiate or abrogate existing contracts. The rationale from R1 states that “Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan.” This should be incorporated into the Requirement itself.

6) For R1.1 and the R1 Rationale: The R1 Rationale and the Guidance document list "planning, acquisition and deployment" and versions of these terms in the diagram. R1.1 uses "planning and development". The meaning of "development" has not been clarified and is not part of the process addressed by this standard. Suggest that "development" be clarified or removed.

7) For R1.1.2: We seek further clarification of the intent. As, written the requirement is ambiguous:

a. Is the intent to have the entity evaluate potential methods to mitigate risk? or;

b. To evaluate the effectiveness of mitigating that risk? or;

c. Is it meant to identify the controls in place to mitigate the identified risks?

8) For R1.2.1: The words "Security Event" are in quotes the first time that they are used in the Guidelines and Examples document (page 6). If the Guidelines and Examples document is providing a definition to be applied here, then" Security Event" should be replaced or clarified in the Requirement. This clarification could include "any identified, threatened, attempted or successful breach of the vendor's components, software or systems used in the support of the Entity's BES Cyber System." This new language differentiates R1.2.1 from the vulnerabilities in R1.2.3

9) For R1.2.1: Page 6 of the Guidance and Examples document list both notification from the vendor and notifications from the entity. The R1.2.1 language is unclear in requiring both notifications. Request an update to the Guidance and Examples or the Requirement, for consistency.

10) For R1.2.2: The requirement for the" process for notification" is very different than the "request vendor cooperation" guidance given on page 6, line 22 of the guidance document the requirement as written would require that a process be defined and implemented. The failure of a vendor to notify the entity would, at a minimum be a violation of the entities process or maybe even a compliance violation as a failure to implement the process. Would like to see an additional statement in the requirement language that "A failure of a vendor to follow a defined process is not a violation of this Requirement."

For R1.2: A newly added (in the 1/19/17 draft) sentence in the Rationale (R1) section states: "Implementation of elements contained in the entity's plan related to Part 1.2 *is accomplished* through the entities procurement and negotiation process. Who determines whether it was a sufficient effort to "implement the elements" as part of the procurement and negotiation process? What if you take their first "no" for an answer – is that sufficient effort to implement? Who gets the final sign off?

11) Request clarification - May a responsible entity's procurement plan identify and mitigate risks without requiring vendor involvement for each identified risk?

The Compliance Guidance states: “Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts, consistent with Order No. 829 (P 36) as specified in the Implementation Plan.” What qualifies as an *existing contract*? Is there an obligation to implement the risk management plan when: (1) negotiating and executing a new Statement of Work; (2) negotiating an amendment to a Master Agreement; or (3) renewing a contract under existing terms? The answer to these questions should be clarified and directly addressed in the standard.

Requirements overlap with existing CIP standards and create double jeopardy situations. Change 1.2.7 from pointing to 1.1.2 to 1.1.1

The following statements from the R1 Rationale box are important caveats for compliance and should be included in the Requirement text:

“Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts.”

“Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan.”

- What is meant by “if applicable” in the Requirement. If this means EACMS/PACS/PCAs for high and medium impact BES Cyber Systems, then state this.

• Extending the applicability to all BES Cyber Systems and associated EACMS/PACS/PCAs results in an unfathomable expansion in scope. For example, in a small Medium Impact Control Center BES Cyber System, we have between 50 and 60 individual software and hardware contracts to manage. Most common industry practices would base the procurement policies for these contracts based on their financial risk, or contracts above a certain spending threshold. However, managing cyber risk does not relate to spending. A million-dollar EMS system could carry less cyber security risk than a $20 camera or a one thousand-dollar network switch. This implies a centralized procurement office for all purchases, since each potential purchase needs to be evaluated for the Cyber Security risk it presents. This would have tremendous costs for smaller entities. We suggest limiting the scope to high and medium impact BES Cyber Systems. • 1.2.3 should read “known [security] vulnerabilities”. Vulnerabilities include any weakness in the code. • What does coordination mean in 1.2.4 and 1.2.6? • Remove 1.2.7. This does not belong in a mandatory and enforceable Standard. As it stands, an entity is required to add other indeterminate processes.

FERC didn't specifically ask for Low Impact BES Cyber Systems to be included but didn't explicitly exclude them either. SunPower does not believe Low Impact Cyber Systems should have to meet the same expectations of High and Medium Impact Cyber Systems. While we appreciate the efforts of the SDT to meet the expectations of the FERC Order, we believe the SDT may have gone beyond what FERC was asking them to do.

CIP-003-6 does not require Entities with Low Impact Cyber Systems to have to list the BES Cyber Systems, with this new requirement, do Entities lose their exception? If there is an expectation of that Low Impact Cyber System Entities must adhere to the same or lesser requirements as High and Medium Impact Cyber System Entities, then perhaps CIP-003 would be a better place for the exception. SunPower believes CIP-013, as written, is in direct conflict with the intent of CIP-003-6.

Oxy disagrees that R1 should be applicable to low impact BES Cyber Systems. Although FERC is silent on whether low impact should be included, Paragraph 2 of Order No. 829 says "nor does the Commission require NERC to propose "one-size-fits-all" requirements. The new or modified Reliability Standard should instead require responsible entities to develop a plan to meet the four objectives, or some equally efficient and effective means to meet these objectives, while providing flexibility to responsible entities as to how to meet those objectives." The language of R1 elevates low impact BES Cyber Systems to the level of medium and high impact BES Cyber Systems. For example, R 1.2.2 requires a process for when vendor employee remote or onsite access should no longer be granted. Under existing CIP Standards, Access Management Program requirements reside in CIP-004 and none are applicable to low impact BES Cyber Systems. R 1.2.5 requires processes for verifying software integrity and authenticity of all software and patches that are intended for use. Under existing CIP Standards, Security Patch Management requirements reside in CIP-007 and none are applicable to low impact BES Cyber Systems. Additionally, software and patching typically occurs at the Cyber Asset level and low impact entities are only required to identify assets containing low impact BES Cyber Systems. As currently written, R1 and its sub-requirements seem to require an inventory of Cyber Assets or BES Cyber Systems, neither of which are required of low impact entities, which is another element that elevates low's to that of medium and high. Using a risk based approach, it seems more appropriate that R1 be applicable to medium impact and high impact only. The risk assessments are required and performed under CIP-002 and the determination made that low impact BES Cyber Systems pose	

a minimal threat to the BES. Finally, under the existing CIP suite of standards, requirements applicable to low impact entities reside in CIP-003. If a risk management plan is to be required, low impact with a reduced set of requirements to address their minimal BES risk, Oxy requests that those requirements be included as an element of R5 so all the low impact requirements are together or, ideally, included in CIP-003 along with the content of R5. Oxy also requests that CIP-013-1, R1 be rewritten to be applicable to medium and high impact BES Cyber Systems only.

- Regarding R1.2.1, vendors will unlikely to share security events. Registered Entities should not be held accountable for compliance obligations in which they have no control of.
- Regarding R1.2.1, the Standard Drafting Team should clarify what is intended by, “vendor security event.” This is an ambiguous term which can have different meanings.
- Regarding R1.2.3, the Standard Drafting Team should clarify what is intended by, “known vulnerabilities.” This is an ambiguous term which can have different meanings.
- Regarding R1.2.4, the Standard Drafting Team should clarify what is intended by, “cyber security incidents.” This is an ambiguous term which can have different meanings.
- Regarding R1.2.4, vendors will be unlikely to share cyber security incidents. Registered Entities should not be held accountable for compliance obligations in which they have no control of.

• Regarding R1.2.5, this requirement is duplicative of CIP-007-6. The Standard Drafting Team should clarify how proposed requirement would be completed within the Procurement phase. • Regarding R1.2.6, this Requirement is duplicative of CIP-005-5. .

The scope of the requirement is not clear due to the phrase "if applicable." Please clarify how an entity would determine if their Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets are applicable. Due to some vendors offering many of their products and services outside of the electric utility industry (Microsoft, Cisco, Symantec, GE…) there is a concern that entities will lack leverage when negotiating these new terms and will likely find it difficult to come to an agreement. There are also instances where there are very few options available to industry for a particular product, device, or service. Does the SDT envision that registered entities would be forced to find alternative vendors or products if they are unable to come to an agreement? It is not clear if the requirements are only applicable to new software purchases or also apply to upgrades of existing software (including adding additional licenses for existing software) or renewals of software maintenance contracts that provide software upgrades of existing software. If the existing software is already in place, there is concern that there will be the lack of leverage to require vendors of existing software to negotiate new terms.

The need for such a broad set of requirements is unnecessary due to the existing CIP requirements for the entity to have an incident response plan, anti-virus protection and patch management. To the extent the following items remain in R1, NRECA proposes the following actions:

R1.2 – Recommend deleting text after "BES Cyber Systems" as the text is unnecessary.

R1.1.1 – Clarify what is meant by "vendor security events."

R1.2.3 – What is the basis for determining what are "known vulnerabilities?"

R1.2.4 – Clarify the scope of this language as it seems unnecessarily open-ended.

R1.2.5 – Clarify that this item is for BES Cyber Systems only.

R1.2.7 – Delete as it is unclear and unnecessarily open-ended.

EPE shares the comments and concerns voiced by the Edison Electric Institute (EEI) in this Ballot #1. Please refer to the EEI ballot for detailed comments on each of the proposed requirements; however, EPE would like to emphasis one issue that is at the forefront of its concerns:

The proposed language of the requirements (especially Requirement 1.2) speaks in terms of using controls that "address process(es)," and yet, the contents of the requirements include "verifying software integrity." Responsible Entities are familiar with various existing CIP requirements that mandate the development of "processes," but in CIP-013-1, the inclusion of responsibility for verifying software integrity places a Responsible Entity in a conundrum not present in the other Reliability Standards. Must a Responsible Entity start hiring employees with software capabilities equal or better than the software developers on the staff of the vendors who have historically supplied software products to the industry? If so, how long will that take and at what cost to ratepayers, and can a third party effectively or efficiently create a pool of talent superior to the actual developers of the vendor's software itself?

Perhaps there is room in the standard for a Responsible Entity to simply require in its processes that any vendor will provide an attestation to the Responsible Entity that the vendor's software product is authentic and has integrity for the intended use, making this type of attestation a means of complying with the verification requirements found throughout CIP-013-1 in its proposed form. If so, the current wording of the draft standard does not plainly or clearly say so.

EPE understands the objective of the standard, and the Commission's desire to tackle the risks that stem from third party vendors whose work may impact the BES. Our participation in the balloting process for this standard is with the goal of arriving at language that is clear and that enables a Responsible Entity to comply.

The applicability of this requirement should be limited to high and medium impact BES Cyber Systems. Low impact Cyber Systems are categorized as low impact because they inherently have a low ability to negatively impact the Bulk Electric System. We should focus our resources on those systems that have the potential for significant adverse impact on the BES. We can re-evaluate at a later date whether additional requirements should be established for low impact BES Cyber Systems.

Using "if applicable" adds confusion to the language. If it is not always applicable to associated Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets, define where it is applicable and where it is not.

We're concerned that the word "Evaluate" in requirement 1.1.2 might imply that all possible methods for addressing the risks will need to be evaluated. We prefer replacing the term "Evaluate" with "Identify". Additionally, there may be occasion where a risk is identified but is judged to be at an acceptable level given the ability or inability to address it. This standard, in its entirety, should be about minimizing the risks and/or providing reasonable assurance which may result in some instances where the entity will accept a certain level of risk as reasonable. Therefore, we propose the following language: 1.1.2. Identify methods to address the above risk(s), as needed.

Requirement 1.2.1 requires "Process(es) for notification of vendor security events". CIP-007-6 R4 Security Event Monitoring includes a requirement for generating alerts for security events. Assuming that Requirement R1.2.1. is intended to mean the entity will have a process to encourage and direct vendor notification to the client, we suggest this be included in the language of CIP-007.

Requirement 1.2.2 requires "Process(es) for notification when vendor employee remote or onsite access should no longer be granted" The revocation of access, including Interactive Remote Access is currently addressed in CIP-004-6 R5. If this is attempting to require something above and beyond those requirements, it should be made clear what that is and consideration given to housing all of these requirements in CIP-004.

Requirement 1.2.3 requires "Process(es) for disclosure of known vulnerabilities". Is this asking for entities to have a process for the entity to disclose vulnerabilities? Who would we be disclosing to? If it's directed at vendors, the entity can discuss this with the vendor, but the vendor is under no obligation to disclose vulnerabilities and neither the entity, nor FERC, has the authority to require this. Vendors MAY disclose vulnerabilities, but that will likely occur concurrent with providing a fix/patch.

Requirement 1.2.4 requires a "Coordination of response to vendor-related cyber security incidents". From our understanding of what this requires, we believe this is already covered in the entities cyber security incident response plan (CIP-008).

Requirement 1.2.7 requires “Other process(es) to address risk(s) as determined in Part 1.1.2, if applicable”. While we understand what this requirement is intending to do, we believe it is may lead to second-guessing by auditors and/or unrealistic auditor expectations.

The proposed language of the requirements (especially Requirement 1.2) speaks in terms of using controls that “address process(es),” and yet, the contents of the requirements include “verifying software integrity.” Responsible Entities are familiar with various existing CIP requirements that mandate the development of “processes,” but in CIP-013-1, the inclusion of responsibility for verifying software integrity places a Responsible Entity in a conundrum not present in the other Reliability Standards. Must a Responsible Entity start hiring employees with software capabilities equal or better than the software developers on the staff of the vendors who have historically supplied software products to the industry? If so, how long will that take and at what cost to ratepayers, and can a third party effectively or efficiently create a pool of talent superior to the actual developers of the vendor’s software itself?

Perhaps there is room in the standard for a Responsible Entity to simply require in its processes that any vendor will provide an attestation to the Responsible Entity that the vendor’s software product is authentic and has integrity for the intended use, making this type of attestation a means of complying with the verification requirements found throughout CIP-013-1 in its proposed form. If so, the current wording of the draft standard does not plainly or clearly say so.

EPE understands the objective of the standard, and the Commission's desire to tackle the risks that stem from third party vendors whose work may impact the BES. Our participation in the balloting process for this standard is with the goal of arriving at language that is clear and that enables a Responsible Entity to comply.

Elizabeth Axson - Electric Reliability Council of Texas, Inc. - 2	
Answer	No
Document Name	Final_Unofficial_Comment_Form_2016-03_03162017_ERCOT comments.docx
Comment	

ERCOT supports the IRC comments and offers the following supplemental comments.

FERC Order 829, Paragraph 59, states that NERC's new or modified standard "must address the provision and verification of relevant security concepts in future contracts for industrial control system hardware, software, and computing and networking services associated with bulk electric system operations." This does not include the Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS), and Protected Cyber Assets (PCAs) listed in R1. These systems do not perform or provide bulk electric system operations. ERCOT believes the inclusion of these systems in the draft standard goes beyond the scope of the standard intended by FERC and recommends the SDT remove them from the applicable systems of the standard language.

Requirement R1 requires Responsible Entities to have a plan that addresses processes for notification of a vendor's cyber security events (R1.2.1) and vulnerabilities (R1.2.3), as well as coordination of cyber security incident response activities (R1.2.4). As this information is highly sensitive, it is unlikely that all vendors will agree in all cases to provide this information unless they are already required to do so under other regulatory obligations. Responsible Entities cannot force a vendor to agree to these terms, and in cases where the vendor deems the risk of this disclosure too great compared to the value of the contract, the vendor will decline to enter into the agreement. This will force the Responsible Entity to seek another vendor that is willing to accept these terms, and such a vendor may or may not exist. Because it is possible that a Responsible Entity may be unable to identify a vendor that is willing to accept a contract with the terms required by R1, the proposed standard could seriously hamper the essential functions of Responsible Entities. To address the concern, the drafting team should

include a limited exemption from compliance, such as a Technical Feasibility Exception (TFE), which would protect Responsible Entities in the event a vendor is unwilling to agree to the terms otherwise required by R1. NERC's Appendix 4D to the Rules of Procedure provides for a basis of approval of a TFE beyond strict technical limitations of a system. (See Section 3.0 of the appendix.)

Requirement R1.2.2 requires "notification when vendor employee remote or onsite access should no longer be granted." The revocation of access, including Interactive Remote Access, is currently addressed in CIP-004, R5. Since the background checks, training, access authorization, and access revocation for employees and vendors is already addressed in CIP-004, the drafting team should ensure any new requirements related to access revocation of vendors be placed in CIP-004. In developing the CIP Version 5 standards, extensive work was undertaken to ensure that all requirements related to the subject were included in one standard instead of being spread across multiple standards. The proposed language will disrupt that framework.

Requirement R1.2.5, which requires a Responsible Entity's plan to include "Process(es) for verifying software integrity and authenticity of all software and patches that are intended for use," is duplicative of Requirements R3 and R5 within this standard, which also require documentation of processes. ERCOT recommends removing R1.2.5.

Requirement R1.2.6 requires an entity's plan to include "Coordination of remote access controls for (i) vendor-initiated Interactive Remote Access and (ii) system-to-system remote access with a vendor(s)." This requirement is duplicative of Requirement 4 within this standard. ERCOT recommends removing Requirement R1.2.6, which also requires documentation of processes.

Alan Farmer - ACEC/Burns & McDonnell - NA - Not Applicable - NA - Not Applicable	
Answer	Yes

Document Name	
Comment	

While in overall agreement with Requirement 1, ACEC does have the following concerns:

1. Part 1.1 requires the Responsible Entity to identify and assess risk(s) and evaluate methods to address identified risks. This requirement specifically changes the methodology for risk assessment defined in CIP-002-5.1. As noted in the Background section (Section 6) of the standard, "This general process of categorization of BES Cyber Systems based on impact on the reliable operation of the BES is consistent with risk management approaches for the purpose of application of cyber security requirements in the remainder of the Version 5 CIP Cyber Security Standards." This view of risk based upon the impact of BES Cyber Assets based upon the impact to the BES, not the devices cyber security risk, was defended by NERC and approved by FERC in Order 791 approving Version 5 of the CIP Standards. Based upon this, it would be consistent with CIP-002-5.1 to remove Part 1.1 of Requirement 1, modify requirement R1, Part 1.2.7 to state "other process(es) to address risk(s) as determined in CIP-002-5.1 R1, Parts 1.1 and 1.2" and to add to requirement R1 that it only applies to high and medium impact BES Cyber Systems as used in R3 and R4.

2. In the Rationale for Requirement R1, the term vendor is defined as "(i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators." ACEC is concerned that by including product resellers or vendors, who have no direct or indirect control of these areas, misapplication of the procurement language in this Standard would impose unrealistic obligations, standards of care, and potential liability on professional services related to the supply chain. As a consequence, services currently provided by engineering firms may be uninsurable under current professional liability insurance policies. Other industries supporting the supply chain have raised similar concerns, noting that the effect of this approach will be to stifle competition, impair innovation, and increase costs.

Specifically, the guidance language in this Standard includes "integrator" requirements that impose responsibilities on engineering firms and other supply chain elements for control of software development; personnel management systems; industrial system controls (SCADA); and long- term or post-contract reporting/remediation requirements (vulnerability testing and mitigation). Engineering firms do not typically develop such software and hardware, yet the guidance language suggests they should assume such liability for their use. They also do not monitor and report vulnerabilities for vendor software and hardware. This "one-size-fits-all" approach amounts to a significant reallocation of risk, imposing liability on engineering firms that they can neither manage, nor price. The result will be fewer firms willing to perform

services for this industry. This requirement should be modified to limit the scope and responsibilities to the vendor and end user to ensure risk is apportioned to the responsible parties.

Requirement R1 requires a documented 'supply chain risk management plan', AZPS requests clarification and renaming of the plan to 'vendor risk management plan' throughout the Standard as this term more appropriately describes the content that is required to be included in the plan. Also, the statement …'the plan(s) shall address:' seems redundant and potentially creates a distinction that is not intended. AZPS recommends striking the last sentence and appending …'including' to the first sentence of Requirement R1. Finally, AZPS recommends revising the language of Requirement R1 to focus on BES Cyber Systems and to allow the plan content to address when the associated "Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets" are brought into the scope of such plans as follows:

R1. Each Responsible Entity shall implement one or more documented ***Vendor*** risk management plan(s) that address controls for mitigating cyber security risks to BES Cyber Systems, ***including***: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. The use of controls in BES Cyber System planning and development to:

1.1.1. Identify and assess risk(s) during the procurement and deployment of vendor products and services; and

1.1.2. Evaluate methods to address identified risk(s).

1.2. The use of controls in procuring vendor product(s) or service(s) that address the following items, to the extent each item applies to the Responsible Entity's BES Cyber Systems:

1.2.1. Process(es) for notification of vendor security events;

1.2.2. Process(es) for notification when vendor employee remote or onsite access should no longer be granted;

1.2.3. Process(es) for disclosure of known vulnerabilities;

1.2.4. Coordination of response to vendor-related cyber security incidents;

1.2.5. Process(es) for verifying software integrity and authenticity of all software and patches that are intended for use;

1.2.6. Coordination of remote access controls for (i) vendor-initiated Interactive Remote Access and (ii) system-to-system remote access with a vendor(s); and

1.2.7. Other process(es) to address risk(s) as determined in Part 1.1.2, if applicable.

1.3. The applicability of controls to associated Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets.

AZPS also requests that two (2) definitions utilized in the Technical Guidance and Examples be proposed for inclusion as defined terms in the standard, “Security Events” and “Vendor.” Specifically, AZPS notes that Requirement R1.2.1 uses the term “security events” as an undefined term in the Standard, but that the Technical Guidance and Examples, Page 6, uses “Security Events” as a defined term. AZPS requests consistency between the two documents and the addition of the defined term “Security Events” to the Standard. Additionally, AZPS requests the removal of ‘identified, threatened, attempted’ from the defined term and require only notification of ‘successful breach of vendor’s components, software or systems that have potential adverse impacts to the availability or reliability of BES Cyber Systems’. Further, the Rationale for Requirement R1 defines the term “vendors” as ‘(i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators’, AZPS requests incorporating this definition in the Standard for specificity of scope.

AZPS requests clarification regarding the term “processes” as used in Requirement R1.2. In particular, AZPS requests clarification that these items or “processes” are to be included in the overall plan and do not require a separate process or process documentation. Finally, the

Rationale for Requirement R1 states that “obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement the Entity’s plan;” however the Requirement does not make clear that the failure of contract negotiations to result in specific controls would not be considered a failure to implement.

Sheranee Nedd - Public Service Enterprise Group, Public Service Electric & Gas, PSEG Fossil LLC, PSEG Energy Resources & Trade LLC - 1,3,5,6 - NPCC,RF, Group Name PSEG REs	
Answer	Yes
Document Name	
Comment	

PSEG agrees with the intent of this requirement, but has the following questions/recommendations below:

- The term vendors as used in the standards is defined in the Rationale for Requirement R1 box. This term should be officially defined in the Glossary of Terms used in NERC Reliability Standards.

- Is requirement R1 applicable to new additions and/or modifications to existing BES Cyber Systems? There is not sufficient information to determine if this requirement is applicable only to new BES Cyber Systems or if it also includes changes to existing BES Cyber Systems.

- The applicability of Requirement R1 to High/Medium/Low BES Cyber systems and EACMs, PACs and PCAs is not clear the way it is written. Recommend using the applicability tables as in CIP-004 through CIP-011 for the requirements in this standard, especially R1.

- Requirements 1.2.1 through 1.2.6 discuss processes for vendor controls but some of the controls are unclear as to who is expected to perform the “notification”. For each sub-requirement, PSEG recommends adding clarity in the requirement language indicating who is expected to perform the notification, the vendor or the registered entity.

• Requirement 1.2.1 discusses a vendor security event. This is a vague term. The standard should include more clarification on what a vendor security event is or define the term.

Comment	

Southern Company strongly encourages the SDT to consider the below edits, which use phrasing directly from the FERC Order. If R1 is intended to address the true supply chain procurement side of things, then the proposed edits provided below appropriately scope this requirement at the 'main R' level. The Order 829 Summary, and paragraphs 10 and 24 of the Order specify controls for vendors that supply "industrial control systems" products and services. Therefore, R1 should be focused on to what vendors and what software/firmware this requirement should be limited. The expansion of scope at this stage to propose including all impact classifications of BES Cyber Systems and their associated EACMS, PACS, and PCAs is above and beyond the Order, in our opinion. It's absolutely unmanageable if not restricted somehow to higher level systems. In CIP audits, "BES Cyber Systems" immediately turn into a list of hundreds or thousands of "programmable electronic devices."

The proposed edits provided below move the "planning and procurement" phases of the lifecycle up from sub-requirements 1.1 and 1.1.1 to the main requirement so that all of the sub-requirements under R1 are appropriately scoped as well. Without this, for example, R1.2 applies to all risks at all times throughout the entire lifecycle of all devices. It's cleaner to have the 'main R' be about the plan and setting the scope of the plan, and then have the sub-requirements address the plan(s) specifics. Consistent with Order 829, language from the rationale section addressing the "forward-looking" nature of this new requirement(s) has been incorporated into the main R1 requirement itself. Modifications highlighted below in R1.2.5 are recommended to eliminate redundancy and avoid confusion, while also addressing the specifics in the Order for dealing with "cyber incidents." The order of the sub-requirements of R1.2 have also been adjusted to more clearly align with the planning and procurement life-cycle, while at the same time continuing to address directives in the Order.

Additionally, Southern Company agrees with comments submitted by Georgia Transmission Corporation (GTC), specifically with regard to defining the term "Supply Chain" in accordance with the Order-referenced NIST 800-53 defined term which establishes the applicable time horizon for this Standard, and removal of references to Electronic Access Control and Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets.

Modify the R1 language as follows:

R1. Each Responsible Entity shall implement one or more documented supply chain risk management plan(s) that address controls for mitigating planning and procurement cyber security risks for industrial control system vendor products and services used in BES Cyber Systems. Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts. The plan(s) shall address: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1 Process(es) for the identification and assessment of risk(s) *of industrial control system vendor products and services*.

1.2 Methods to evaluate controls to address identified risk(s) in R1.1, that includes the following:

1.2.1 Coordination of remote access controls for (i) vendor-initiated Interactive Remote Access and (ii) system-to-system remote access with a vendor(s);

1.2.2 Process(es) for notification when vendor employee remote or onsite access should no longer be granted;

1.2.3 Process(es) for verifying software integrity and authenticity of all software and patches that are intended for use;

1.2.4 Process(es) for disclosure of known vulnerabilities in vendor products;

1.2.5 Process(es) for notification of and coordination of response to vendor-related cyber security incidents; and

1.2.6 Other process(es) to address risk(s) as determined in Part 1.1, if applicable.

The draft Requirement R1.2 language creates compliance concerns due to the need for Responsible Entities to negotiate commercial contracts with vendors that commit the vendors to undertake the tasks necessary for R1.2, particularly in circumstances where only a single vendor has the capability of providing the necessary services for Cyber Assets covered by CIP-013-1. For example, unless a vendor agrees to notify the Responsible Entity of vendor-identified vulnerabilities in the Cyber Assets provided or maintained by the vendor, Responsible Entities cannot comply with R1.2.3.

Responsible Entities could encounter scenarios where:

• Vendors may refuse to comply with the Responsible Entity's vendor controls;

• Vendors may demand an unreasonably high payment for compliance with the Responsible Entity's vendor controls;

• Vendors may agree to Responsible Entity controls but fail to take the steps necessary to implement those controls in a compliant manner; or

• Software/firmware made by a vendor no longer in business and unable to assist the Responsible Entity in the integrity and authenticity verification process.

To ensure that compliance with CIP-013-1 does not place Responsible Entities in an untenable negotiating position, a compliance "safety valve" is necessary to allow Responsible Entities to comply with the Standard even in the absence of vendor assent to the Responsible Entity's required controls. Such a "safety valve" would be consistent with the current draft guidance on CIP-013-1 R1.2, which states that "[o]btaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan."

Guidance language in the G&TB portion of a Standard is helpful, but the "safety valve" concept should be included within the language of the Requirement itself because only that language forms the basis of a compliance assessment.

Exelon has sent ideas under separate cover to the Drafting Team Chair outlining three options for providing the necessary “safety valve” along with proposed text edits to the requirements. In short, these options include a technical feasibility exception, a commercial feasibility exception or a simple exception documentation process.

2. The SDT developed CIP-013-1 Requirement R2 to address the Order No. 829 directive for entities to periodically reassess selected controls and keep plans up to date with emerging cyber security supply chain risk management concerns and vulnerabilities (P 46). Do you agree with the proposed requirement? If you do not agree, or if you agree but have comments or suggestions for the proposed requirement provide your recommendation and explanation.

Summary Consideration. The SDT thanks all commenters. The SDT has revised the requirement to review supply chain cyber security risk management plans in response to stakeholder comments. The revised requirement is Requirement R3 in the second draft of CIP-013-1.

Specific comments and SDT responses are provided below:

Commenters recommended that the SDT clarify guidance that Responsible Entities must consider in periodic reviews; some commenters suggested removing Parts 2.1 and 2.2 because they were addressed in the main requirement. The SDT clarified requirements for Responsible Entities to review supply chain cyber security risk management plans every 15 months and removed administrative or ambiguous parts. Rationale section was reworded to indicate that the list of sources of information for reviews is an example for consideration by the Responsible Entity. Implementation Guidance provides an example of a way that a Responsible Entity could be compliant with the requirement.

Commenters recommended clarifying when Responsible Entities were required to obtain initial approval of supply chain cyber security risk management plans. The SDT has added initial approval to the Implementation Plan.

Commenters asked what the impact of implementation would be on contracts that were in development. The SDT intends for implementation to affect contracts that are initiated after the effective date of the standard. Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. The SDT added this information to the Implementation Plan.

The Rational for Requirement R2 lists several sources for supply chain vulnerabilities, but it is not clear what is considered a relevant source and whether the entity is required to review all sources of supply chain vulnerabilities which may be very burdensome. CenterPoint Energy recommends adding the specific sources of vulnerability information, such as E-ISAC or ICS-CERT in the requirement.

Comment	

- Dominion recommends that requirement R2 be replaced with the following:

"Each Responsible Entity shall review and update, as necessary, its supply chain cyber security risk management plan(s) specified in Requirement R1 related to procuring and installing unsecure equipment or software, the risk of unintentionally failing to anticipate security issues that may arise due to network architecture, unintentionally arise during technology and vendor transitions, and purchasing software that is counterfeit or that has been modified by an unauthorized party at least once every 15 calendar months, which shall include: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*"

Dominion is of the opinion that the activities specified in Part 2.1 are included in the language of R2. Dominion recommends modifying Part 2.1 and 2.2 as follows:

- 2.1 Revision(s), if any, to address applicable new supply chain security risks that include security considerations related to cyber security, and
- 2.2 The supply chain plan(s) shall be reviewed, updated as necessary, and approved by CIP SM or delegate at least once every fifteen (15) months.

Also see the recommendation for replacing this requirement as described in the comments for R1.

Darnez Gresham - Darnez Gresham On Behalf of: Dehn Stevens, Berkshire Hathaway Energy - MidAmerican Energy Co., 1, 3; - Darnez Gresham

Answer	No
Document Name	

Comment

Refer to our comments on R1.

We do not agree with the approach in R1 (and R2) of creating “plans” and the intent of the plans to “cover the procurement aspects of all four objectives.”

Order 829’s four objectives did not include creating “plans.” All four of the directives either direct or use examples of specific operational cyber security controls which are best addressed as revisions to CIP-002 through -011.

NERC’s Compliance Registry Summary of Unique Entities and Functions as of March 3, 2017, identifies 1,398 unique NERC entities. These entities range from entities with a couple breakers for low impact Facilities (lines), to entities operating gigawatts of low impact generation units to entities operating high-impact Control Centers for thousands of miles of medium impact Transmission Facilities, for example. All have BES Cyber Assets.

With respect to R2 as proposed, 1,398 entities would have to annually research information, including information which is readily available to be proactively provided by NERC to them. This diverts and dilutes registered entities' resources.

Chris Scanlon - Exelon - 1	
Answer	No
Document Name	
Comment	

Exelon feels that the R2.1 language is vague and has the potential to become administratively burdensome without a corresponding benefit to BES reliability. While Exelon agrees with the rationale that examples of sources of information that an entity could consider include guidance or information issued by the E-ISAC, this language should be included in the Requirement itself because only that language forms the basis of a compliance assessment. Exelon receives over 100 security-related messages regarding potential vulnerabilities per day from a myriad of sources. Without creating bounds around the sources to be considered as well as the periodicity for updates to supply chain cyber security risk management plan(s), the question of whether any or all of the messages should have been considered will be difficult, if not impossible, to evidence. Exelon points out that the E-ISAC already performs important filtering functions for the industry. Perhaps future Alerts issued by the E-ISAC could be enhanced to point out vulnerabilities that would require new mitigating controls in supply chain cyber security risk management plan(s). Without these limitations, each entity will need to develop processes and procedures to receive and filter information, define mitigating controls, update the plan(s) and obtain approvals which is inefficient at best and impossible to evidence at worst.

Further, Exelon suggests that while multiple updates to the plan(s) may occur within a year as new E-ISAC Alerts are issued, CIP Senior Manager Review and Approval should only be required every 15 months. Intermediate reviews and approvals, or reviews for minor changes, should be outside the scope of the Requirement.

Basin Electric would prefer low impact requirements be included in CIP-003 rather than CIP-013.	

The language of R2.1 appears redundant and not any different than what is already required in the language of the main requirement, R2. Suggest deleting R2.1.

• As previously stated, for consistency with other CIP Standards (e.g. Physical Security plans, Incident Plan, Recovery Plans, Information Protection program, etc..) , CIP-003 R1.1 should be expanded to include the Supply Chain Risk Management plan as part of the collective cyber security policies reviewed and approved by the CIP Sr. Manager at least every 15 months. And, applicability of supply chain risk management controls to assets that contain Low Impact BCS should be consigned to CIP-003, R1.2 and R2. • The NERC Glossary of Terms definition of CIP Senior Manager will require update to include CIP-013

1. Suggest deleting R2.1. The R2 language includes “review and update as necessary”. Additional evaluation of the revisions is an administrative task that does not enhanced BES security. Make corresponding changes to section M2.

2. For R2.2: Page 9 of the Guidance and Examples document states “Requirement R2 allows responsible entities to incorporate the review of CIP-013-1 into their annual CIP-003 review.” CIP-003-6 R1 does not allow delegates to review and approve. In addition, CIP-003 requires the review of Policies and not plans.

3. Request clarity on how revisions to the plan would need to be addressed for contracts that are in the process of being negotiated since this negotiation process may take months.

AECI supports the following comment from AEP: "R2 is applicable to all BES Cyber Systems and, as applicable, EACMS PACS and PCA. The philosophy used by preceding CIP standard drafting teams has been to write any requirements for low impact BES Cyber Systems in Attachment 1 of CIP-003 R2. AEP believes this is a practice that results in a greater potential for compliance of all Responsible Entities. AEP recommends that the essence of R2 be rewritten to address the lower risk associated with low impact BES Cyber Systems and moved to CIP-003 R2 Attachment 1. In addition, CIP-013-1 R2 should be rewritten to be only applicable to high and medium impact BES Cyber Systems."

R2 has no stated applicability and it is unclear whether the CIP Senior Manager approval required here is any different from the required approval under R5. It would be clearer if R2 were made into R1.3, with the clarification suggested in our comments above to clearly exclude Low BES Cyber Assets from this requirement and consolidate requirements for those assets under R5.

What is the target of the word “revisions” at the beginning of R2.1? Does revisions refer to modifications of the “supply chain cyber security risk management plan(s)” document itself? If so, then requirement is redundant in that R2, and consequently R2.1 could be interpreted to	

require entities to evaluate the revisions that were just completed. Or is the intent of “revisions” to direct REs to consult document(s) external to the standard when executing revisions?

3) Request clarity on how revisions to the plan would need to be addressed for contracts that are in the process of being negotiated since this negotiation process may take months.

SDT should clarify that existing contracts do not need to be renegotiated based on the 15-calendar month reassessment of the plan or other plan revisions.

Will NERC, E-ISAC or other sources referenced in Rationale issue annual updates for supply chain risk? How will an entity prove that all risks have been incorporated? Seems to imply scope creep from elements on R1. Is *necessity* in R1 defined by entity, NERC, or outside source?

GTC knows of no definitive source to identify “new supply chain security risks and mitigation measures.” Therefore, compliance with this requirement part becomes subjective thus is not auditable. Reviewing and updating the plan as necessary under the core R2 along with CIP Senior Manager approval per R2.2 should be sufficient to maintaining a quality cyber security supply chain risk management program. We recommend the removal of requirement part 2.1.

The rationale for Requirement R2 suggests that every Responsible Entity should assess all supply chain risks before updating the plan, which may be a very burdensome requirement that will be difficult to comply with and audit. Would a Responsible Entity be in violation if it didn't document that they read a particular DHS report? Also, the Requirement R1 plan is focused on methods to review, assess, and evaluate vendor and vendor product/service risk before entering into a contract with a vendor, these methods are unlikely to change all that much based on guidance issued by NERC or DHS and would be naturally covered by a periodic review and approval of the plan(s).

Also, part 2.1 requires an evaluation of revisions to address new supply chain security risks and mitigation measures. It is unclear how a revision to address a new supply chain security risk is different than a mitigation measure. A mitigation measure addresses a risk.

We recommend the following language for consideration by the SDT:

R2. Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval for its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months.

We feel that there should be some guidance on where to look for "emerging supply chain related concerns". If our company is using a particular source and miss a notification on another site, will we be penalized?

R2

IPC suggests the SDT consider re-structuring the proposed format for R2 to align with current enforceable standard format (see CIP-002-5.1 R2, R2.1, and R2.2):

The Responsible Entity shall: (1) Review and update, as necessary, its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months, (2) Evaluate revisions, if any, to address applicable new supply chain security risks and mitigation measures; and (Question) How does the SDT foresee this evaluation being measured and accomplished? (3) Obtain its CIP Senior Manager or delegate approval (Question) Is the CIP Senior Manager or delegate intended to be an approval of the plan every 15 months? If so, IPC recommends specifying the timing and what is being approved in the wording of the requirement.

IPC does not believe R2.2 provides any security measures or controls and is simply an administrative exercise. IPC recommends R2.2 be removed.

Though each of the objectives in Order 829 is addressed, Reclamation recommends a more simplified format for the requirements as the SDT originally suggested in the webinar on November 10, 2016. Reclamation recommends Requirement R2 should instead require entities to implement their supply chain risk management plan(s) developed in Requirement R1. Within each Requirement, the sub-requirements should distinguish between high, medium, and low impact BES Cyber Systems and other supporting systems. Reclamation recommends the implementation plan enforcement dates be staggered based on high, medium, and low impact for auditing purposes and to allow the associated risks and severity levels to be spelled out more clearly.

1. Requiring a greater level of testing, documentation, or security features from system integrators, suppliers, and external service providers may increase the price of a product or service, and increase the compliance burden for the industry. We recommend language addressing key questions, such as: at what time frame does the risk reduce to acceptable: Daily, weekly, monthly or yearly? How is the standard addressing acceptance of risk?

While it is not unreasonable to propose periodic review and reassessment to assure some minimum level of rigor, ultimately Registered Entities know that plans are living documents that must be supported by sound security practices implemented to stay apprised of emerging cybersecurity threats as they enter the landscape, and a 15-month reassessment is ill-equipped to support the pace of the ever-evolving threat landscape. The industry might be better served with language that supports a periodic review coupled with the need for ongoing and timely assessment and update of plans on an as needed basis when the impending threat warrants the action.

The SDT may want to reconsider the need and intended value for CIP Senior Manager approval for these reasons. 1.) While it is not unreasonable to propose an approval for plans of this nature, prescribing this as a CIP Senior Manager responsibility is inconsistent with other enforceable mandatory CIP Cyber Security Reliability Standards that limit these approvals to BES Cyber System populations, policy, and, exceptions (both CIP Exceptional Circumstances and Technical Feasibility Exceptions). 2.) The introduction of CIP Senior Manager or delegate approval may not provide the intended value for the complex range of jurisdictional, technical, economic, and business relationship issues. 3.) By NERC definition, as a technicality, please note that the scope of the CIP Senior Manager accountabilities is currently prescribed as CIP-002 – CIP-011 and would require amendment. 4.) Lastly, as a consideration, the SDT may want to revisit the need for this level of approval and to align the approach with the former efforts associated to the FERC filing of proposed retired standards for Project 2013-02 Paragraph 81, and the intent to eliminate requirements are administrative in nature only and therefore that do not provide security or reliability value.

1. Strike R2.1 because the R2 language includes "review and update as necessary" covers the FERC Order. Additional evaluation of the revisions is an administrative task that does not enhanced BES security. Make corresponding changes to section M2.

1. For R2.2: Page 9 of the Guidance and Examples document states "Requirement R2 allows responsible entities to incorporate the review of CIP-013-1 into their annual CIP-003 review." CIP-003-6 R1 does not allow delegates to review and approve. In addition, CIP-003 requires the review of Policies and not plans.

Request clarity on how revisions to the plan would need to be addressed for contracts that are in the process of being negotiated since this negotiation process may take months.

SDT should clarify that existing contracts do not need to be renegotiated based on the 15 calendar month reassessment of the plan or other plan revisions.

An entity's plan must be implemented at the commencement of negotiations.

Will NERC, E-ISAC or other sources referenced in Rationale issue annual updates for supply chain risk? How will an entity prove that all risks have been incorporated? Seems to imply scope creep from elements on R1. Is *necessity* in R1 defined by entity, NERC, or outside source?

Answer	Yes
Document Name	
Comment	
R2 is pretty straightforward, however unless modified by a subsequent implementation plan, WECC would expect an entity to have a reviewed and approved SCRM plan on or before the effective date, then complete R2 on intervals of no more than 15 calendar months. If an entity exceeds the 15 calendar month time frame, an R2 PNC would be indicated.

Duke Energy suggests the drafting team consider collapsing 2.1 and 2.2 into one sub-requirement. We do not see the need in having these as two sub-requirements, and this would mirror the language used in CIP-003-6. Also, the use of the term “applicable” in R2.1, appears vague and could lead to potential disagreement on what supply chain security issues actually pose a substantial risk.

Southern Company strongly encourages the SDT to consider the below edits to R2 to make it clear that assessment of risks and revisions to the plan are required on a "once every 15 months" interval, and not at the time of each and every notification of any new potential risks/vulnerability. The below proposed modifications also clarify that *revisions* to the plan(s) are predicated on the existence of "new supply chain cyber security risks" by moving the phrase "if any." Subsequently, R2.2 has been modified to require CIP Senior Manager or delegate approval only when, following a required review every 15 months, it is determined revisions to the plan(s) are warranted to address "new supply chain cyber security risks" or "mitigation measures." As written in the draft Standard, an annual review and approval by the CIP Senior Manager or delegate where no revisions were warranted or made is a documentation exercise that provides no benefit to reliability or reduction of supply chain risk. The SDT should also consider strengthening the language in the Rationale and/or Guidelines directing Entities to adequate and/or designated sources (NERC/DHS/E-ISAC/ICS-CERT) providing Supply Chain guidance for those higher level issues that warrant a change to your plan(s). Also of note and for SDT consideration is the structure of the Implementation Plan for this Standard that does not require the CIP Senior Manager or delegate to review and approve the initial plan(s) on or before the effective date the plan(s) is required to be in place; therefore, review and approval of the plan(s) would be 15 months after the plan(s) was already in effect.

Modify R2 language as follows:

R2. Each Responsible Entity shall review its supply chain cyber security risk management plan(s) specified in Requirement R1 and update them, as necessary, at least once every 15 calendar months, which shall include:

2.1. Evaluation of revisions to address new supply chain cyber security risks and mitigation measures, if any, related to industrial control system vendor products and services applicable to the Responsible Entity's BES Cyber Cyber Systems; and **2.2.** Obtaining CIP Senior Manager or delegate approval for any revisions to the plan(s).

Generally, we agree with the requirement to have the CIP Senior Manager review and update, as necessary, its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months. However, R2.1 could be interpreted in many ways that might introduce uncertainty in the process. In agreement with EEI, we suggest the following language:	

R2. Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval for its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months.

3. The SDT developed CIP-013-1 Requirement R3 to address the Order No. 829 directive for entities to address verification of software integrity and authenticity in the BES Cyber System environment (P 48) as it applies to high and medium impact BES Cyber Systems. Do you agree with the proposed requirement? If you do not agree, or if you agree but have comments or suggestions for the proposed requirement provide your recommendation and explanation.

Summary Consideration. The SDT thanks all commenters. The SDT removed this requirement from CIP-013-1 as recommended by commenters and is addressing the directive by modifying existing CIP standards. The SDT sought input from the Project 2016-02 CIP Revisions SDT and developed Proposed CIP-010-3 Requirement R1 Part 1.6 to address the directive.

Specific comments and SDT responses are provided below:

Commenters stated that the directive should be addressed in other CIP standards. The SDT developed revisions in CIP-010-3 to specifically address directives in Order No. 829 for verifying software integrity and authenticity. The SDT used input from the Project 2016-02 CIP Revisions SDT.

Commenters stated that Responsible Entities need flexibility to account for technical feasibility or vendor capability. In developing the revisions in CIP-010-3, the SDT provided flexibility for meeting the objective *when a method to do so is provided* for the software.

Commenters recommended clarifying or changing the assets in scope for the requirement; or using a table for clarity. The revised requirement in CIP-010-3 is clearly drafted using a table format. The SDT believes the scope of High and Medium BES Cyber Systems is consistent with other configuration change management requirements, and that this will appropriately address the reliability objective for software verification as specified in Order No. 829.

Suggest “software, firmware, and associated patches” Possible TFE language for R3? The

NSRF recommends the following:

Q 3. Add language to address potential Technical Feasibility Exception (TFE).

R3. Each Responsible Entity shall implement one or more documented process(es) for verifying the integrity and authenticity of the following software and firmware**, where technically feasible,** before being placed in operation on high and medium impact BES Cyber Systems:

R3.2

“Firmware” is already included in R3 this redundant in R3.2 recommend R3 to be written as a general Requirement with specifics in the sub Requirements.

TFE opportunity is again needed, especially to address vendor-proprietary (“black box”) vendor software and firmware, nor should there be any obligation to impose measures on vendors (see our “additional comments” responses). R1.2.5 is largely duplicative of R3. They should be made consistent, or one of them should be deleted. R3 may better belong in CIP-007 and needs to be aligned with CIP-010. Requirements for a single topic should be consolidated within a single standard.

It may not be possible to verify the integrity and authenticity of software and firmware before being placed into operation if the Vendor is no longer in business or will not cooperate. There should either be an exception or '*out*' for possibility (e.g. … where possible.), leaving that determination up to an audit team, or a feasibility exception should be allowed.

Change/add language to emphasize that failure to obtain the cyber security controls from a vendor doesn't translate to being out of compliance. Entity should have the ability to mitigate risks posed by vendors. Furthermore, this risk should be evaluated during the procurement and deployment of vendor products and services (CIP-013-1 R1), and mitigated as part of the CIP-007 R2.	

IID feels that there should be an exclusion or exception (similar to a CIP Exceptional Circumstance or Technical Feasibility Exception) added to this requirement for situations where the vendor does not cooperate or is otherwise unavailable.

Duke Energy recommends the following language revision to R3.

"For BES Cyber Systems in production, each Responsible Entity shall implement one or more documented process(es) for verifying the integrity and authenticity of the following software and firmware prior to installation on high and medium impact BES Cyber Systems:"

We suggest the addition of the phrase "For BES Cyber Systems in production," at the outset of the requirement.

We also recommend replacing the phrase "placed in operation" with "prior to installation" in R3. The phrase "placed in operation" is ambiguous, and could be open to debate as to what this actually means. The language "prior to installation" is less ambiguous, the language used in FERC Order 829, and is already used in the rationale section for this requirement.

Also, Duke Energy has some concern with the amount of involvement/cooperation that will be necessary from a vendor in order to achieve compliance with this requirement. Some issues may arise if/when a vendor is not able to verify the integrity or authenticity of a certain product. We suggest the drafting team consider this situation as appropriate for a Technical Feasibility Exception or in some instances be granted a CIP Exceptional Circumstance. For example, an issue could arise wherein an entity has a device that is failing, and a fix (update of software) is needed immediately. In the interest of system stability, there may not be enough time to wait on a vendor to send a certificate of authenticity on a patch or software upgrade. We feel that a Technical Feasibility Exception and CIP Exceptional Circumstance should be considered based on these issues.

Another aspect of R3 that we think requires some clarity is whether or not R3 should apply at the BES Cyber Asset level. Currently, the language explicitly states BES Cyber System, but we feel that the language may not represent the actual intent of the requirement. If the controls proposed in R3 are better suited at the Cyber Asset level, the language should be revised to reflect this.

Lastly, Duke Energy would like to suggest that the drafting team consider that this requirement be moved to current standard CIP-007-6. CIP-007-6 already addresses security controls for BES Cyber Systems, and we feel that this control oriented requirement may be better suited there.

CIP-007 R2 requires a mitigation plan for patches that cannot be applied within 35 days. Please confirm that if a patch cannot be applied within 35 days due to the vendor's inability to provide the integrity check, there is no other compliance risk if the RE provides a mitigation plan in accordance with CIP-007 R2. Additionally, if vendors refuse or can't provide hashes or other verification methods, please provide confirmation that an internal process to test, scan and perform verification activities would be enough to satisfy this requirement.

1. R3 creates confusion and possible double jeopardy with CIP-007 R2 and CIP-010 R4 part 1.4.4. Recommend moving R3 into these Standards/Requirements. This modification to CIP-007 and CIP-010 addresses FERC order No. 829.

2. How does the SDT propose that the responsible entity handle R3 for existing equipment when the vendor is out-of-business or will not cooperate? This equipment may have been purchased prior to the implementation of CIP-013 but not put in services until after the effective date.

3. The applicability of this requirement should be limited to high and medium impact BES Cyber Systems with external routable connectivity. This would align the standard with the applicability of CIP-007 and CIP-010.

4. Suggest changing the format of the standard to use Applicability Tables like those used in CIP-004 through CIP-011.

5. Suggest changing the format of the standard to use Applicability Tables like those used in CIP-004 through CIP-011.

6. Provide clarity for when a system is pre-loaded by a vendor and delivered to an entity. Is the entity required to verify software authenticity? If a computer is purchased from Dell, can Dell provide authenticity for all of the firm ware that is part of the system but not directly manufactured by Dell; i.e. system bios, sound system, network adapter, video controller.

This requirement should be incorporated into CIP-007 R2 or CIP-010 R1. This is a System Security Management requirement and belongs in the appropriate location. CIP-013-1 R3.1-R3.4 are all components of the the CIP-010 baseline. Placing this topic in a separate standard and requirement creates compliance confusion. As entities will have to follow different requirements in CIP-007, CIP-010, and CIP-013, there is an increased likelihood of a violation.

As there is no consistency within the software industry on the use of hash functions, there must be guidelines on what is considered an acceptable approach to meet this requirement. While guidelines are needed, it must be understood that many times the individual utility has little influence on software vendors due to the relatively small purchasing power of the electric sector relative to the vendor's overall market.

- The scope of CIP-013-1 R3 overlaps with parts of CIP-007-6 R2 and CIP-010-2 R1.1-1.5. However, both CIP-007 R2 and CIP-010 R1 apply to High and Medium BCS and associated EACMS, PACs, and PCAs. The potential collision of requirements that apply inconsistently (e.g. BCS vs EACMS) across three standards will be difficult to manage, monitor, and implement. For example, timing of security patch implementation per CIP-007 R2.3 could be impeded by authenticity processes required in CIP-013. Meeting compliance with CIP-013 could unintentionally cause not only potential compliance problems with CIP-007 R2, but also significant security, operational, and/or reliability impacts.

- An exception process is required for R3. This requirement will apply to the existing complement of High and Medium BCS, upon the enforcement date of the new Standard. However, since entities are explicitly not required to renegotiate existing contracts, it may be difficult to meet compliance with this requirement upon enforcement, if existing vendors do not provide appropriate support.

- Measures and Evidence – Since the R3 requires an entity to show that documented processes have been implemented, M1 does not adequately describe the evidence required to demonstrate implementation.

1. R3 creates confusion and possible double jeopardy with CIP-007 R2 and CIP-010 R4 part 1.4.4. Recommend moving R3 into these Standards/Requirements. This modification to CIP-007 and CIP-010 addresses FERC order No. 829.

2. How does the SDT propose that the responsible entity handle R3 for existing equipment when the vendor is out-of-business, is unable to cooperate, or is unwilling to cooperate? This equipment may have been purchased prior to the implementation of CIP-013 but not put in services until after the effective date. Recommend rewording this Requirement to allow exceptions for these situations.

Does R3 allow the Entity to "accept the risk?"

We are concerned that this requirement requires vendor cooperation or else it may not be possible to verify the integrity or authenticity of software and firmware provided by the vendor. Vendors do not fall under the jurisdiction of NERC.

- Request "per system capability" wording for R3. Not all vendors provide a "golden hash" or other mechanism to validate.
- To be consistent with not requiring R1.2.5 we suggest adding the language "subject to procurement contract."

To be consistent with not requiring R1.2.5, we suggest adding the language "subject to procurement contract." There should be provisions to allow an entity to accept the risk of selecting a vendor that will not or cannot supply authentication.

Additionally, R3 may hinder an entity's ability to meet the 35-day patch window in CIP-007-6 R2.2 and R2.3. In the case of a non-cooperative vendor, entities will be left in a position of choosing to violate CIP-013, R3 or CIP-007, R2.

Is R3 the implementation of R.1.2.5? Should there be more explicit tie-ins? Seems to be in conflict with provision in R1 where "obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan"

We request clarification on relationships with resellers. Is verification of integrity and authenticity adequate from the reseller? Or does validation have to reach back to the original manufacturer?

N&ST strongly supports the goal of verifying software integrity and authenticity and hopes vendors will be generally willing to provide Responsible Entities with checksums, cyber hash values, or other integrity checks for their software and firmware. However, as written the requirement creates the potential for a conflict with CIP-007-6 R2 Part 2.3 (installation of applicable security updates), and could leave a Responsible Entity with potentially no recourse other than to create a mitigation plan if a vendor is for some reason unable or unwilling to provide such integrity verification for a patch or other type of software or firmware update. N&ST recommends that the SDT consider allowing for exceptions that must be (a) fully documented and (b) approved by the Responsible Entity's CIP Senior Manager

We agree with the drafting team that verification to the integrity and authenticity of the software needs to be validated. However, we would ask the question, "If the industry finds validations issues, how do we hold the vendor accountable?" We understand that contracts are in

place to help this situation, but this doesn't always resolve validation issues. We feel that FERC Order 829 language falls short of holding the vendors accountable in reference to addressing verification of software integrity and authenticity and as a result, the compliance burden is placed on the users. The CIP requirements focus on the Responsible Entity carrying the compliance risk even if the industry can identify vendor validation issues. For example, entities could potentially pay for product upgrades to address compliance concerns when it's been verified that the current product upgrades have not met the quality of service that was promised by the vendor. We suggest that the drafting team hold open discussions with FERC, potentially conducting a gap analysis in reference to this potential concern. If the analysis determines a gap, FERC should seek legislation to hold vendors more accountable. Also, we suggest that Requirement R3 language should be moved to the CIP-010 Standard. Our group feels that the CIP-010 Standard adequately addresses software and firmware verification. Additionally, we propose some language revisions to the Requirement language. SPP's proposed language revision to R3: "Each Responsible Entity shall implement one or more documented process for verifying the integrity and authenticity of the following software and firmware before being installed in operation on high and medium impact BES Cyber Systems". The term "installed" has been consistently used throughout the CIP-010 Standard and we feel this will give our proposed language validity and consistency.

We propose the SDT modify standard language based on Vectren's proposed language below:

R3:

Each Responsible Entity shall implement one or more documented process(es) for reviewing the vendor process for integrity and verifying authenticity of the following software and firmware, where a verification method is available from the vendor, before being placed in operation on high and medium impact BES Cyber Systems:

3.1 Operating System(s);

3.2 Firmware;

3.3 Commercially available or open-source application software; and

3.4 Patches, updates, and upgrades to 3.1 through 3.3.

Additionally, Vectren understands that due to the deadline for this standard there is not time for this now, but suggest that future revisions to the Supply Chain Risk Management standard, consider moving R3 to CIP-007 patching or possibly to CIP-010 change control to avoid "spaghetti" requirement as had existed prior to CIP V5.

Consider that future revisions format CIP-013 into a table format similar to CIP-008 & CIP-009 for clarity. Expanded comments could then be moved to Technical Guidance and Examples.

In the event the SDT does not accept the above changes, Vectren asks the following comments be considered:

R3 - Concerns that not all vendor products will provide a method to check authenticity. Concerning patching, Vectren questions the ability of the utility industry to influence the vendor's contracting language. Please consider If EACMS and PACS are truly the intent of this standard. What steps will need to be taken to verify vendor is ensuring integrity of their business partners? Consider formatting CIP-013 into a table format similar to CIP-008 & CIP-009 for clarity. Expanded comments could then be moved to Technical Guidance and Examples. Integrity is process internal to the vendor. Cannot verify integrity for each individual patch.

What does the SDT consider a "secure central software repository"?

Comment	

The draft Requirement R3 language creates compliance concerns due to the need for Responsible Entities to negotiate commercial contracts with vendors that commit the vendors to undertake the tasks necessary for R3 compliance, particularly in circumstances where only a single vendor has the capability of providing the necessary services for Cyber Assets covered by CIP-013-1. For example, unless the vendor agrees to cooperate with any software integrity and authenticity verification process, the Responsible Entity will be unable to ensure the integrity and authenticity of software used in covered Cyber Assets.

Responsible Entities could encounter scenarios where:

• Vendors may refuse to comply with the Responsible Entity's vendor controls;

• Vendors may demand an unreasonably high payment for compliance with the Responsible Entity's vendor controls;

• Vendors may agree to Responsible Entity controls but fail to take the steps necessary to implement those controls in a compliant manner; or

- Software/firmware made by a vendor no longer in business and unable to assist the Responsible Entity in the integrity and authenticity verification process.

To ensure that compliance with CIP-013-1 does not place Responsible Entities in an untenable negotiating position, a compliance "safety valve" is necessary to allow Responsible Entities to comply with the Standard even in the absence of vendor assent to the Responsible Entity's

required controls. Such a “safety valve” would be consistent with the current draft guidance on CIP-013-1 R1.2, which states that “[o]btaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity’s plan.”

Guidance language in the G&TB portion of a Standard is helpful, but the “safety valve” concept should be included within the language of the Requirement itself because only that language forms the basis of a compliance assessment.

Exelon has sent ideas under separate cover to the Drafting Team Chair outlining three options for providing the necessary “safety valve” along with proposed text edits to the requirements. In short, these options include a technical feasibility exception, a commercial feasibility exception or a simple exception documentation process.

Exelon does not support the draft language in R3 which requires an Entity to verify the integrity and authenticity before placing a BES Cyber System into operation. Instead, Exelon prefers the suggested language from Order No. 829 that directs “the integrity of the software and patches before they are installed in the BES Cyber System environment” (P. 48). Accordingly, Exelon suggests that R3 be edited to read as follows:

Each Responsible Entity shall implement one or more documented process(es) for verifying the integrity and authenticity of the following software and firmware **prior to installation into** high and medium impact BES Cyber Systems

Vectren proposes that the SDT modify standard language based on Vectren's proposed language below:

R3:

Each Responsible Entity shall implement one or more documented process(es) for reviewing the vendor process for integrity and verifying authenticity of the following software and firmware, where a verification method is available from the vendor, before being placed in operation on high and medium impact BES Cyber Systems:

3.1 Operating System(s);

3.2 Firmware;

3.3 Commercially available or open-source application software; and

3.4 Patches, updates, and upgrades to 3.1 through 3.3.

Additionally, Vectren understands that due to the deadline for this standard there is not time for this now, but suggest that for future revisions to the Supply Chain Risk Management standard, consider moving R3 to CIP-007 patching or possibly to CIP-010 change control to avoid "spaghetti" requirement as had existed prior to CIP V5.

Consider that future revisions format CIP-013 into a table format similar to CIP-008 & CIP-009 for clarity. Expanded comments could then be moved to Technical Guidance and Examples.

In the event the SDT does not accept the above changes, Vectren asks the following comments be considered:

R3 - Concerns that not all vendor products will provide a method to check authenticity. Concerning patching, Vectren questions the ability of the utility industry to influence the vendor's contracting language. Please consider If EACMS and PACS are truly the intent of this standard. What steps will need to be taken to verify vendor is ensuring integrity of their business partners? Consider formatting CIP-013 into a table format similar to CIP-008 & CIP-009 for clarity. Expanded comments could then be moved to Technical Guidance and Examples. Integrity is process internal to the vendor. Cannot verify integrity for each individual patch.

What does the SDT consider a "secure central software repository"?

Specific operational cyber security controls are best addressed as revisions to CIP-002 through -011.

Prescribing verification of integrity and authenticity is a “how” not a “what.”

Refer to EEI comments on R3. We agree with the concept of the EEI comments to consider a revision in CIP-010 for a specific security objective (“what”), such as “method(s) to minimize the risk of installing compromised” CIP-010 R1 baseline configuration items.

We recommend the CIP-013 SDT request NERC to assign the CIP revisions SDT to assist the CIP-013 team to draft the technical revisions for each of the four directives in CIP-002 through CIP-013. The CIP revisions SDT has met their Order 822 directive that had a deadline. To get the best standards for reliability and meet the FERC Order 829 directives’ deadlines, NERC and industry should reprioritize SDT teams’ work and resources.

• Patch Management obligations for cyber security related patches are already addressed in CIP-007. Dominion is of the opinion that the obligations in this requirement would be better placed (once it's determined what the obligations should be) in CIP-010 or CIP-007. • If R3 is kept in CIP-013 and not moved to an existing CIP Standard, we recommend the following: R3: Each Responsible Entity shall implement one or more documented process(es) for verifying the integrity and authenticity of the following, prior to authorized installation on high and medium impact BES Cyber Systems and associated EACMSs, PCAs, and PACs: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

Comment	

SCE&G agrees with the concerns and questions raised by the Edison Electric Institute (EEI), including the following:

"Requirement R3 and the associated guidance is not sufficient to explain the security objective this requirement is trying to address and the difference between integrity and authenticity controls. For example, the language could allow a Responsible Entity to use a vendor's website for verifying both integrity and authenticity, which will not protect against a Watering Hole attack, where the vendor's website has been compromised and both the software and the integrity check are likely to be compromised. However, we note that the majority of vendors use their websites for software downloads and include the hashes for integrity checks on those websites. Members have had difficulty in getting vendors to change their practices, which makes this requirement difficult if not impossible for Responsible Entities to comply with…Verifying integrity and authenticity may also not be possible. This requirement should be about minimizing risk and recognize that the Responsible Entity may not be able to be verify that all risk has been eliminated, especially since the risk is from a third part, a vendor."

Kara Douglas - NRG - NRG Energy, Inc. - 3,4,5,6 - FRCC,MRO,WECC,Texas RE,NPCC,SERC,SPP RE,RF	
Answer	No
Document Name	
Comment	

NRG recommends that the R3 and R4 technical/operation control requirements should be located in the associated standard to avoid misalignments or jeopardizing timeframes outline in the other standards such as patch management. For Example: R3 creates confusion and possible double jeopardy with CIP-007 R2 and CIP-010 R4 part 1.4.4.

NRG requests clarification from SDT regarding what could/should an entity do if there is no process to verify the authenticity of software? In those cases, can an entity document their defense in depth strategies as a compensating measure? NRG recommends that SDT communicate in Measures that verification of authenticity could include a way to present in our processes other methods that may not actually be verification.

NRG recommends that SDT list ways that a Registered Entity can authenticate a source in the Measures section. NRG also recommends that SDT list that a Registered Entity should have a means to use putty, Debian, or things that don't have as tight of controls, (i.e. provide a checksum, and/or set a policy that they don't use open source code and requests clarification of how a Registered Entity would demonstrate that they had verified an authoritative source (i.e. open source) to the extent of what their capability would allow). For example, NRG recommends that SDT list examples in Measures section to include use of a layered approach of security and functional testing: For example start with a notification process, authenticity check of source, and use hash / checksum, then perform testing (but how does testing demonstrate authenticity? Answer – virus scan, etc (functional vs. security testing: A/V scan, logging, access, control). Lastly perform a scan from a vulnerability assessment tool. How does this prove integrity and authenticity of the software? NRG requests clarification in the standard requirement of when this requirement would become effective. NRG recommends that the SDT allow the Registered Entities additional time for vendor re-negotiations relating to supply chain for the purposes of enabling validation of integrity and authenticity of software and firmware.

NRG suggests that the R3 language should move to CIP-010. NRG requests clarification of whether testing is a valid form of verification. Additionally, we suggest the Requirement language to read as follows "Each Responsible Entity shall implement one or more documented process(es) for verifying the integrity and authenticity of the following software and firmware before being installed in operation on high and medium impact BES Cyber Systems". Each requirement should have a provision that allows an entity to accept the risk of selection a vendor that will not or cannot supply a control.

Amelia Sawyer - CenterPoint Energy Houston Electric, LLC - 1 - Texas RE	
Answer	No
Document Name	
Comment	
R3 applies whether revised contract terms and conditions exist or not, with no exception for vendor capability issues, technical feasibility, or situations where there is no vendor. It is also not clear whether changes that are not firmware or software versions or patches fall under the requirement. CenterPoint Energy requests that the phrase “where technically feasible” be added to Requirement 3. Furthermore, the Company believes verifying software integrity and authenticity as described in CIP-013 R3 belong in CIP-010 and recommends aligning the R3 sub-requirements to match the items in CIP-010 R1.	

It is not clear what an entity must do if the vendor will not or cannot assist by providing an authentication method. Having a verification requirement for R3.4, where not automatically supported by vendors, slows down the existing patch management process. This increases security risks by leaving systems unpatched against known vulnerabilities for longer periods and increases compliance risks for entities where dated mitigation plans must be used to document delays. Additionally, it is not clear whether secure boot capability, default on many Cyber Asset operating systems, is adequate (or even required) to demonstrate compliance with software verification requirement. CenterPoint Energy recommends that R3 be revised for flexibility and feasibility. It should also be moved to CIP-010 as these requirements would seem to fit as a part of existing configuration change management processes.

CIP-013-1 Requirement R3 is written with an assumption that the supplier provides a mechanism in which verification of integrity and authenticity can be performed on software and firmware. These tools/mechanism may not always be available to the Registered Entity, and the Registered Entity may not have the power in which to force the supplier to provide a verification method. Consistent with currently approved and enforceable CIP Cyber Security Reliability Standards, ATC recommends the SDT consider adding language to provision for conditions where it is not technically possible to perform a verification in order to provide the flexibility needed to preclude an impossibility of achieving compliance. Additionally, the inclusion of "firmware" within the proposed language in CIP-013-1 R3 is an expansion in scope from the **first directive** in FERC Order No. 829 (P.2), which directed NERC to draft a new or modified Reliability Standard that "…should address the following security objectives, discussed in detail below: **(1) software integrity and authenticity;** (2) vendor remote access; (3) information system planning; and (4) vendor risk management and procurement controls."	

Additionally, CIP-013-1 Requirement R3 is simultaneously duplicative and additive with currently approved and enforceable CIP-010-2 Requirement R1 and the Applicable Systems within CIP-010-2 Requirement R1 Parts 1.1 – 1.5 as consequence of the broad reference to "high and medium impact BES Cyber Systems" without consideration of the construct of the CIP-010-2 Standard.

1. CIP-013-1 Requirement R3 Sub Requirements R3.1 – R3.4 are duplicative of CIP-010-2 Requirement R1 Parts 1.1 – 1.2, which obligates Registered Entities to develop and maintain a baseline of 'software' information for both high and medium impact BES Cyber Systems, where the types of software are effectively the same as what is being proposed.

o CIP-010-2 Requirement R1 Part 1.5 addresses the testing of changes to this 'software' and 'firmware' for high impact BES Cyber Systems, rendering Sub Requirement R3.1 – R3.4 superfluous and unnecessary. Consequently, Requirement R3.1 – R3.4 also creates a condition of potential double jeopardy for existing approved and enforceable Standard CIP-010-2 Requirement R1 Part 1.5. In its redundancy, it is at odds with the former efforts associated to the FERC filing of proposed retired standards for Project 2013-02 Paragraph 81, and the intent to eliminate duplicative or unnecessary requirements that do not provide security or reliability value.

o CIP-010-2 Requirement R1 Part 1.5 has a provision to allow for the testing of this software and firmware in production where it is not technically feasible to perform testing in a test environment. CIP-013-1 R3 is effectively an expansion in scope to CIP-010-2 Requirement R1 Part 1.5 in its obligation to perform testing "…**before being placed in operation on a high** … …**impact BES Cyber System**". Any expansion in scope to access requirements or controls for high impact BES Cyber Systems as defined in the currently approved and enforceable Standard should be subject to the Standards Authorization Request, Development, Commenting, and Balloting Processes for CIP-010-2 so as not to be effectively revising an existing approved and enforceable Reliability Standard through the creation of a separate one.

o CIP-010-2 Requirement R1 Part 1.5 is not applicable to medium impact BES Cyber Systems. CIP-013-1 R3 is effectively an expansion in scope to CIP-010-2 Requirement R1 Part 1.5 in its obligation to perform testing "…**before being placed in operation on a… …medium impact BES Cyber System**". Any expansion in scope to access requirements or controls for medium impact BES Cyber Systems as defined in the currently approved and enforceable Standard should be subject to the Standards Authorization Request, Development, Commenting, and Balloting Processes for CIP-010-2 so as not to be effectively revising an existing approved and enforceable Reliability Standard through the creation of a separate one.

Though each of the objectives in Order 829 is addressed, Reclamation recommends a more simplified format for the requirements as the SDT originally suggested in the webinar on November 10, 2016.

Reclamation recommends Requirement R3 should instead require entities to review and update as necessary their supply chain risk management plan(s) developed in Requirement R1 at least once every 15 months.

Within each Requirement, the sub-requirements should distinguish between high, medium, and low impact BES Cyber Systems and other supporting systems. Reclamation recommends the implementation plan enforcement dates be staggered based on high, medium, and low impact for auditing purposes and to allow the associated risks and severity levels to be spelled out more clearly.

Rationale for Requirement R3:

The rationale language for R3 states, “The objective of verifying software integrity and authenticity is to ensure that the software being installed in the BES Cyber System was not modified without the awareness of the software supplier and is not counterfeit.” R1, R2, and the

Rationale for Requirement R3 do not specify the impact classification (High, Medium and Low) when referencing the BES Cyber System. R3 specifically states the impact classification of the BES Cyber System “applicable to High and Medium Impact BES Cyber Systems.” IPC would like know if the inconsistent impact classification references were intended or were an oversight by the SDT.

R3

The requirement language for R3 states, “before being placed in operation on high and medium impact BES Cyber Systems.” R1, R2, and the Rationale for Requirement R3 do not specify the impact classification (High, Medium and Low) when referencing the BES Cyber System. R3 specifically states the impact classification of the BES Cyber System “applicable to High and Medium Impact BES Cyber Systems.” IPC would like know if the inconsistent impact classification references were intended or were an oversight by the SDT.

The requirement language for R3 states, “Each Responsible Entity shall implement one or more documented process(es) for verifying the integrity and authenticity of the following software and firmware." IPC is concerned that the SDT developed a standard that requires Responsible Entities to “verify the integrity and authenticity” of software and firmware of which Responsible Entities have no oversight or control over what each vendor provides.

IPC does not feel CIP-013-1 is an appropriate standard to address R3. IPC believes this requirement belongs in CIP-007-6 or CIP-010-2 as R3 is related to patching or configuration change management. IPC feels the intent of CIP-013-1 is to address supply chain controls, whereas CIP-007-6 and CIP-010-2 address testing and verification of changes controls, which are typically performed by technical staff as they test, implement, and update systems.

1) How does the SDT propose that the responsible entity handle R3 for existing equipment when the vendor is out-of-business or will not cooperate? This equipment may have been purchased prior to the implementation of CIP-013 but not put in services until after the effective date.

2) The applicability of this requirement should be limited to high and medium impact BES Cyber Systems with external routable connectivity. This would align the standard with the applicability and risk-based approach of CIP-007 and CIP-010.

3) Suggest changing the format of the standard to use Applicability Tables like those used in CIP-004 through CIP-011.

4) Provide clarity for when a system is pre-loaded by a vendor and delivered to an entity. Is the entity required to verify software authenticity? If a computer is purchased from Dell, can Dell provide authenticity for all of the firm ware that is part of the system but not directly manufactured by Dell; i.e. system bios, sound system, network adapter, video controller.

Within the Rationale, the word “ensure” is inappropriate. Even good controls do not “ensure” a desired outcome. It should also state that “software being installed in the BES Cyber System was not modified or altered without the knowledge of the supplier AND the recipient or licensee. Consider replacement of “ensure” with “confirm”.

R1. This requirement puts a substantial responsibility on the Responsible Entity without any authority or recourse if the vendor is unwilling or unable to agree. To address these concern, The IESO request that the SDT consider the use of provisional language to protect Responsible Entities such as use of a TFE.

R1. The SDT should consider the use of “validate” instead of “verify” in this requirement.

R1. The SDT should address situations that are outside the usual upgrade and patch processes. This includes the obligations for signature updates, and where a vendor brings code onsite (binary or source code) that the entity is not allowed to review.

Security Objective

Requirement R3 and the associated guidance is not sufficient to explain the security objective this requirement is trying to address and the difference between integrity and authenticity controls.

The authenticity verification is already addressed in the procurement and vendor risk assessment process. Based on the vendor provided information in 1.1.5, 1.2 should identify the method or source to obtain the software that provides reasonable assurance of the authenticity of the vendor provided software.

Methods to minimize the integrity risk is determined based on the vendor and Responsible Entity's capability and could include hash verification, vendor program review with acceptable assurance of good SDLC process and defined distribution source, through operational and security testing of software in test environment prior to installation on applicable assets, etc.

We recommend the following language for consideration by the SDT:

R3. Prior to installing new (1) operating systems(s); (2) firmware; (3) commercially available or open-source application software; and (4) patches, updates and upgrades to these, use one or more documented method(s) to minimize the risk of adversely or unintentionally modified software.

Requirement Placement (CIP-010)

Requirement R3 may also fit better within CIP-010 (e.g., after R3, Part 3.3) since it is more of an operational security control. However, the security objective for this requirement is focused on risk the vendor may introduce by delivering software that has been altered before or during transit to the Responsible Entity so keeping it in a separate, supply chain standard may also make sense. Also, to implement R3, Responsible Entities will likely need to work with the vendor during procurement (R1 and R2) to ensure that they can meet R3.

Verifying integrity and authenticity may also not be possible. This requirement should be about minimizing risk and recognize that the Responsible Entity may not be able to be verify that all risk has been eliminated, especially since the risk is from a third party, a vendor.

GTC disagrees with the proposed requirement. CIP-013-1 R3 requires actions to be taken by the Responsible Entity that are outside of the supply chain context. Paragraph 45 of Order No. 829, specifies this objective of software integrity and authenticity should be applied to "The Plan" identified in the core directive in the context of addressing supply chain management risks. The SDT has chosen to identify controls in R3 that are executed only as part of the day-to-day management of BES Cyber Systems. These controls fail to effectively address the security objective of addressing software integrity and authenticity, will have minimal security value, are administratively burdensome on industry, and are inconsistent with the supply chain context. SAFECode's (http://www.safecode.org/publication/SAFECode_Software_Integrity_Controls0610.pdf) Software Integrity Control's whitepaper outlines controls that effectively address software integrity and authenticity. Nearly all of these controls must be implemented by the vendor. As such, Responsible Entity's should have the flexibility to require the vendor to provide software assurance through contractual means. Such as "supplier provides customer ways to differentiate genuine from counterfeit software"

Unfortunately, the SDT has not provided controls that effectively address software integrity and authenticity and has instead focused its control as demonstrated by the language in the measure on ensuring the "entity performed the actions." In order to provide entities the flexibility to effectively address the security risks associated with the supply chain, we respectfully request that the SDT revise its draft standard to be more in line with the framework identified in FERC Order 829. Our recommendation, consistent with our response to question 1, is as follows

GTC recommends the SDT reconsider relocating the attributes of R3 in a manner that addresses the security objective to "The Plan" specified in R1 to align with the FERC Order. This would allow the Responsible Entity to handle contractually with the vendor i.e. "supplier provides customer ways to differentiate genuine from counterfeit software (such as digital signatures)". Our recommendation is consistent with our response to question 1, which is summarized as follows:

See GTC's comment for Question #1.

Upon close review of FERC's directives summarized beginning on paragraph 43 through paragraph 62, the Order essentially directs this new Standard as outlined:

Paragraphs 43 – 45:

R1: Develop a plan to include security controls for supply chain management that address controls for mitigating Supply Chain risks to hardware, software, and computing and networking services which are intended to support Bulk Electric System operations; that include the following four specific security objectives in the context of addressing supply chain management risks:

R1.1 Security objective 3 (*information system planning*)

R1.2 Security objective 4 (*vendor risk management and procurement controls*)

R1.3 Security objective 1 (*software integrity and authenticity*)

R1.4 Security objective 2 (*vendor remote access*)

Paragraph 43:

R2: Implement the plan specified in R1 in a forward looking manner.

Paragraphs 46 - 47:

R3: Review and update, as necessary its supply chain cyber security risk management plan(s) specified in R1 at least once every 15 calendar months

R3.1 Evaluation of revisions…

R3.2 Obtaining CIP Senior Manager or delegate approval.

Paragraphs 48 – 50:

FERC prescribes the various ways to address the first objective to the plan. Paragraphs 51 – 55: FERC prescribes the various ways to address the second objective to the plan. Paragraphs 56 – 58: FERC prescribes the various ways to address the third objective to the plan. Paragraphs 59 – 62: FERC prescribes the various ways to address the fourth objective to the plan. FERC goes on to respond to comments on Existing CIP Reliability Standards, beginning with paragraph 71, "while we recognize that existing CIP Reliability Standards include requirements that address aspects of supply chain management, we determine that existing Reliability Standards do not adequately protect against supply chain risks that are within a responsible entity's control. Specifically, we find that existing CIP Reliability Standards do not provide adequate protection for the four aspects of supply chain risk management that underlie the four objectives for a new or modified Reliability Standard discussed above." FERC summary continues to focus on CIP-013-1 being limited to aspects of supply chain risk management.

The NERC Entity is the customer of the hardware supplier and software supplier, not the designer, manufacturer and developer of what is being procured. As such, the Entity can only clearly state what they want the hardware and software to do – at a high level, likely derived from what the vendor said there product could do, along with the expectation that the product will be "bug free". But the Entity should not be expected to have the expertise and tools to "verify the integrity and authenticity of software and firmware". Integrity and authenticity can only be assured by each link backwards in the Supply Chain, and collectively that will only happen if each link of the Supply Chain agrees to control their link. CIP-013 is not in a position to impose those controls on the entire Supply Chain, but only on the end customer - NERC Registered Entity. That said, software and firmware should be expected to be checked for proper "functionality" by the Registered Entity, per past CIP practice.

This Standard, and therefore this Requirement needs to be squarely focused on the vendor product or service being procured and not on the categorization of a BES Cyber System. Requirement R3 should not be limited to High and Medium Impact BES Cyber Systems. A SEL-421 is a SEL-421 and the same risks of procurement, including firmware updates, apply to all SEL-421s impacted regardless of where they are deployed. Software/firmware updates are often acquired once and widely deployed. This is especially true in the substation environment where the exact same firmware release will be used to update Medium and Low Impact relays.

1) R3 creates confusion and possible double jeopardy with CIP-007 R2 and CIP-010 R4 part 1.4.4. Recommend moving R3 into these Standards/Requirements. This modification to CIP-007 and CIP-010 addresses FERC order No. 829.

2) How does the SDT propose that the responsible entity handle R3 for existing equipment when the vendor is out-of-business, is unable to cooperate, or is unwilling to cooperate? This equipment may have been purchased prior to the implementation of CIP-013 but not put in services until after the effective date. Recommend rewording this Requirement to allow exceptions for these situations

3) Request clarification (in the Standard) on how the SDT expects current and past contract negotiations to impact R3

Does R3 allow the Entity to "accept the risk?"

We are concerned that this requirement requires vendor cooperation or else it may not be possible to verify the integrity or authenticity of software and firmware provided by the vendor. Vendors do not fall under the jurisdiction of NERC.

· Request "per system capability" wording for R3. Not all vendors provide a "golden hash" or other mechanism to validate.

· To be consistent with not requiring R1.2.5 we suggest adding the language "subject to procurement contract."

To be consistent with not requiring R1.2.5, we suggest adding the language "subject to procurement contract." There should be provisions to allow an entity to accept the risk of selecting a vendor that will not or cannot supply authentication.

Additionally, R3 may hinder an entity's ability to meet the 35-day patch window in CIP-007-6 R2.2 and R2.3. In the case of a non-cooperative vendor, entities will be left in a position of choosing to violate CIP-013, R3 or CIP-007, R2.

Is R3 the implementation of R.1.2.5? Should there be more explicit tie-ins? Seems to be in conflict with provision in R1 where "obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan"

We request clarification on relationships with resellers. Is verification of integrity and authenticity adequate from the reseller? Or does validation have to reach back to the original manufacturer?

Comment	
For a smaller CIP applicable medium impact BES Cyber System, we apply between 5,000 and 7,000 patches a year. The only feasible means for us to apply any meaningful integrity check is through automated, cryptographic mechanisms. This is a good practice, which should be followed, but we haven't found a good adoption rate by the Vendors developing the software. Even still, authenticity controls do very little without better software development lifecycle controls in place by the vendor. Additionally, the poor record of Certificate Authorities to control certificate validation should be raised. The cost of putting a process like this in place involves a heavily centralized procurement team and the time to research a large number of vendor practices pertaining to verification. We do not believe the risk reduction justifies this very costly requirement. We propose meeting the FERC directive through R1 and dropping this Requirement altogether.

The NERC Entity is the customer of the hardware supplier and software supplier, not the designer, manufacturer and developer. As such the Entity can only clearly state what they want the hardware and software to do – at a high level, likely derived from what the vendor said it could do, plus expecting that it will be "bug free". But the Entity should not be expected to have the expertise and tools to "verify the integrity and authenticity of software and firmware" – that is required to be ensured by each step back in the Supply Chain, and that will only happen if each link of the Supply Chain agrees to control their link. CIP-013 is not in a position to impose those controls on the Supply Chain, but only on the end customer. Software and firmware should be expected to be checked for functionality by the Entity.

Comment	
SunPower believes this Requirement is already covered in CIP-007. Having a CIP-013 requirement, that if violated, opens the door to double jeopardy (a finding in CIP-013 would also lead to a finding in CIP-007). There is no need for this Requirement. If there are additional requirements that must be identified, then CIP-013 is not the place for it, CIP-007 is a more appropriate place.

Kansas City Power and Light Company incorporates by reference Edison Electric Institute's comments to Question 3. In addition, we offer the following comments:

Ambiguous Language – "integrity" and "authenticity"

The crux of the Requirement is to develop and implement plan(s) that address verification of the "integrity" and "authenticity" of operating systems, firmware, open-source software, and certain patches and upgrades prior to use. Without defining or providing a framework as to what "integrity" and "authenticity" mean, the terms are not measurable for CMEP purposes.

We suggest the Requirement include language that points to established and accepted security frameworks and standards. We offer the following alternative language:

R3. Each Responsible Entity shall manage its Cyber Asset Systems supply chain informed by well-established and accepted cyber security frameworks and standards for verifying the integrity and authenticity of the following software and firmware before being placed in operation on high and medium impact BES Cyber Systems:

R3 – line 2 – for clarity purposes NRECA recommends removing "software and firmware."	

Additionally, to the extent possible, NRECA recommends that this requirement should be incorporated into CIP-007 R2 or CIP-010 R1. This is a System Security Management requirement and belongs in the appropriate location. CIP-013-1 and R3.1-R3.4 are all components of the CIP-010 baseline. Placing this topic in a separate standard and requirement creates compliance confusion.

EPE shares the comments and concerns voiced by the Edison Electric Institute (EEI) in this Ballot #1. Please refer to the EEI ballot for detailed comments on each of the proposed requirements.

In addition, the concerns expressed by EPE in response to Requirement 1 with respect to the proposed verification requirements also applies with respect to Requirement 3. Requiring a Responsible Entity to have a process to address verification is different from making a Responsible Entity responsible for software and firmware verification. EPE has had experiences in the past where the developers/vendors of software products provided to EPE products that they considered authentic and to have integrity. EPE's testing in a strong test environment (before the products were placed in service) did not reveal any errors, yet, as the products were placed in service, errors were revealed that could not be explained *by the software developers themselves*. Under the new standard, as worded currently, would this experience create an instance of noncompliance? If so, how would a Responsible Entity avoid being noncompliant in a situation in which the product vendor created the product and still could not predict or explain the error?

As EEI explains in its comments, methods to minimize the integrity risk is determined based on the vendor and Responsible Entity's capability, and could include hash verification, vendor program review with acceptable assurance of good SDLC process and defined distribution source, through operational and security testing of software in a test environment prior to installation on applicable assets,

etc. If a Responsible Entity may satisfy its compliance responsibilities for integrity verification through such methods, the requirement should be recrafted with language that makes this clear to the Responsible Entity.

We don't believe it is reasonable to expect entities to be able to "verify" the integrity and authenticity of software and firmware in all cases. We can attempt to minimize the risk and/or provide reasonable assurance that we have received what was intended. There also needs to be a recognition of the many varied ways that updates and installations of software and firmware might be done most effectively, including the use of automated solutions.

ERCOT supports the IRC comments on this question and offers the following supplemental comments.

ERCOT recognizes the need for the concepts contained in Requirement R3. However, ERCOT disagrees with the placement of the requirement in a new standard. Since this requirement is applicable to only high and medium impact BES Cyber Systems, it should be placed within CIP-010. The requirement directly impacts the baselines that have been established within CIP-010 R1. The SDT could insert a new part between existing Parts 1.1 and 1.2 in that standard. The new part could use the following language: "For any updates or patches that that deviate from the existing baseline configuration, verify the authenticity and integrity of the update or patch." As mentioned previously, in developing the CIP Version 5 standards, the SDT performed extensive work to ensure that all requirements related to a particular subject were included in one standard instead of being spread across multiple standards. The proposed language will disrupt that framework. Including the requirement in CIP-010 will ensure that a single standard captures all parts of the change process, including inventory (Part 1.1), validation of the code (NEW), authorization of implementation (Part 1.2), update of the inventory (Part 1.3), and testing of the change (Parts 1.4 and 1.5). This approach would give Responsible Entities a complete view of what is required from the start to the end of a change. It also prevents entities from keeping separate inventories to meet the CIP-010 requirement and the CIP-013 requirement.

Additionally, ERCOT requests guidance on how to demonstrate compliance when using automated solutions to obtain the most current patches applicable to their systems. In large environments, these automated solutions are critical to meeting the timing obligations of CIP-007 R2. Inserting the manual step of verifying integrity and authenticity of updates and patches can prevent the use of these solutions that entities have invested in and rely upon for addressing security risks and regulatory obligations. If it is intended that the entity may simply document the source used by these solutions, it would be helpful to put such clarifying language in the requirement.

Additional use cases for the SDT to consider in developing guidance include: (1) how signature and pattern updates are contemplated within the requirement since these are not updates to the operating system, software, or firmware noted, (2) instances when code is packaged and mailed to an entity, (3) software and firmware that are part of a vendor black-box type of appliance solution where the entity has no visibility to the code on the device, and (4) vendors bringing code onsite that the entity is not allowed to review. Any of these cases could present an obstacle to strict compliance with the draft standard language.

As with Requirement R1, this requirement puts a substantial responsibility on the Responsible Entity without any authority or recourse if the vendor is unwilling or unable to agree. The drafting team should address situations in which vendors will not or cannot provided the levels of service mandated by this requirement. To address the concern, the drafting team should include a limited exemption from compliance, such as a Technical Feasibility Exception (TFE), which would protect Responsible Entities in the event a vendor is unwilling to agree to the terms

otherwise required by R3. NERC's Appendix 4D to the Rules of Procedure provides for a basis of approval of a TFE beyond strict technical limitations of a system. (See Section 3.0 of the appendix.)

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company	
Answer	No
Document Name	
Comment	

Southern Company disagrees with the direction the proposed R3 requirement is taking. Given our previous comments under R1 regarding the proper scoping of this new Standard to the "Supply Chain" time horizon, actions proposed to be required under R3 fall outside of that time horizon where the controls are applicable to BES Cyber Systems, which are not yet designated or commissioned as such. Additionally, R3 requires the development of "one or more documented processes" that are in addition to "the plan(s)" required in R1; Southern recommends maintaining the proper scoping of this Standard by moving the components of R3 under R1 to be addressed by the Responsible Entity in "the plan(s)."

If R3 is not consolidated under the R1 requirements for "the plan(s)" to be applicable within the Supply Chain time horizon, then Southern provides the following recommended edits to maintain vital consistency with existing requirements under CIP-010 R1.1. There is firmware in every video card, mouse, hard drive, etc. that is NOT the objective of the requirements in this Standard, but could, without the qualification provided below, be included. The addition under R3.2 also provides vital consistency with CIP-010 R1.1 so we aren't maintaining different baseline configurations on all of our systems because of slightly different wording in the two Standards.

In this situation where very similar requirements in two different standards create additional administrative burden on entities, the SDT needs to recognize and address the delays that the proposed R3 requirements will have on the existing requirements under CIP-007-6 R2 (Patch Management). The burden of verification of integrity and authenticity of software and firmware in front of applicable requirements

for determining availability, applicability, and conducting deployment of security patches within 35 day cycles will make those existing requirements under CIP-007-6 R2 unmanageable and will increase the administrative burden of creating patch mitigation plans as a result of competing Standards.

Modify R3 language as follows:

R3. Each Responsible Entity shall implement one or more documented process(es) that addresses the verification of the integrity and authenticity of the following software and firmware before being placed in operation on high and medium impact BES Cyber Systems: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

3.1 Operating System(s) or firmware where no independent operating system exists;

3.2 Commercially available or open-source application software intentionally installed; and

3.3 Patches, updates, and upgrades to 3.1 and 3.2.

We agree with this in principal, but this requirement will be extremely difficult to implement and ensure compliance. Currently, numerous vendors do not provide digitally signed patches (Microsoft is notorious for this) or other hashes to verify that a file was not modified. The ability to verify 100% of all software and files will be impossible until vendors are required to implement digital signatures. This can be done via contracts, but it will take time. We highly recommend that the requirement be changed to allow for the fact that software may not be able to be verified and that as long as an entities process checks for this that it is still valid to install with risks.

What other measures or documented evidence should be expected by the Regional Entities when evaluating R3 at audit? An entity could leverage existing CIP-010-2 R1 (3.1-3.3) baseline controls and CIP-007-6 R2 patch management (3.4) controls to support the integrity and authenticity of software and firmware as specified in the CIP-013-1 R3 requirement. However, since the baseline configurations are	

developed and managed at the BCS level, it is possible that a change to the baseline configuration(s) of a vendor supplied system may not trigger a change to the corresponding baseline configuration for the BCS to which the system(s) is assigned. Therefore, relying on changes to the baseline configuration(s) may not (by itself) be a reliable control to determine if changes were made to a new vendor-supplied system. In such cases, the addition of a simple control (an extra check for new vendor-supplied systems) integrated into an entity's existing CIP-010-2 program would suffice to address the issue.

Stephanie Little - APS - Arizona Public Service Co. - 5	
Answer	Yes
Document Name	
Comment	
AZPS notes that Requirement R3 requires documented processes for verifying the "integrity and authenticity" of software and firmware before being place into operation and that such language may result in redundant verifications and processes. In particular, software, firmware, etc. are often verified when they are received from the vendor and "incubated" on low risk systems before being pushed to BES Cyber Systems. To avoid the need to "re-verify" these updates after incubation, but prior to placement in production on BES Cyber Systems, AZPS requests the following change to Requirement R3, '…verifying the integrity and authenticity of the following software and firmware ***being placed in operation on high and medium impact BES Cyber Systems***, **when received**'. Additionally, Requirement R3 addresses the verification of integrity and authenticity of software and firmware; however, it does not address the likelihood of a vendor's inability or unwillingness to comply. AZPS requests clarification of whether an inability to verify would be considered a failure to implement the process if verification is not possible due to vendor inability or unwillingness.

Sheranee Nedd - Public Service Enterprise Group, Public Service Electric & Gas, PSEG Fossil LLC, PSEG Energy Resources & Trade LLC - 1,3,5,6 - NPCC,RF, Group Name PSEG REs	
Answer	Yes
Document Name	
Comment	
PSEG agrees with the intent of this requirement, but has the following questions/recommendations below: • The way this requirement is written, it may not be possible to perform a technical verification of software integrity and authenticity. How does the standard drafting team expect registered entities to address this if it cannot be done in a technical manner? • Requirements R1 and R2 do not require the registered entity to go back and revise previous contracts. In order to comply with this requirement, R3, changes to past contracts / vendor service agreements may be required. Alignment is needed between R1, R2, and R3.

Suggest striking the word “associated” from the phrase “software, firmware, and associated patches”.	

Basin Electric recommends adding language to address potential Technical Feasibility Exception (TFE) such as: R3. Each Responsible Entity shall implement one or more documented process(es) for verifying the integrity and authenticity of the following software and firmware**, where technically feasible,** before being placed in operation on high and medium impact BES Cyber Systems: In R3.2, "Firmware" is already included in R3 which is redundant in R3.2. Basin Electric recommends R3 be written as a general Requirement with specifics in the sub Requirements. There are a lot of parallels between these requirements and the requirements already required in CIP-007 R2 patch management controls. Basin Electric would rather see these obligations integrated into CIP-007. The rationale explains the obligation for this requirement starts in the operate/maintain phase of the life cycle, but the timing/life cycle language is not included in requirement. Basin Electric suggests modifying the requirement to include clarification of when the obligation starts. Perhaps add language to the front of R3 such as: "For Cyber Assets in production…"

4. The SDT developed CIP-013-1 Requirement R4 to address the Order No. 829 directive for entities to address logging and controlling third-party (i.e., vendor) initiated remote access sessions including machine-to-machine vendor remote access to BES Cyber Systems (P 51) as it applies to high and medium impact BES Cyber Systems. Do you agree with the proposed requirement? If you do not agree, or if you agree but have comments or suggestions for the proposed requirement provide your recommendation and explanation.

Summary Consideration. The SDT thanks all commenters. The SDT removed this requirement from CIP-013-1 as recommended by commenters and is addressing the directive by modifying existing CIP standards. The SDT sought input from the Project 2016-02 CIP Revisions SDT and developed Proposed CIP-005-6 Requirement R2 Parts 2.4 and 2.5 to address the directive. The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. The obligation in Part 2.4 requires entities to have a method to determine active vendor remote access sessions. While not required, a solution that identifies all active remote access sessions, regardless of whether they originate from a vendor, would meet the intent of this requirement as the objective of Part 2.4. The objective of Requirement R2 Part 2.5 is for entities to have the ability to rapidly disable active remote access sessions in the event of a system breach as specified in Order No. 829 (P. 52).

Specific comments and SDT responses are provided below:

Commenters stated that the directive should be addressed in other CIP standards. The SDT developed revisions in CIP-005-6 to address risks and reliability objectives from Order No. 829 dealing with vendor remote access. The SDT based revisions on input from the Project 2016-02 CIP Revisions SDT.

Commenters stated that Responsible Entities need flexibility to account for technical feasibility or vendor capability. The new requirements in CIP-005-6 require entities to have one or more methods for determining active vendor remote access sessions, and one or more methods for disabling active vendor remote access. The SDT believes Responsible Entities can meet these objectives and will not need exceptions based on vendor capability.

Commenters recommended clarifying or changing the assets in scope for the requirement; or using a table for clarity. The revised requirement in CIP-005-6 is clearly drafted using a table format. The SDT believes the scope of High and Medium BES Cyber Systems and associated PCAs is consistent with other remote access requirements, and that this will appropriately address the reliability objective for vendor remote access as specified in Order No. 829.

As written, R4 is more appropriately addressed in other existing standards, CIP-004 for authorization, CIP-005 for remote access, CIP-007 for logging, and CIP-008 for response. Furthermore, it confuses the expectation of all these standards from an audit perspective by duplicating or undermining existing requirements. Authorization for interactive remote access is already covered in CIP-004 R4. Logging and monitoring of access to an Intermediate System or BES Cyber Asset is already covered in CIP-007 R4. If an entity requires separate evidence for those standards and CIP-013 R4, this could present a double jeopardy situation for compliance where an entity can be audited and penalized twice for similar requirements if a Regional Entity does not find their methods of compliance satisfactory.

Controlling remote access, including vendor remote access, is already addressed in CIP-005 R1 and R2 so CIP-013 R4 will overlap with those existing requirements. CenterPoint Energy recommends changing “system-to-system remote access with a vendor” to “vendor initiated system-to-system remote access” and modifying existing requirements if necessary, rather than including the requirements in CIP-013.

R4.3 is part of an entity's incident response plan, and should be in CIP-008. R4.2, R4.3 sub-requirements both need clauses for per Cyber Asset capability or technical feasibility exceptions.

Comment	

1) R4 creates confusion and possible double jeopardy with other standards. Recommend moving R4 into the following Standards/Requirements CIP-005 R2, CIP-007 R4 Subpart 4.1.5 and/or CIP-008 R1 part 1.6 to address FERC order No. 829.

2) Recommend that this Rationale needs to be updated from "machine-to-machine" to "system-to-system" for consistency

3) The first sentence of R2 is broader than the second sentence. The first sentence is "Each Responsible Entity shall implement one or more documented process(es) for controlling vendor remote access to high and medium impact BES Cyber Systems." The second sentence is "The process(es) shall provide the following for (i) vendor-initiated Interactive Remote Access and (ii) system-to-system remote access with a vendor(s):" Recommend that the first sentence needs to be consistent with the Order and reference *vendor-initiated* remote access and not *vendor* remote access.

4) Request guidance. "Vendor-Initiated" could be considered a single word and not associated with the proposed definition of "vendor".

5) Recommend changing R4.3, from "Disabling or otherwise responding to unauthorized activity during remote access sessions" to "Disabling or otherwise responding to *detected* unauthorized activity."

6) The phrase “during remote access” does not seem to align with the “timely manners” guidance given on page 15, line 23 of the Guidance and Examples document. This capability to disable during the remote access session may not always be possible and would be dependent on how the unauthorized activity was detected.

We propose the SDT modify standard language based on Vectren's proposed language below:	

R4.

Each Responsible Entity shall implement one or more documented process(es) for controlling vendor remote access to high and medium impact BES Cyber Systems. The process(es) shall provide the following for (i) vendor-initiated Interactive Remote Access and (ii) machine-to-machine remote access with a vendor(s):

4.1 Authorization of remote access by the Responsible Entity;

4.2 Log and review vendor remote access;

4.3 Disabling or otherwise responding to unauthorized access during remote access sessions.

Consider removing R4 and refer to CIP-005 R2 regarding Interactive Remote Access. If this is not an option, Vectren offers the following suggestions:

Consider defining system-to-system access (is this aka machine-to-machine)? See page 13 of Technical Guidance and Examples, paragraph #9.

Consider direct application access servers, such as those that deliver anti-virus signature updates, are not considered in scope.

Consider defining “unauthorized activity” if that is not changed to “unauthorized access”.

For future consideration, format CIP-013 into a table format similar to CIP-008 & CIP-009 for clarity. Expanded comments could then be moved to Technical Guidance and Examples.

In the event the SDT does not accept the above changes, Vectren asks the following comments be considered:

R4

This requirement is too broad to implement or audit and, therefore, outweighs the purpose of the regulatory efforts. Same question as in R1.2.6 concerning anti-virus signature updates. Unauthorized activity is not defined. This is open to interpretation such as to include a user opening files they should not be viewing, or looking at settings that are not related to the task at hand. This could also be interpreted that we

must monitor every move, such as monitoring only through a WebEx while the vendor is accessing the system. Auditor could interpret this in many ways.

Same as RoLynda Shumpert's comments from SCE&G: *SCE&G agrees with EEI in its assessment regarding R4:* *"The use of "activity" in 4.2 and 4.3 is a concern because it may be difficult for a Responsible Entity to determine whether the activity is authorized or unauthorized. Also, there is no such thing as "escorted cyber access." In almost all cases, the reason the Responsible Entity is allowing the remote vendor to support the system is that they have knowledge and skills that the Responsible Entity does not. Therefore the Responsible Entity would not be able to recognize inappropriate actions… We recommend that the SDT consider changing "activity" to "access" in parts 4.2 and 4.3."*

1. R4 creates confusion and possible double jeopardy with other standards. Recommend moving R4 into the following Standards/Requirements CIP-005 R2, CIP-007 R4 Subpart 4.1.5 and/or CIP-008 R1 part 1.6 to address FERC order No. 829.

2. Recommend that this Rationale needs to be updated from “machine-to-machine” to “system-to-system” for consistency

3. The first sentence of R2 is broader than the second sentence. The first sentence is “Each Responsible Entity shall implement one or more documented process(es) for controlling vendor remote access to high and medium impact BES Cyber Systems.” The second sentence is “The process(es) shall provide the following for (i) vendor-initiated Interactive Remote Access and (ii) system-to-system remote access with a vendor(s):“ Recommend that the first sentence needs to be consistent with the Order and reference *vendor-initiated* remote access and not *vendor* remote access.

4. Request guidance. “Vendor-Initiated” could be considered a single word and not associated with the proposed definition of “vendor”.

5. Recommend changing R4.3, from “Disabling or otherwise responding to unauthorized activity during remote access sessions“ to “Disabling or otherwise responding to *detected* unauthorized activity.“

6. The phrase “during remote access” does not seem to align with the “timely manners” guidance given on page 15, line 23 of the Guidance and Examples document. This capability to disable during the remote access session may not always be possible and would be dependent on how the unauthorized activity was detected.

7. Consider eliminating sub requirements 4.1 and 4.2 since they are covered in CIP-005 and CIP-007, R5 respectively. Consider addressing sub requirement 4.3 by modifying CIP-005 thus eliminating R4 from the proposed CIP-013 standard.

8. R4 should be moved to CIP-005 since this requirement, as written in CIP-013, only applies to vendors having remote access. This does not address other sources of remote access threats as written.

9. For R4.2, we suggest limiting the retention period for evidence logs to 90 days to be consistent with CIP-007 R4, Parts 4.1, 4.2, and 4.3. 10. This would increase the scope of file integrity monitoring to Medium impact devices, some which are not capable of logging. This would discourage entities from allowing vendors to ever log in remotely, which might hinder reliability in the case of required emergency troubleshooting/support. Lack of timely support would also force entities to be non-compliant with other standards, such as other CIPs. 11. Remove vendor remote access from scope and only include system-to-system. Vendor remote access is already addressed in CIP-005 R2. 12. SDT appears to be building on top of CIP-005 R1.5; however, R4.3 says "during the remote access session," which may not reasonable amount of time since this is a real-time action.

Kara Douglas - NRG - NRG Energy, Inc. - 3,4,5,6 - FRCC,MRO,WECC,Texas RE,NPCC,SERC,SPP RE,RF	
Answer	No
Document Name	
Comment	
NRG suggests that R4, Section 4.1, Section 4.2, Section 4.3 language be moved to CIP-005. Since this is interactive remote session specific, NRG recommends moving all of these requirements into CIP-005 because of the implied real-time monitoring and logging requirements. Even though there are monitoring requirements in CIP-007, the monitoring requirements of CIP-007 are more forensic in nature. Various vendors and entities will likely want to implement individualized solutions to manage this requirement which will become administratively burdensome to the industry. These varied solutions can also present more ports being open (a reliability /security risk) to High and Medium	

BES Cyber Systems which could lessen reliability. NRG recommends that scope of this requirement should be for High and Medium with ERC BCS.

NRG requests that the SDT provide clarity that "system-to-system" is equivalent to "machine-machine" and what does it mean (i.e. application interface vs. laptop/server level). NRG recommends reference to the OSI layers. The R4 rationale appears to be inconsistent with the FERC directive regarding "machine to machine". NRG requests clarification of whether the rationale / intent of "system-to-system" is meaning that a direct machine to machine interface is needed or that it needs to go through an intermediate or third host (jump host). NRG requests that the term "vendor" be defined to clarify intent of meaning a company or an individual (in the context of interactive remote access).

In the implementation plan for this standard, NRG recommends a staggered implementation plan for R1, R2 & , R5 being 15 calendar months. However, NRG recommends a 24-month implementation plan for R3 & R4would be needed for Registered Entities to manage this process on all impacted systems due to the need to re-negotiate processes with vendors (individualized solutions).

- Interactive Remote Access controls are defined in CIP-005 and in CIP-007. These requirements are duplicative and create the possibility of double-jeopardy for non-compliance. In addition, CIP-004-6 R4 Part 4.1.1 specifically addresses electronic access. Dominion is of the opinion that CIP-013-1 should concentrate on supply chain obligations for system-to-system communications which isn't addressed under the existing CIP standards. Operational requirements, such as the proposed R3, should be added to the appropriate CIP standard.
- Dominion recommends removal of Part 4.2. Complying with the logging requirement could degrade system performance to the point where the BES reliability would be negatively impacted. Additionally, the monitoring requirement further degrades the performance, and may not be technically feasible.
- If Part 4.2 is retained, the requirements should state the minimum criteria for logging and monitoring unauthorized access, as currently outlined in CIP-007-6 Part 4.1.
- The terms "access" and "activity" as used in the proposed CIP-013-1 need to be defined.
- Read only access should be excluded from the final requirement based on definition of Interactive Remote Access.

- Dominion recommends the removal of Part 4.3 Disabling or otherwise responding to unauthorized activity during remote access sessions seems to imply an on-going monitoring of active connections to a degree that's not technically feasible.
- If Part 4.3 is retained, we recommend that the minimum criteria for logging and monitoring be limited to disabling what has been detected. Dominion recommend the following language to achieve this goal:

4.3: Disabling or otherwise responding to detected, logged, and monitored unauthorized activity during remote access sessions.

- Dominion recommends creating a definition "system-to-system remote access" in the NERC glossary. Using a broad undefined term can lead to inconsistent results.

We propose the SDT modify standard language based on Vectren's proposed language below:

R4.

Each Responsible Entity shall implement one or more documented process(es) for controlling vendor remote access to high and medium impact BES Cyber Systems. The process(es) shall provide the following for (i) vendor-initiated Interactive Remote Access and (ii) machine-to-machine remote access with a vendor(s):

4.1 Authorization of remote access by the Responsible Entity;

4.2 Log and review vendor remote access;

4.3 Disabling or otherwise responding to unauthorized access during remote access sessions.

Consider removing R4 and refer to CIP-005 R2 regarding Interactive Remote Access. If this is not an option, Vectren offers the following suggestions:

Consider defining system-to-system access (is this aka machine-to-machine)? See page 13 of Technical Guidance and Examples, paragraph #9.

Consider direct application access servers, such as those that deliver anti-virus signature updates, are not considered in scope.

Consider defining "unauthorized activity" if that is not changed to "unauthorized access".

For future consideration, format CIP-013 into a table format similar to CIP-008 & CIP-009 for clarity. Expanded comments could then be moved to Technical Guidance and Examples.

In the event the SDT does not accept the above changes, Vectren asks the following comments be considered:

R4

This requirement is too broad to implement or audit and, therefore, outweighs the purpose of the regulatory efforts. Same question as in R1.2.6 concerning anti-virus signature updates. Unauthorized activity is not defined. This is open to interpretation such as to include a user opening files they should not be viewing, or looking at settings that are not related to the task at hand. This could also be interpreted that we must monitor every move, such as monitoring only through a WebEx while the vendor is accessing the system. Auditor could interpret this in many ways.

Specific operational cyber security controls are best addressed as revisions to CIP-002 through -011.

Refer to EEI comments on R4 which point out overlaps to existing requirements in CIP-004, -005 and -008.

We recommend the CIP-013 SDT request NERC to assign the CIP revisions SDT to assist the CIP-013 team to draft the technical revisions for each of the four directives in CIP-002 through CIP-013. The CIP revisions SDT has met their Order 822 directive that had a deadline. To get the best standards for reliability and meet the FERC Order 829 directives' deadlines, NERC and industry should reprioritize SDT teams' work and resources.

We further point out the FERC Order 829 has directed revisions to remote access (for vendors) by Sept. 2017 which is before FERC's Order 822 P64 directive to NERC for a CIP version 5 remote access controls effectiveness study is even due. The remote access controls effectiveness study is not due till June 30, 2017.

Comment	

The proposed Requirement creates significant overlap with existing CIP Requirements. Requirement R4, as well as Requirements R3 and R5, should be modified so that CIP-013 only addresses those aspects of software integrity and authenticity (R3), remote access (R4), and authenticity and remote access for low impact BES Cyber Systems (R5) not covered by other Standards. Exelon understands that the timeframe dictated by FERC in Order No. 829 does not allow for revisions by this SDT to the relevant Standards that address these topics. However, overlap between the Standards should be avoided as much as possible to avoid double jeopardy concerns in the event of potential non-compliance with CIP-013 R3, R4, and R5.

For example, Exelon's review of the draft CIP-013-1 Standard indicates the following areas of overlap:

• CIP-013-1 R3.1 through R3.4 require authentication of operating systems, firmware, software, and patches. However, the configuration change management requirements under CIP-010-2 R1 already require that the configuration of operating systems, firmware, and software be carefully tracked such that counterfeit operating systems, firmware, software, and patches would be identified (e.g. a software difference would be identified as a change from the existing baseline configuration) and would be evaluated.

• CIP-013-1 R3.4 requires authentication of patches, updates, and upgrades, but CIP-007-6 R2.1 already imposes a patch management process for tracking, evaluating, and installing cyber security patches, including the identification of patching sources. Part of the

identification of patching sources under CIP-007-6 is the verification that those sources are authentic as CIP-013-1 R3.4 would appear to require.

• CIP-013-1 R4.1 requires authorization of remote access to certain BES Cyber Systems by the vendor. CIP-004-5 R4.1.1 already contains a process for authorizing electronic access to these assets by all personnel, including vendors.

• CIP-013-1 R4.2 requires logging and monitoring or remote access sessions. CIP-007-6 R4.1 already requires logging of all access and CIP-007-6 R4.2 requires alerting for any malicious code as well as any “security ecent that the Responsible Entity determines necessitates an alert.”

• CIP-013-1 R4.3 also requires responding to detected unauthorized activity, and because unauthorized activity on a BES Cyber System would constitute a “Cyber Security Incident,” CIP-008-5 already requires a response to such incidents.

• CIP-013-1 R5 requires a process for controlling vendor remote access to low impact BES Cyber Systems. This overlaps with CIP-003-6 Attachment 1 Section 3 which already requires electronic access controls for low impact BES Cyber Systems the limit access to necessary access.

The draft CIP-013-1 requirements should be modified so that overlaps are removed and that CIP-013-1 only addresses vendor issues not covered within existing Standards. To the extent the SDT believes there is no overlap between CIP-013 and the existing CIP Standards, the SDT should explain in each instance where the CIP-013 Requirement ends and the other CIP Requirement begins. In the absence of such guidance, a Compliance Monitoring and Enforcement Process could conclude that a particular instance of non-compliance with CIP-013 is also a simultaneous violation of another Reliability Standard, doubling the available penalty range. For example, draft CIP-013-1 R4 requires the Responsible Entity to authorize remote access by vendor personnel. The current CIP-004-6 R4.1.1 also requires authorization of vendor personnel to have electronic access. Therefore noncompliance with CIP-013-1 R4 would appear to, per se, constitute noncompliance with CIP-004-6 R4.1.1. Such double jeopardy serves no apparent reliability purpose. If the current CIP-013-1 R4 language is adopted as-is, the SDT should explain how its requirements differ from those under CIP-004-6 R4.1.1.

Finally, Exelon suggests that R4.3 may be difficult to accomplish in all cases and is overly prescriptive and thus should be removed from CIP-013. Order No. 829, P.52 references the Ukraine event and the threat that “vendor credentials could be stolen and used to access a BES Cyber System without the responsible entity’s knowledge, as well as the threat that a compromise at a trusted vendor could traverse over an unmonitored connection into a responsible entity’s BES Cyber System.” There are alternate methods to address this threat. First, two factor identification methods can be used to mitigate the risk of stolen credentials. Second, the use of WebEx or Skype sessions or active control of

vendor access (i.e. opening a port for access only when needed) can be used to address emergent issues and reduce the need for remote persistent sessions.

Answer	No
Document Name	
Comment	

We suggest that Requirement R4 Section 4.1 language be moved to the CIP-004 Standard. The group feels that CIP-004 Part 4.1 already handles access controls in that particular Cyber Standard. Additionally, we feel that a potential conflict may exist between CIP-013 Requirement R4 and CIP-004 Requirement R4 if this Requirement stays in its current position.

As for Section 4.2 language being moved to the CIP-007 Standard, our group feels that the CIP-007 Standard already addresses logging.

Finally, we suggest moving Section 4.3 Language to the CIP-005 Standard because, we feel that the CIP-005 Standard already addresses interactive access to BES Cyber Systems.

R4 creates confusion and possible double jeopardy with other standards. Recommend moving R4 into the following Standards/Requirements CIP-005 R2, CIP-007 R4 Subpart 4.1.5 and/or CIP-008 R1 part 1.6 to address FERC order No. 829. The phrase “during remote access” does not seem to align with the “timely manners” guidance given on page 15, line 23 of the Guidance and Examples document. This capability to disable during the remote access session may not always be possible and would be dependent on how the unauthorized activity was detected. Consider eliminating sub requirements 4.1 and 4.2 since they are covered in CIP-005 and CIP-007, R5 respectively. Consider addressing sub requirement 4.3 by modifying CIP-005 thus eliminating R4 from the proposed CIP-013 standard. R4 should be moved to CIP-005 since this requirement, as written in CIP-013, only applies to vendors having remote access. This does not address other sources of remote access threats as written. After moving to CIP-005, R4.2 should be revised to say: “Capability to detect unauthorized activity; and” R4.3 should add the word “detected” before the term “unauthorized activity.” For R4.2, we suggest limiting the retention period for evidence logs to 90 days to be consistent with CIP-007 R4, Parts 4.1, 4.2, and 4.3. This would increase the scope of file integrity monitoring to Medium impact devices, some which are not capable of logging. This would discourage entities from allowing vendors to ever log in remotely, which might hinder reliability in the case of required emergency troubleshooting/support. Lack of timely support would also force entities to be non-compliant with other standards, such as other CIPs. Remove vendor remote access from scope and only include system-to-system. Vendor remote access is already addressed in CIP-005 R2. Suggest that this Rationale needs to be updated from “machine-to-machine” to “system-to-system.” SDT appears to be building on top of CIP-005 R1.5; however, R4.3 says “during the remote access session,” which may not reasonable amount of time since this is a real-time action.

Mike Kraft - Basin Electric Power Cooperative - 5	
Answer	No
Document Name	
Comment	

R4 appears to be in parallel to requirements that already exist in CIP-004, CIP-005, CIP-007 and CIP-008. Basin Electric would prefer the requirements be integrated with the existing standards.

Basin Electric believes the following items will cause double jeopardy if there is a non-compliance action with the proposed R4:

R4, Part 4.1 is duplicative with CIP-004-6 R4, Part 4.1

R4, Part 4.2 is duplicative with CIP-007-6 R4, Part 4.1

R4, Part 4.3 should be taken care of by complying with CIP-005-5 Part 1.3 which requires inbound and outbound access permissions which prevent unauthorized activity.

R4, Part 4.3 “otherwise responding” should be taken care of by complying with CIP-008-5 R2.

In the context of R1–R3, the term “vendor” appears to apply to a company as stated in the rationale section. In context of R4, the same term “vendor” now appears to mean individual personnel who represent a company. Clarity is needed on who this requirement actually applies to.

- The scope of CIP-013-1 R4 appears to overlap with parts of CIP-005-5R1.3, R1.5, R2.1 - 2.3; and CIP-007 R4.1, R4.2, R5.7. (Both of the CIP-007 and CIP-005 requirements apply to High and Medium BCS and associated EACMS, PACs, and PCAs). However, the logging and monitoring requirements in CIP-007-6 R4.1, 4.2 specifically cite "per Cyber Asset capability" and "after-the-fact investigations."

o Additionally, the CIP-013 requirement indicates "Disabling or otherwise responding to unauthorized activity during remote access sessions." Not all technologies would have the capability of real-time cyber asset level user activity monitoring, needed to detect activity and disable sessions.

o CIP-013 R4 does not consider the variability of cyber asset capability. Not all technologies can support cyber asset level logging.

- A definition of "unauthorized activity" is needed. Note: existing processes in CIP-004 establish authorized activity for vendors, contractors, and employees, including: training, PRA, and access management. Security controls in CIP-005 and CIP-007 enforce the limits of those authorizations. Vendors who are granted specific access rights to remotely access systems are, by definition, authorized to perform certain functions. Jump-hosts, firewalls, user accounts, and application privileges already limit activity to permitted activity.

- "Machine-to-machine vendor remote access" should be defined, or the formal definition of "Interactive Remote Access" should be modified to include machine access.

- "Monitoring" should be defined. Suggested clarification is that monitoring includes information regarding the startup and termination of the connection, but does not include the capturing of user activity during the session.

SRP requests that the scope of R4 be limited to high and medium BES Cyber Systems with ERC or Dial-up Connectivity as these systems have the highest risk associated with remote access.

Elements of R4 (authorization, logging/monitoring) appear duplicative of existing CIP requirements. SRP requests that the scope of R4 be limited to disabling remote access.

For R4.3, the phrase "during remote access" does not seem to align with the "timely manners" guidance given on page 15, line 23 of the Technical Guidance and Examples document. The capability to disable during the remote access session may not always be possible and would be dependent on how the unauthorized activity was detected. SRP requests changing the language to "upon detected unauthorized activity".

CIP-013 R4.1 is duplicative of CIP-004 R4.3 as all persons already require authorization of electronic access to the systems in scope of this requirement. As entities will have to follow duplicate requirements in two different standards, CIP-004 and CIP-013, there is an increased likelihood of a violation. CIP-013 R4.2, Logging, monitoring, and alerting is already covered in CIP-007 R4.1 and R4.2. An additional requirement part in CIP-007 R4 would be the most effective place to meet this FERC expectation. As entities will have to follow duplicate requirements in two different standards, CIP-007 and CIP-013, there is an increased likelihood of a violation. CIP-013 R4.3 would be handled best as a component of CIP-007 R4 for detected inappropriate access. Alerting is already required by CIP-007 R4.2 and a simple additional step (requirement part) would require a response to the alert. The guidelines and technical basis should discuss use of intrusion prevention systems to meet this requirement without requiring significant additional compliance evidence.

CHPD requests that the scope of R4 be limited to high and medium BES Cyber Systems with ERC or Dial-up Connectivity as these systems have the highest risk associated with remote access. Elements of R4 (authorization, logging/monitoring) appear duplicative of existing CIP requirements. CHPD requests that the scope of R4 be limited to disabling remote access. For R4.3, the phrase "during remote access" does not seem to align with the "timely manners" guidance given on page 15, line 23 of the Technical Guidance and Examples document. The capability to disable during the remote access session may not always be possible and would be dependent on how the unauthorized activity was detected. CHPD requests changing the language to "upon detected unauthorized activity".

R4 creates confusion and possible double jeopardy with other standards. Recommend modifying modify CIP-005 R2 , CIP-007 R4 Subpart 4.1.5 and/or CIP-008 R1 part 1.6 address the FERC order No. 829.

Recommend that this Rationale needs to be updated from "machine-to-machine" to "system-to-system" for consistency

The first sentence of R2 is broader than the second sentence. The first sentence is "Each Responsible Entity shall implement one or more documented process(es) for controlling vendor remote access to high and medium impact BES Cyber Systems." The second sentence is "The process(es) shall provide the following for (i) vendor-initiated Interactive Remote Access and (ii) system-to-system remote access with a

vendor(s):“ Recommend that the first sentence needs to be consistent with the Order and reference *vendor-initiated* remote access and not *vendor* remote access.

Request guidance. “Vendor-Initiated” could be considered a single word and not associated with the proposed definition of “vendor”.

Recommend changing R4.3, from “Disabling or otherwise responding to unauthorized activity during remote access sessions“ to “Disabling or otherwise responding to detected unauthorized activity.“

For R4.3, the “during remote access” does not seem to align with the “timely manners” guidance given on page 15, line 23 of the Guidance and Examples document. This capability to disable during the remote access session may not always be possible and would be dependent on how the unauthorized activity was detected. Suggest changing to “detected unauthorized activity”.

Suggest changing the format of the standard to use Applicability Tables like those used in CIP-004 through CIP-011.

AECI supports the following comments from the MRO NSRF: “The NSRF believes the following items will cause double jeopardy if there is a non-compliance action with the proposed R4: R4, Part 4.1 is duplicative with CIP-004-6 R4, Part 4.1 R4, Part 4.2 is duplicative with CIP-007-6 R4, Part 4.1 R4, P4.3 should be taken care of by complying with CIP-005-5. Part 1.3 of CIP-005-5 requires inbound and outbound access permissions which prevent unauthorized activity.” Furthermore, AECI contends that the SDT should remove this requirement and address vendor remote access in the implementation of the supply chain risk management plan(s) as detailed in the requirement concepts proposed by AECI in Question 1. This concept will allow Responsible Entities to address the issue contractually with applicable vendors.

We request confirmation that vendor access does not include onsite staff augmentation contract resources. Clarification is also requested on whether "system to system" access applies to access that is "one-way" where the remote end conducts only monitoring activity and no control is possible. Can the procedure for access make distinctions for each method of monitoring each type of access, Interactive Remote, system to system with control and system to system for monitoring only? Finally, the term "unauthorized activity" is unclear. We recommend using the term "unauthorized access".

The rationale section in Requirement R4 speaks to "machine-to-machine vendor remote access" while the actual requirement speaks to "system-to-system remote access with a vendor". ReliabilityFirst recommends the SDT use consistent language so that there is no confusion on terminology or definitions. Requirement R4 mentions high and medium BES Cyber Systems, but does not include their associated Electronic Access Control and Monitoring Systems (EACMs), Physical Access Controls(PACS), and Protected Cyber Assets (PCAs). ReliabilityFirst offers the following modifications for consideration:	

Each Responsible Entity shall implement one or more documented process(es) for controlling vendor remote access to high and medium impact BES Cyber Systems [and if applicable, associated Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets]. The process(es) shall provide the following for (i) vendor-initiated Interactive Remote Access and (ii) system-to-system remote access with a vendor(s): *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

Duke Energy recommends that the drafting team consider creating a definition for the terms “vendor” and “unauthorized activity”. Without clear expectations as to what is considered unauthorized activity, and further technical guidance on how to detect this type of activity, the Responsible Entity will not be able to determine what to look for to comply with R4.2, and will not know when to disable this activity to comply with R4.3. We request further clarification from the drafting team on what is meant by “*vendor-initiated Interactive Remote Access”.* Does this refer to access that originates from a non-Responsible Entity system? Also, does “*remote access*” apply in the instance where a non-Responsible Entity party accesses a BES Cyber System remotely to the ESP, but is originating on a network inside of the Responsible Entity’s infrastructure? Should the requirement language be revised to better categorize remote access as “external” remote access originating from a location that is not a Responsible Entity’s facility or location?

This risk should be evaluated during the procurement and deployment of vendor products and services (CIP-013-1 R1), and mitigated as part of the CIP-005 R2, CIP-004 R4, and CIP-007 R4. IID feels that there should be an exclusion comparable to a CIP Exceptional Circumstance (or Technical Feasibility Exception) added to this requirement for situations where the vendor does not cooperate or is otherwise unavailable.

This seems not to be a supply-chain issue. It would seem that NERC's intent is to wrap-up order 829 into a single standard instead of modifying the existing standards (CIP-005 Requirement 2), where necessary, to address these weaknesses.

There should *most definitely* be a feasibility exception with respect to 4.2 and 4.3.

What does 'during remote access sessions' mean in 4.3? If the session is active, it would be prudent to expect immediate termination of the connection as the Guidance suggests – responding in a timely manner. Termination during a remote access session could imply a normal, or 'timed' termination of the connection, long after an intended response to unauthorized activity would ordinarily occur.

R4 is applicable to all BES Cyber Systems and, as applicable, EACMS PACS and PCA. The philosophy used by preceding CIP standard drafting teams has been to write any requirements for low impact BES Cyber Systems in Attachment 1 of CIP-003 R2. AEP believes this is a practice that results in a greater potential for compliance of all Responsible Entities. AEP recommends that the essence of R1 be rewritten to address the lower risk associated with low impact BES Cyber Systems and moved to CIP-003 R2 Attachment 1. In addition, CIP-013-1 R4 should be rewritten to be only applicable to high and medium impact BES Cyber Systems.

R1.2.6 is duplicative of R4. These requirements should be made consistent, or one of them should be deleted. Much of R4 is already covered by CIP-005 (R1 and R2), CIP-007 (R4) and CIP-008. Requirements for a single topic should be consolidated within a single standard.

The NSRF believes the following items will cause double jeopardy if there is a non-compliance action with the proposed R4:

R4, Part 4.1 is duplicative with CIP-004-6 R4, Part 4.1

R4, Part 4.2 is duplicative with CIP-007-6 R4, Part 4.1

R4, P4.3 should be taken care of by complying with CIP-005-5. Part 1.3 of CIP-005-5 requires inbound and outbound access permissions which prevent unauthorized activity.

Remove “disable or other responding” and replace with “ ”. Leave the options for response with the Register Entity.

Comment

Southern Company strongly disagrees with the direction the proposed R4 requirement is taking, while recognizing the time constraints placed on the SDT to file a new or modified Standard addressing Supply Chain risks. As currently drafted, R4 carries significant overlap and repetition with existing CIP Standards, specifically with CIP-004-6 R4, CIP-005-5 R1, CIP-007-6 R4, and CIP-008-5 R2. “Authorization of remote access” should be deleted because in no way can you circumvent CIP-004-6 R4.1 requiring authorization of remote access to a high or medium impact BES Cyber System and there is no need to replicate that requirement again in this Standard. Additionally, CIP-005 R1.3 requires explicit access permissions and documented business justifications for all ‘system-to-system’ access, including vendor-initiated access. With respect to “logging and monitoring”, and the detection of “unauthorized activity”, we have serious concerns over the proposed language and provide that CIP-005-5 R1.5 already requires the detection of inbound and outbound malicious communications, CIP-007-6 R4 already requires the

logging and controlling of access at each ESP boundary and to BES Cyber Systems, and CIP-008-5 R2 already requires response to detected Cyber Security Incidents, which includes unauthorized activity during a vendor remote access session. As drafted, a failure to comply with R4 could place a Responsible Entity in possible double jeopardy with those other requirements. Additionally, as written, R4 creates a scope expansion of the existing CIP-005-5 R1.5 currently applicable to High Impact BES Cyber Systems and Medium Impact BES Cyber Systems at Control Centers to now ropes in all Medium Impact BES Cyber Systems – leaving entities (and auditors) to determine "which Standard wins?"

Based on those concerns, Southern Company recommends the complete removal of R4 from the Standard, and where additional controls not already covered in an existing Standard are directed in the FERC Order, those controls should be covered under "the plan(s)" under R1 in a similar manner as the proposed edits provided under R1.

If R4 is not removed in this manner, we provide the below edits for consideration with the following comments. In addition to the justified removal of "authorization of remote access", logging and controlling are achievable concepts due to their requirement under existing Standards and therefore should not be required again here in this Standard and removed. This leaves "methods to disable remote access sessions", which we propose moving under the main R4 for the applicable scenarios. Again, detecting and responding to "unauthorized activity" is already required under existing Standards, and should be removed from R4. If not removed, the SDT must address the discrepancy between the scope collision between the draft R4 and CIP-005-5 R1.5.

Additionally, if there is an expectation beyond the use of IDS/IPS for "detecting unauthorized activity", then we would argue that it is nearly impossible for an entity to look at a stream of 1's and 0's flowing by at a several megabits per second and determine whether there is "unauthorized activity" or not in that stream. With the difficulty in determining "unauthorized activity" in a stream of bits flying by, we respectfully recommend striking this and request the SDT to consider focusing the controls in this requirement specifically to having methods to rapidly "disable remote access" to prevent remote control of entity assets.

Modify R4 language as follows:

R4. Each Responsible Entity shall implement one or more documented process(es) for controlling vendor remote access to high and medium impact BES Cyber Systems. The process(es) shall address methods to disable remote access sessions for (i) vendor-initiated Interactive Remote Access and (ii) system-to-system remote access with a vendor(s). [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

ERCOT supports the IRC comments and offers the following supplemental comments.

Requirement R4 is duplicative of existing requirements in CIP-004, CIP-005, CIP-007, and CIP-008. The drafting team should consider modifications to these existing standards rather than creating new requirements in a new standard. By placing these requirements in a stand-alone Standard, there is a possibility that entities may not make necessary connections to the prerequisites of some requirements (e.g., CIP-004 R2, R3) and downstream obligations of other requirements (e.g., CIP-008). ERCOT offers the following suggestions for realignment:

Requirements for electronic access authorization of vendors, including Interactive Remote Access, are addressed within CIP-004 R4, which also addresses the proper vetting and training of said vendors. If the SDT keeps the requirement in CIP-013, the requirement should be modified to address proper pre-authorization requirements.

Requirements for Interactive Remote Access are already addressed within CIP-005 R2. Vendor-initiated remote access is just one example of Interactive Remote Access. If the SDT keeps the requirement in CIP-013, the requirement should be modified to address proper configuration of remote access (e.g. multi-factor authentication, encryption, Intermediate System).

Requirements for system-to-system communications are already addressed within CIP-005 R1. This requirement could be added to CIP-005 R1 or as an addition to R2. The heading for Table 2 within CIP-005 can be modified to “Remote Access” in support of this. If the SDT keeps the requirement in CIP-013, the requirement should be modified to address proper network controls for the system-to-system communication (e.g. ESPs, EAPs, etc.).

Requirements for logging and monitoring of access activity are addressed in CIP-007 R4. If the SDT keeps the requirement in CIP-013, the requirement should be modified to identify the logging specifications that differ from CIP-007 R4. Requirements for response to unauthorized activity are already addressed within CIP-008. If the SDT keeps the requirement in CIP-013, the requirement should be modified to identify integration with CIP-008. There are also several instances in the standard where language needs to be clarified. The drafting team should state whether system-to-system remote access includes "phone home" capabilities that are used for reporting of licensing, system health, and system problems. Requirement R4.1 should be clarified to specify whether it is addressing authorization of each remote access session or remote access to the vendor in whole. The drafting team should consider whether this requirement is consistent with current requirements in CIP-004 R4. The drafting team also needs to address authorization of software companies that use a "follow-the-sun" support model. Follow-the-sun is a type of global support where issues are passed around daily between work sites that are many time zones apart. Such a support increases responsiveness. As noted with other requirements in the draft CIP-013 standard, the drafting team should address situations in which vendors will not or cannot provide the levels of service mandated by this requirement. This requirement puts a substantial responsibility on the Responsible Entity without any authority or recourse if the vendor is unwilling to agree. To address the concern, the drafting team should include a limited exemption from compliance, such as a Technical Feasibility Exception (TFE), which would protect Responsible Entities in the event a vendor is unwilling to agree to the terms otherwise required by R4. NERC's Appendix 4D to the Rules of Procedure provides for a basis of approval of a TFE beyond strict technical limitations of a system. (See Section 3.0 of the appendix.)

1) R4 creates confusion and possible double jeopardy with other standards. Recommend moving R4 into the following Standards/Requirements CIP-005 R2, CIP-007 R4 Subpart 4.1.5 and/or CIP-008 R1 part 1.6 to address FERC order No. 829.

2) Recommend that this Rationale needs to be updated from “machine-to-machine” to “system-to-system” for consistency

3) The first sentence of R2 is broader than the second sentence. The first sentence is “Each Responsible Entity shall implement one or more documented process(es) for controlling vendor remote access to high and medium impact BES Cyber Systems.” The second sentence is “The process(es) shall provide the following for (i) vendor-initiated Interactive Remote Access and (ii) system-to-system remote access with a vendor(s):“ Recommend that the first sentence needs to be consistent with the Order and reference *vendor-initiated* remote access and not *vendor* remote access.

4) Request guidance. “Vendor-Initiated” could be considered a single word and not associated with the proposed definition of “vendor”.

5) Recommend changing R4.3, from “Disabling or otherwise responding to unauthorized activity during remote access sessions“ to “Disabling or otherwise responding to *detected* unauthorized activity.“

6) The phrase “during remote access” does not seem to align with the “timely manners” guidance given on page 15, line 23 of the Guidance and Examples document. This capability to disable during the remote access session may not always be possible and would be dependent on how the unauthorized activity was detected.

Consider eliminating sub requirements 4.1 and 4.2 since they are covered in CIP-005 and CIP-007, R5 respectively. Consider addressing sub requirement 4.3 by modifying CIP-005 thus eliminating R4 from the proposed CIP-013 standard.

R4 should be moved to CIP-005 since this requirement, as written in CIP-013, only applies to vendors having remote access. This does not address other sources of remote access threats as written.

For R4.2, we suggest limiting the retention period for evidence logs to 90 days to be consistent with CIP-007 R4, Parts 4.1, 4.2, and 4.3.

This would increase the scope of file integrity monitoring to Medium impact devices, some which are not capable of logging. This would discourage entities from allowing vendors to ever log in remotely, which might hinder reliability in the case of required emergency troubleshooting/support. Lack of timely support would also force entities to be non-compliant with other standards, such as other CIPs.

Remove vendor remote access from scope and only include system-to-system. Vendor remote access is already addressed in CIP-005 R2. SDT appears to be building on top of CIP-005 R1.5; however, R4.3 says “during the remote access session,” which may not reasonable amount of time since this is a real-time action.

Control of Interactive Remote Access to High and Medium Impact BES Cyber Systems is already required by CIP-005-5, Requirement R2. To that end, including that aspect in this Requirement is duplicative to some extent. Similarly, it could be argued that authorization of remote access is covered by CIP-004-6, Requirement R4, and logging of access is required by CIP-007-6, Requirement R4. The Standards Drafting Team should either incorporate the few remaining elements into the existing Requirements in the other CIP Standards, or rewrite this Requirement to only include the additional expectations not covered elsewhere.

Comment

GTC disagrees with the proposed requirement. CIP-013-1 R4 requires actions to be taken by the Responsible Entity that are outside of the supply chain context. FERC Order 829 specifically stated in paragraph 45 that the plan should address the security objectives in "the context of addressing supply chain management risks." NIST 800-53 provides a definition of supply chain that is as follows: "Linked set of resources and processes between multiple tiers of developers that begins with the sourcing of products and services and extends through the design, development, manufacturing, processing, handling, and delivery of products and services to the acquirer." FERC Order 829 acknowledges this definition in paragraph 32, footnote 61. However, the SDT has chosen to identify controls in R4 that are executed only as part of the day-to-day management of BES Cyber Systems and introduce double jeopardy with existing CIP Reliability Standards.

R4 as written contains three parts to each be implemented for "(i) vendor-initiated Interactive Remote Access and (ii) system-to-system remote access with a vendor(s)."

4.1: Authorization of remote access. Electronic access to high and medium impact BES Cyber Systems, whether local or remote, and regardless of whether the individual is a vendor, is already required by CIP-004-6 R4, Part 4.1. System to system remote access must be explicitly permitted through the ESP along with documented justification according to CIP-005-5 R1, Part 1.3.

4.2: Logging and monitoring of remote access sessions: CIP-005-5 R1, Part 1.5 requires methods for detecting malicious communications for high impact BES Cyber Systems and medium impact BES Cyber Systems at Control Centers. CIP-007-6 R4, Part 4.1 requires logging of successful and failed access attempts. The applicable systems for CIP-007-6 R4, Part 4.1 includes EACMSs associated with medium and high impact BES Cyber Systems, effectively including logging that occurs at the perimeter of the ESP as well as access to the BES Cyber Systems directly. CIP-007-6 R4 additional requires monitoring of the logs.

4.3: Disabling or responding to unauthorized activity: CIP-008-5 R2 requires that entities respond to unauthorized activity according to their defined incident response plans. As a Cyber Security Incident includes any incident that "compromises, or was an attempt to compromise, the ESP…" or "disrupts, or was an attempt to disrupt, the operation of a BES Cyber System," response to any unauthorized activity (whether local or remote, physical or electronic) is already required by CIP-008-5 R2.

That said, there are gaps remaining between the existing CIP standards and the directive as specified by FERC Order 829.

As such, all controls required by CIP-013-1 R4 already exist in other CIP Reliability Standards, effectively making any non-compliance with R4 a case of double jeopardy with either CIP-004-6 R4, CIP-005-5 R1, CIP-007-6 R4, or CIP-008-5 R2, depending on the facts and circumstances of the specific compliance issue. While CIP-013-1 R4 suggests the implementation of technical security controls, it is unclear what additional controls would be implemented that are not already required by the existing CIP Standards. CIP-013-1 R4 only provides for additional paperwork, administrative burden, and double jeopardy compliance risk. As such, the standard drafting team should not create additional requirements for which entities are already being audited against and it should be removed.

That said, we do believe that addressing remote access in the supply chain context (not in the day-to-day operations context) could provide supply chain security risk management benefits. Unfortunately, the SDT has not constructed its requirement as such. Consistent with our response to question 1, we recommend that the SDT consider a plan based approach to addressing security risks in the context of the supply chain.

R4 is written in a manner that implies the Responsible Entity shall implement a separate documented process in addition to the plan specified in R1. Paragraph 45 of Order No. 829, clearly specifies this objective of vendor remote access should be applied to "The Plan" identified in the core directive in the context of addressing supply chain management risks. (P. 45) The plan required by the new or modified Reliability Standard developed by NERC should address, at a minimum, the following four specific security objectives in the context of addressing supply chain management risks: (1) software integrity and authenticity; (2) vendor remote access; (3) information system planning; and (4) vendor risk management and procurement controls. GTC recommends the SDT remove this requirement and include a security objective for vendor remote access in "The Plan" specified in R1 to align with the FERC Order. See GTC's comment for Question #1.

Authorization of Remote Access The existing CIP-004 requirements already address authorization of vendor individuals and CIP-005 requirements address system-to-system authorization. We recommend that the SDT consider deleting Requirement R4, Part 4.1 to avoid this unnecessary overlap. Activity v. Access The use of "activity" in 4.2 and 4.3 is a concern because it may be difficult for a Responsible Entity to determine whether the activity is authorized or unauthorized. Also, there is no such thing as "escorted cyber access." In almost all cases, the reason the Responsible Entity is	

allowing the remote vendor to support the system is that they have knowledge and skills that the Responsible Entity does not. Therefore the Responsible Entity would not be able to recognize inappropriate actions. If "activity" is left, this will likely result in Responsible Entities requiring vendors to perform their work onsite, which will add considerable costs without any security benefits. If the person is doing something inappropriate, they'll be able to do it onsite. We recommend that the SDT consider changing "activity" to "access" in parts 4.2 and 4.3.

Remote Access Session Monitoring

Although the Commission mentions monitoring of third-party initiated remote access sessions, they direct that the standard "must address responsible entities' logging and controlling all third-party (i.e., vendor) initiated remote access sessions." (Order No. 829, P51) The security objective is to address "the threat that vendor credentials could be stolen and used to access a BES Cyber System without the responsible entity's knowledge, as well as the threat that a compromise at a trusted vendor could traverse over an unmonitored connection into a responsible entity's BES Cyber System." (Order No. 829, P 52).

First, the CIP-005 two factor authentication requirement would prevent access via stolen vendor credentials, except for in a sophisticated "Charles Angels" style attack (2000 movie) designed to overcome multifactor authentication, which was not the case in the Ukraine attack.

Second, monitoring remote access sessions to detect unauthorized activity is a method to control unwanted access or a "how" to implement the security objective. There are other methods to address the security objective, including controlled log-in and log-outs for specific activities and limiting the vendor's ability to access BES Cyber Systems.

Third, session monitoring of system to system activity, as prescribed by the proposed standard is not practical due to technology constraints and the likelihood that time sensitive network traffic supporting reliability tasks could be adversely impacted. For example, where a 2 millisecond response is required in an energy management system and continuous monitoring of remote vendor access reduces system response time to 5 milliseconds. Also, technology constraints may prevent Responsible Entities from determining whether a vendor or an employee is accessing the BES Cyber System. These complications may force Responsible Entities from disallowing remote access by vendors, which may actually harm reliability rather than improve it. Vendors know their systems best since they designed and manufactured them and therefore they are in the best position for remote access to complete certain tasks.

To address the concerns, we recommend that the SDT consider changing the "monitoring" language to "control" and focus on the second part of the security objective, controlling persistent machine-to-machine remote access sessions by vendors. Controlling persistent machine-to-

machine remote access is possible by different methods, including one way communications and time limiting access sessions. Vendor Interactive Remote Access is already controlled by CIP-005 requirements.

Disabling/Responding to Unauthorized Activity

Disabling remote access (Part 4.3) may also not be possible and would likely force Responsible Entities to disallow vendor remote access. We recommend that the SDT remove this part.

Requirement Placement (CIP-005)

Because Requirement R4 is an operational control, we recommend that the SDT consider putting this requirement into CIP-005 R2 and not create duplicative requirements.

Definitions

Machine-to-machine or system-to-system remote access is also not defined so it's unclear what new systems this brings into scope for this requirement. If the SDT uses one of these terms, we recommend that they define it. Also, if the SDT uses our suggestion for addressing persistent, machine-to-machine remote access, we also recommend defining persistent, perhaps leveraging the concept used by the transient cyber asset definition. We also recommend that the SDT consider defining vendor, for example, does it include an ISO ICCP connection to an EMS?

We recommend the following language for consideration by the SDT:

R4. Each Responsible Entity shall implement one or more documented method(s) to control persistent, machine-to-machine remote access sessions by vendors to high and medium impact BES Cyber Systems.

Comment	

The IRC and SWG request that the SDT consider moving this requirement to existing CIP Standard to prevent overlap, conflict, or omission of existing requirements.

The SDT should address whether system-to-system access is when vendor-initiated. Lack of clarity there will impact automated updates from vendors that are time-sensitive, as well as outbound connections to vendors for health checks, licensing, and other system information.

This requirement is duplicative of existing requirements within CIP standards.

Authorization of access is covered in CIP-004-6 R4.1. The language in this CIP-004-6 R4.1 does not exclude vendors.

The rationale for CIP-007-6 R4 explicitly states that security event monitoring's purpose is to detect unauthorized activity.

A detection of unauthorized activity would be investigated as a potential Cyber Security Incident and appropriate action would be taken from there.

Comment	

The attached document has comments compiled for all the questions. Please note that the BOLD paragraphs below (YELLOW highlighted in attachment) are uniquely Seattle City Lights. The un-highlighted comments were developed in collaboration with other entities and trade organizations such as LPPC. These comments may be like those submitted by other entities but not necessarily. City Light recognizes the challenges facing the SDT and appreciates the efforts the SDT is placing into working towards developing a solid standard.

Seattle City Light requests that the scope of R4 be limited to high and medium BES Cyber Systems with ERC or Dial-up Connectivity as these systems have the highest risk associated with remote access.

Elements of R4 (authorization, logging/monitoring) appear duplicative of existing CIP electronic access requirements. Seattle City Light requests that the scope of R4 be limited to disabling remote access.

For R4.3, the phrase “during remote access” does not seem to align with the “timely manners” guidance given on page 15, line 23 of the Technical Guidance and Examples document. The capability to disable during the remote access session may not always be possible and would be dependent on how the unauthorized activity was detected. Seattle City Light requests changing the language to “upon detected unauthorized activity”.

Furthermore, because it may not be technically feasible to remotely disable a vendor from equipment provided by that vendor (which the entity purchased from them, and may be dependent upon the vendor for maintenance), Seattle City Light requests the inclusion of a Technical Feasibility Exception (TFE) for R4. Seattle City Light suggests the following language: "WHERE TECHNICALLY FEASIBLE, each responsible entity shall implement one or more documented process(es) for controlling vendor remote access to…" (emphasis added).

Rationale for Requirement R4:

The rationale language for R4 states, “The proposed requirement addresses Order No. 829 directives for controls on vendor-initiated remote access to BES Cyber Systems covering both user-initiated and machine-to-machine vendor remote access (P. 51).” R1, R2, and the Rationale for Requirement R3 and R4 do not specify the impact classifications (High, Medium and Low) when referencing the BES Cyber System. R3 and R4 specifically state the impact classification of the BES Cyber System “applicable to High and Medium Impact BES Cyber Systems (R3)” or “Each Responsible Entity shall implement one or more documented process(es) for controlling vendor remote access to high and medium impact BES Cyber Systems (R4).” IPC would like to know if the inconsistent impact classification references were intended or were an oversight by the SDT?

R4

IPC does not believe CIP-013-1 is an appropriate standard to address R4.1, R4.2 and R4.3. IPC believes R4.1 belongs in CIP-004-6, as R4.1 is related to authorization and R4.2 and R4.3 belongs in CIP-005-6 as R4.2 and R4.2 are related to remote access. IPC feels the intent of CIP-013-1 is to address supply chain controls, whereas CIP-004-6 addresses access management and CIP-005-6 addresses remote access.

M4 Some of the measure language for R4 states, “hard copy or electronic listing of alert capabilities applicable to vendor remote access of the BES Cyber System; or records of response to unauthorized vendor remote access.“ R1, R2, and the Rationale for Requirement R3, R4, and M4 do not specify the impact classifications (High, Medium and Low) when referencing the BES Cyber System. R3 and R4 specifically states the impact classification of the BES Cyber System “applicable to High and Medium Impact BES Cyber Systems (R3)” or “Each Responsible Entity shall implement one or more documented process(es) for controlling vendor remote access to high and medium impact BES Cyber Systems (R4).” IPC would like to know if the inconsistent impact classification references were intended or were an oversight by the SDT?

Though each of the objectives in Order 829 is addressed, Reclamation recommends a more simplified format for the requirements as the SDT originally suggested in the webinar on November 10, 2016. Reclamation recommends that Requirement R4 be deleted. There would be no need for Requirement R4 if all aspects of the supply chain risk management plan(s) are to be addressed in Requirement R1 and its sub-requirements.

1. As mentioned above, the standard drafting team should not create additional requirements for which entities are already being audited against. This creates confusion and risks the entity to being in double jeopardy for the same activity. R4, Part 4.1 is covered under CIP-004-6 R4, Part 4.1 R4, Part 4.2 is covered under CIP-007-6 R4, Part 4.1 R4, P4.3 is covered under with CIP-005-5. Part 1.3 of CIP-005-5

Requirement R4: ATC agrees with the value provided through the implementation of controls to address logging and controlling third-party initiated remote access; however, ATC has voted “No” to the proposed language developed CIP-013-1 Requirement R4 because existing Reliability Standards accomplish this objective rendering the need for this requirement in CIP-013-1 moot. In its redundancy, it is at odds with the former efforts	

associated to the FERC filing of proposed retired standards for Project 2013-02 Paragraph 81, and the intent to eliminate duplicative or unnecessary requirements that do not provide security or reliability value.

Requirement R4 Sub Requirement 4.1 – 4.3:

CIP-013-1 R4 is simultaneously duplicative and additive to the language and/or intent of several existing approved and effective CIP Cyber Security Reliability Standards and is therefore providing no additional security or reliability value and creating a condition of double jeopardy for Registered Entities where a violation of CIP-013-1 R4 would constitute a violation of another CIP Standard and requirement.

CIP-004-6 R4 and R5 address access management and revocation for individuals having cyber access to specified high and/or medium impact-rated BES Cyber Systems and associated Cyber Assets. The existing enforceable CIP-004-6 standard is silent to the capacity with which a given individual is engaged with a Registered Entity, and therefore in its silence it addresses employees, contractors, interns, apprentices, or even vendors etc. These access requirements within CIP-004-6 are more prescriptive than what is proposed for CIP-013-1 therefore providing no additional security or reliability value and ultimately rendering CIP-013-1 R4.1 superfluous and unnecessary.

CIP-005-5 R1 Parts 1.1 – 1.4 addresses CIP-013-1 R4(i), R4.1, ultimately rendering CIP-013-1 R4(i), R4.1 superfluous and unnecessary in that:

o CIP-005-5 R1 Parts 1.3 mandates authorization for system-to-system remote access through the requirement for inbound and outbound access permissions through an identified Electronic Access Point protecting high and/or medium impact-rated BES Cyber Systems,

where those BES Cyber Systems must already be protected as a function of being inside an identified Electronic Security Perimeter pursuant to CIP-005-5 Requirement R1 Part 1.1, and

where all External Routable Connectivity must be through an identified Electronic Access Point pursuant to CIP-005-5 Requirement R1 Part 1.2.

o Additionally, CIP-005-5 R1 Part 1.4 obligates Registered Entities to perform authentication for establishing Dial-up connections to high and/or medium impact-rated BES Cyber Systems, where technically feasible. The broad reference to system-to system remote access (which is silent to Dial-up) in combination with the absence of the provision for technical feasibility within this draft Requirement is effectively and expansion in scope to the already approved and enforceable CIP-005-5 R1 Part 1.4 Reliability Standard. Any expansion in scope to remote access requirements or controls for high or medium impact BES Cyber Systems as defined in the currently approved and enforceable Standard should be subject to the Standards Authorization Request, Development, Commenting, and Balloting Processes for CIP-005-5 so as not to be

effectively revising an existing approved and enforceable Reliability Standard through the creation of a separate one. Furthermore, it is a contradiction between standards where compliance with one requirement in CIP-005-5 R1 Part 1.4 through a CIP Senior Manager and regional regulator approved Technical Feasibility Exception becomes a matter of non-compliance pursuant to CIP-013-1 R4.

CIP-005-5 R2 Parts 2.1 – 2.3 and CIP-007-6 R5 Parts 5.1 goes beyond in addressing CIP-013-1 R4(ii), R4.1, ultimately rendering CIP-013-1 R4(ii), R4.1 superfluous and unnecessary in that:

o CIP-005-5 R1 Parts 2.1 mandates authorization for all Interactive Remote Access (IRA) (including vendor-initiated IRA) through the requirement to use an Intermediate System such that any remotely-initiated IRA does not directly access the high and/or medium impact-rated BES Cyber System(s),

o where those Intermediate System must also utilize encryption that terminates at the Intermediate System pursuant to CIP-005-5 Requirement R2 Part 2.2, and

o where all IRA sessions must require multi-factor authentication pursuant to CIP-005-5 Requirement R2 Part 2.2.

o CIP-007-6 R5 Parts 5.1 further mandates methods to enforce authentication of interactive user access (including vendor-initiated users) where technically feasible for high and/or medium impact-rated BES Cyber System(s),

CIP-005-5 R1 Parts 1.2 - 1.5, in combination with CIP-007-6 R4 Parts 4.1-4.4 and CIP-007-6 R5 Part 5.7 collectively addresses, and in some cases exceeds, the logging, monitoring, and detection of unauthorized activity proposed in CIP-013-1 R4, R4.2, ultimately rendering in CIP-013-1 R4, R4.2 superfluous and unnecessary in that:

o CIP-005-5 R1 Part 1.5 mandates one or more methods for detecting known or suspected malicious communications both inbound and outbound on the Electronic Access Points protecting high and/or medium impact-rated BES Cyber System(s), and because all remote access must also be through an identified Electronic Access Point pursuant to CIP-005-5 Requirement R1 Part 1.2, the two existing enforceable requirements in combination already satisfying the detection component intended by CIP-013-1 R4, R4.2; and consequently, the detection component intended by CIP-013-1 R4, R4.2 adds no security or reliability value and rather creates a condition of potential double jeopardy for existing approved and enforceable Standard CIP-005-05 R1.

o CIP-007-6 R4 Parts 4.1-4.4 mandates that, per BES Cyber System capability or at the Cyber Asset level for high and/or medium impact-rated BES Cyber System(s),

specified access-related events are logged,

alerts are generated for said events,

event logs are retained as technically feasible for 90 consecutive calendar days except in CIP Exceptional Circumstances,

thereby already satisfying the logging and monitoring component intended by CIP-013-1 R4, R4.2; Consequently, the logging and monitoring component intended by CIP-013-1 R4, R4.2 adds no security or reliability value and rather creates a condition of potential double jeopardy for existing approved and enforceable Standard CIP-007-6 R4 that is also at odds with efforts associated to the FERC filing of proposed retired standards for Project 2013-02 Paragraph 81, and the intent to eliminate duplicative or unnecessary requirements that do not provide security or reliability value.

Furthermore, in its redundancy of CIP-007-6 R4, CIP-013-1 R4, R4.2 is simultaneously an expansion in scope in that CIP-013-1 R4, R4.2 is silent to the provisions for “Per Cyber System capability”, per cyber Asset capability”, “technical feasibility”, and “CIP Exceptional Circumstances”, is effectively and expansion in scope to the already approved and enforceable CIP-007-6 R4 Reliability Standard. Any expansion in scope to logging, monitoring, or detection activity related to requirements or controls for high or medium impact BES Cyber Systems as defined in the currently approved and enforceable Standard should be subject to the Standards Authorization Request, Development, Commenting, and Balloting Processes for CIP-007-6 so as not to be effectively revising an existing approved and enforceable Reliability Standard through the creation of a separate one. Furthermore, it is a contradiction between standards where compliance with one requirement in CIP-007-6 R4 through:

- a CIP Senior Manager and regional regulator approved Technical Feasibility Exception,
- a CIP Senior Manager approved CIP Exceptional Circumstance,
- a documented per BES Cyber System incapability, and/or
- a documented per Cyber Asset incapability

becomes a matter of non-compliance pursuant to CIP-013-1 R4.2

o CIP-007-6 R5 Part 5.7 mandates limiting of the number of unsuccessful authentication attempts or the generation of alerts of unsuccessful authentication attempts exceeding a Registered Entity defined threshold, where technically feasible and scope to high impact BES Cyber Systems and medium impact BES Cyber Systems at Controls Centers. The broad reference high and medium impact BES Cyber Systems, in combination with the absence of the provision for technical feasibility within this draft Requirement for CIP-013-1 R4 is effectively and expansion in scope to the already approved and enforceable CIP-007-6 R5.7 Reliability Standard. Any expansion in scope to logging, monitoring, or detection activity related to requirements or controls for high or medium impact BES Cyber Systems as defined in the currently approved and enforceable Standard should be subject to the Standards Authorization Request, Development, Commenting, and Balloting Processes for CIP-007-6 so as not to be effectively revising an existing approved and enforceable Reliability Standard through the creation of a separate one. Furthermore, it is a contradiction between standards where compliance with one requirement in CIP-007-6 R5 Part 5.7 through a CIP Senior Manager and regional regulator approved Technical Feasibility Exception becomes a matter of non-compliance pursuant to CIP-013-1 R4.

OUC requests that the scope of R4 be limited to high and medium BES Cyber Systems with ERC or Dial-up Connectivity as these systems have the highest risk associated with remote access.

Elements of R4 (authorization, logging/monitoring) appear duplicative of existing CIP requirements. OUC requests that the scope of R4 be limited to disabling remote access. For R4.3, the phrase "during remote access" does not seem to align with the "timely manners" guidance given on page 15, line 23 of the Technical Guidance and Examples document. The capability to disable during the remote access session may not always be possible and would be dependent on how the unauthorized activity was detected. OUC requests changing the language to "upon detected unauthorized activity".

The Technical Guidance and Examples state that "for Requirement R4 Part 4.1, an entity may already have some authorization controls in place that will support meeting this objective", including CIP-004 and CIP-007 R5 controls if they are fully implemented for vendor-initiated Interactive Remote Access. Please confirm that implementation of these controls for all remote access, vendor or entity initiated, would meet compliance with this requirement. If so, would it be beneficial to caveat the requirement and have it read "**4.1** Authorization of remote access, not previously approved by CIP-004, by the Responsible Entity?"

A responsible entity may have numerous contractors from various vendors that perform a number of tasks within CIP environments that are on-site, sitting right next to employees engaged in similar activities. Both the contractors and the employees normal work process may have them utilize Interactive Remote Access to perform their responsibilities efficiently. Are these contractors, embedded and onsite, to have each of their connections explicitly approved and monitored at a different level of scrutiny than actual employees of the responsible entity, simply because they are not employees? Or will there be a distinction between on-site and off-site "vendors?"

Document Name	
Comment	
R4 could give entities the impression that they do not need to follow the CIP-005-5 R2 controls for Interactive Remote Access. If an entity did not leverage its existing Interactive Remote Access (CIP-005-5 R2) processes to support this Requirement, WECC is concerned that separate vendor remote access processes may provide additional ingress/egress points into the ESP. An entity should ensure that vendor remote processes are protected at least to the level of CIP-005-5 R2. At no point in time, should there ever be an unmonitored connection into a BCS. This is something that is totally under the control of the entity. Even if the vendor includes a "phone-home" feature on a system or application, the ingress and egress of that connection should still be monitored and controlled by the entity to minimize the risk of third-party penetration into the BCS. The SCRM team should work closely with the CIP-005-5 team to ensure all remote access connections are managed, monitored, and controlled through an Electronic Access Control and Monitoring System [EACMS] and/or Intermediate System [IS]

While in overall agreement with this Requirement R4, ACEC would recommend the following change: 1. Move Requirement 1, Part 1.2.2, "Process(es) for notification when vendor employee remote or onsite access should no longer be granted" and Part 1.2.6 "Coordination of remote access controls for (i) vendor-initiated Interactive Remote Access and (ii) system-to-system remote access with a vendor(s)" to Requirement R4 since this requirement is where Vendor Remote Access is addressed.

Sheranee Nedd - Public Service Enterprise Group, Public Service Electric & Gas, PSEG Fossil LLC, PSEG Energy Resources & Trade LLC - 1,3,5,6 - NPCC,RF, Group Name PSEG REs	
Answer	Yes
Document Name	
Comment	
PSEG agrees with the intent of this requirement, but has the following questions/recommendations below: • Recommend changing Requirement 4.3, from "Disabling or otherwise responding to unauthorized activity during remote access sessions" to "Disabling or otherwise responding to detected unauthorized activity associated with remote access sessions." PSEG finds that inclusion of the word "during" in the requirement overreaches the intent of relevant FERC directive (p.51).	

- Requirements R1 and R2 do not require the registered entity to go back and revise previous contracts. In order to comply with this requirement, R4, past contracts / vendor service agreements may be required. Alignment is needed between R1, R2, and R4.

- Vendor-initiated Interactive remote access is no different than Interactive remote access. Recommendation to incorporate Requirement R4 into CIP-007 R5 System Access Control.

- Requirement R4 overlaps with CIP-005 for Interactive Remote Access, which applies to vendors, only 4.2 monitoring and 4.3 is new. Recommend streamlining R4 to fit in CIP-005 R2.

- Recommend changing “activity” to “access”. Use of the word “activity” in 4.2 and 4.3 because it may be difficult for a Responsible Entity to determine whether the activity is authorized or unauthorized. In almost all cases, the vendor has more in depth technical knowledge of the system they developed beyond the Registered Entity’s level of expertise on the system. Therefore it would be difficult for the Responsible Entity to recognize inappropriate actions/activity. If “activity” is left, this will likely result in Responsible Entities requiring vendors to perform their work onsite, which will add considerable costs without any security benefits. If the person is doing something inappropriate, they’ll be able to do it onsite. If the intent of this requirement is to monitor “unauthorized activity”, the term “unauthorized activity” should be defined.

Comment

AZPS requests changing Requirement R4.3 to read ‘disabling or otherwise responding to **detected,** unauthorized activity during remote access session’. It further notes that, as written, the proposed Requirement R4 would place Registered Entities in “double jeopardy” where similar

controls are already required under CIP-004-6. Accordingly, AZPS requests that the SDT consider revising this requirement to remove such redundancy or to include a clarification regarding how this risk for "double jeopardy" will be managed relative to access controls required under CIP-004-6.

5. The SDT developed CIP-013-1 Requirement R5 to address Order No. 829 directives for (i) verifying software integrity and authenticity; and (ii) controlling vendor remote access, as they apply to low impact BES Cyber Systems (P 48 and P 51). Do you agree with the proposed requirement? If you do not agree, or if you agree but have comments or suggestions for the proposed requirement provide your recommendation and explanation.

Summary Consideration. The SDT thanks all commenters. The SDT has removed low impact BES Cyber Systems from applicability of CIP-013-1 and is not proposing any new requirements to address cyber security supply chain risks for these cyber systems. The SDT believes that the CIP-013-1 proposed applicability to high and medium impact BES Cyber Systems appropriately focuses industry resources on supply chain cyber security risk management for industrial control system hardware, software, and computing and networking services associated with BES operations, as specified in Order No. 829.

Joseph DePoorter - MGE Energy - Madison Gas and Electric Co. - 4, Group Name MRO NSRF	
Answer	No
Document Name	
Comment	

The NSRF does not understand the intent of the following:

R1 is applicable to “Each Responsible Entity” is to implement “one or more supply chain risk management plans”.

R2 is applicable to “Each Responsible Entity” is to review and update its “supply chain risk management plans” at least once every 15 calendar months.

R5 is applicable to “Each Responsible Entity” with at least one “low impact BES Cyber System” will have a documented “cyber security policies “ which require “review and approval” at least once every 15 calendar months.

For R5.1, imposes a requirement at the BES Cyber Asset level rather than at the BES Cyber System level. Consider removing R5.1 or reworking so it is applicable at the BES Cyber System level.

The NSRF has concerns with R5. As written, every entity with a "low impact BES Cyber System" is required to have "cyber security policies" (note policies should be changed to "policy(s)). This would include entities that have High and Medium impact BES Cyber Systems, as long as they have one "low impact BES Cyber System", too. Plus, R5.1 is a duplicate of R3 and R5.2 is a duplicate of R1.2.6.

This will cause double jeopardy for Each Responsible Entity in R1, R2, and R5. The "Responsible Entities" statement within each Requirement contains "High, Medium, and Low BES Cyber Systems". So everywhere "Responsible Entity" is used in the Standard, that requirement applies to everyone with High, Medium, and Low BES Cyber Systems.

The NSRF believes that this is NOT the intent of R5. If the intent of R5 is to have control for Entities with "low impact BES Cyber Systems" **only** then, it should be clearly stated. Such as:

*"R5. Each Responsible Entity with at least one asset identified in CIP-002, containing low impact BES Cyber Systems **only,** shall have one or more documented cyber security policies, which shall be reviewed and approved by the CIP Senior Manager or delegate at least once every 15 calendar months, that address the following topics for its low impact BES Cyber Systems:"*

Comment

Requirement 5.1 needs to be removed. Currently patching is not required as a function for low impact assets. Until vulnerability and patching is made a requirement for low impact assets, then it is not possible to ensure that "all" patches for low impact assets be validated for authenticity. Additionally, given the issues with trying to validate authenticity for software and patches in general (see our comments on R3)

then this sub-requirement cannot be enforced. The sub-requirement for remote access is valid and should be implemented for low impact assets.

Donald Lock - Talen Generation, LLC - 5	
Answer	No
Document Name	
Comment	
R5 fundamentally does not work as a low-impact scale-back of R3 and R4, because it can be meaningfully implemented only on a Cyber Asset level, and CIP-002-5.1 (R1.1.3) and CIP-003-6 (R2) do not require identification of Cyber Assets for low-impact BES Cyber Systems. The entire concept of R5 needs revision. The difference between supply chain risk management policies, as called-for in R5, and processes, mandated in R3 and R4, is unclear. TFE opportunity is again needed, nor should there be any obligation to impose measures on vendors (see our “additional comments” responses).

Document Name	
Comment	
AEP is concerned about low impact BES Cyber Systems being included here because it may incentivize a lack of action on those systems in order to avoid compliance obligations. AEP believes the Standard should be reasonable for all to achieve, and this may create a significant recordkeeping burden for low impact systems. R5, as proposed, only requires a “documented policy”. Responsible entities could manage the risk appropriately for their circumstances without a requirement to “implement”.

These risks should be evaluated during the procurement and deployment of vendor products and services (CIP-013-1 R1), and mitigated as part of the CIP-005 R2 and CIP-007 R2.

IID does not agree with including Low Impact BES Cyber Systems in this standard as there is not currently a requirement to conduct an inventory of equipment and software or identify systems. As written, this requirement will place additional administrative burden on entities and the impacts are not fully understood. The SDT would need to clarify measures that would serve as evidence. As mentioned above, if the SDT feels that gaps remain, SRP feels that the modifications should be made in the standard where the topic is already addressed (CIP-003).

Additionally, IID feels that there should be exclusion comparable to a CIP Exceptional Circumstance (or TFE) added to this requirement for situations where the vendor does not cooperate or is otherwise unavailable.

Brian Millard - Tennessee Valley Authority - 1,3,5,6 - SERC, Group Name Tennessee Valley Authority	
Answer	No
Document Name	
Comment	
The current CIP requirements for BCS at low impact sites do not require identification of patch sources, or other patching procedural controls. Introducing R5 inadvertently requires utilities to develop a CIP-007 R2 program for low sites as well to be able to address software integrity. This policy would also require a software list and inventory of systems to provide evidence that the policy has been followed. Implementing CIP-013 essentially applies controls from CIP-005, CIP-007, CIP-008, and CIP-010 to BCS at low impact sites where there are no corresponding requirements within the existing CIP standards. For example, it is incongruous to require verification of patches on a low BCS for which there is no requirement to patch.

Smaller generation facilities are heavily dependent on the Original Equipment Manufacturers, and do not have the leverage to promote participation from large sole sources. How do facilities develop processes to verify integrity and authenticity of software and firmware, when OEMs don't offer guidance on validation? The sole sources also do not have the incentive to adhere to the same level of compliance when these assets are in their care, such as when embedded cyber assets are shipped off site to the OEM, or when service engineers are on site for commissioning. Enhanced compliance requirements discourages equipment servicing from the owner, and places more reliance on the OEM.

Anthony Jablonski - ReliabilityFirst - 10	
Answer	No
Document Name	
Comment	
Requirement R5 speaks to documenting a policy or policies to address 5.1 and 5.2 for low impact BCS. The word “implement” is not in this requirement. Absent including the implementation piece, there is no requirement to implement the controls just document them. Furthermore, the SDT made it clear in Requirement R3 and R4 that an entity shall implement one or more documented process(es) for the actual security controls or processes. Similar language (implement documented process(es)) should be included in R5 versus policy. Even though the rationale section speaks to policies and processes, the language of the requirement only speaks to policies. This will drive consistent implementation across all BCS impact levels. ReliabilityFirst offers the following modifications for consideration to address our concern: R5. Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BES Cyber Systems shall [implement] have one or more documented cyber security policies [or processes], which shall be reviewed and approved by the CIP Senior Manager or delegate at least once every 15 calendar months, that address the following topics for its low impact BES Cyber Systems:

Comment	

We request consistency in the use of terms between R1 and R5; R1 uses the term “plan” and R5 uses the term “process” or “policy”. We understand the term “plan” to mean a more high-level document that communicates management goals and objectives. We request clarification that the use of the term “policy” in R5 is meant to be a similar concept, i.e., that R5 is satisfied by a document that is reviewed and approved by the CIP Senior Manager that is a high-level document that communicates management goals and objectives, rather than a detailed process document with instructions to achieve the requirements. We seek this clarification because in the Technical Guidance and Examples (page 16 lines 29-31), the SDT writes “or alternatively develop a separate cyber security policy or process(es) to address low impact BES Cyber System.” As described previously by the Version 5 SDT, a documented process and a policy are two different documents: a policy is a document used to communicate management goals and objectives, while a process is a set of required instructions specific to achieving the requirement. Based on the SDT’s comments in the Technical Guidance and Examples, it is unclear which will satisfy R5 and how it will be audited.

Clarification is also requested on whether “system to system” access applies to access that is “one-way” where the remote end conducts only monitoring activity and no control is possible. Can the procedure for access make distinctions for each methods of monitoring each type of access, Interactive Remote, system to system with control and system to system for monitoring only?

Additionally, we request confirmation that if vendors refuse or can’t provide hashes or other verification methods, an internal process to test, scan and perform verification activities be enough to satisfy requirement R5.1.

AECI has concerns that R5, as written, would place Responsible Entities that have a combination of High, Medium, and low impact BES Cyber Systems at risk of double jeopardy. Part 5.1 is a duplicate of R3 and R5.2 is a duplicate of R1.2.6. This requirement should be removed from CIP-013-1 and addressed in CIP-003, R2, Attachment 1.

Comment

The industry and previous drafting teams approved the concept that all standards that impact low impact asset be contained in CIP-003. Recommend moving CIP-013 R5 to CIP-003.

R5.1 is not consistent with R1.2.5, should R5.1 include the term “that are intended for use” to read “Integrity and authenticity of software and firmware and any patches, updates, and upgrades to software and firmware that are intended for use; and”

Concerned that in R5.2 the term “controlling” is not defined and is not consistent with the High/Medium language in R4. As an implementation of operational controls R5 needs to be a process not a policy. If this is a policy, then suggest removing “controlling”

There should be exclusion comparable to a CIP Exceptional Circumstance added to this requirement for situations where the vendor does not cooperate or is otherwise unavailable.

If the intent of R5 is the same as R3/R4 for the High/Medium then R5 should require “one or more documented processes” and not a policy. R5 should be a plan document and not a policy document.

Request clarification. To be the consistent with the policies approval in CIP-003 R1, then only the CIP Senior Manager can approve (not a delegate). Is this the SDT's intent?

CIP-013-1 R5 should be placed within CIP-003 in order to keep consistency with the approach used in the remaining CIP standards. Low impact requirements were placed in CIP-003 in order to keep all requirements within a single standard and requirement. By adding these requirements into a new standard, there is confusion resulting in an increased likelihood of a violation.

Guidance language should be added for the auditing process within the standard's guidelines and technical basis (not in a separate document). Not including this in the standard places no obligation on the auditors. Without this guidance language, the auditors could choose to audit in a near zero defect manner, as opposed to a quality of program manner. Providing clear guidance sets expectations for the entities.

• This Requirement should be removed from the Standard. For consistency with the other CIP Standards (e.g. compare to the current draft revision of CIP-003-7i standard where Transient Cyber Asset language for assets that contain Low Impact BCS is included) applicability of supply chain risk management to assets that contain Low Impact BCS should be consigned to CIP-003, R1.2 and R2: o R2 – Attachment 1 should be expanded to include a Section for supply chain risk management (to include controls on software authenticity for Low Impact BCS, controlling vendor remote access to Low Impact BCS) o R1.2 – should be expanded to include supply chain risk management plan(s) with controls for assets that contain Low Impact BCS • The NERC Glossary of Terms definition of CIP Senior Manager will require update to include CIP-013

Basin Electric would prefer low impact requirements be included in CIP-003 rather than CIP-013. For R5.1, imposes a requirement at the BES Cyber Asset level rather than at the BES Cyber System level. Consider removing R5.1 or reworking so it is applicable at the BES Cyber System level. Basin Electric is concerned R5.1 will necessitate maintaining a list of low BES Cyber Systems and possibly a list of low BES Cyber Assets. Basin Electric suggests modifying the requirement to include clarification of when the obligation starts. Perhaps add language to the front of R5 such as: "For assets containing low impact BES Cyber Systems in production…"

The industry and previous drafting teams approved the concept that all standards that impact low impact asset be contained in CIP-003. Recommend moving CIP-013 R5 to CIP-003 R1.2 and if applicable, R1.1. R5 will be the only low impact specific requirement not to be in CIP-003.

Concerned that in R5.2 the term “controlling” is not defined and is not consistent with the High/Medium language in R4. As an implementation of operational controls, R5 needs to be a process not a policy. If this is a process, then recommend removing “controlling”

CIP-013 R5 duplicates CIP-003 R2, which could result in the potential for multiple violations. CIP-013 R1.2.6 covers a policy while CIP-013 R5 is more of a plan

We are concerned that this requirement requires vendor cooperation or else it may not be possible to verify the integrity or authenticity of software and firmware provided by the vendor. Vendors do not fall under the jurisdiction of NERC.

- Request “per system capability” wording for R5. Not all vendors provide a “golden hash” or other mechanism to validate.
- To be consistent with not requiring R1.2.5, we suggest adding the language “subject to procurement contract.”

Does R5 allow the Entity to “accept the risk?”

R5.2 should be revised to say, “Ability to disable or otherwise respond to detected unauthorized activity during remote access sessions.”

Language of R5 should say "…shall document and implement one or more cyber security policies…" to clarify that implementation is expected for compliance. Draft R5 language does not include the term "implement".

As we reviewed Requirement R3 and Requirement R4, it is our understanding that a Management Plan needs to be developed and maintained. However, Requirement R5 is requiring security policies. At this point, we feel that there are inconsistencies in the Requirement language as well as potential Compliance Enforcement issues in reference to those particular Requirements. We would ask the drafting team to provide clarity on why Requirement R3 and Requirement R4 mentions Management Plans and Requirement R5 mentions security policies.

Additionally, the proposed language in Requirement R3 and Requirement R4 mentions high and medium Impact BES Cyber Systems. Requirement R5 mentions Low Impact BES Cyber Systems. Again, we would ask for clarity on why all three (3) Cyber Systems type aren't included in Requirement R3 through Requirement R5?

Finally, we suggest revising Requirement R5 language and moving it to the CIP-003 Standard. In the case that the drafting team doesn't agree with the revising of the Requirement's language, Our group recommends that this Requirement language be moved to the CIP-003 Standard because, we feel that it's the most appropriate Standard to handle this Requirement which is applicable to Low Impact BES Cyber Systems.

Answer	No
Document Name	

Comment
We agree with EEI's recommendation to delete R5. Part 5.2 is duplicative with CIP-003-7, Attachment 1, Sections 2 and 3. Extending the operational controls for authenticity/integrity in Part 5.1 to low impact BES Cyber Systems is not commensurate with the risk. If the SDT thinks the risk to low impact BES Cyber Systems is significant, we encourage them to articulate this risk and how it outweighs the compliance burden created in addressing the massive scope of these low impact systems. NERC's Compliance Registry Summary of Unique Entities and Functions as of March 3, 2017, identifies 1,398 unique NERC entities. These entities range from entities with a couple breakers for low impact Facilities (lines), to entities operating gigawatts of low impact generation units to entities operating high-impact Control Centers for thousands of miles of medium impact Transmission Facilities, for example. All have BES Cyber Assets, but very different risks.

Sean Bodkin - Dominion - Dominion Resources, Inc. - 6

Answer	No
Document Name	

Comment

- Dominion is of the opinion that all CIP policy requirements should be located in CIP-003 and that all requirements for low impact BES cyber assets should be placed in Attachment 1 of CIP-003. Placing all of the low risk operational CIP requirements in a single standard allows entities that have only low impact cyber assets to reference a single source for pertinent requirements.

- Dominion recommends the following modification to Part 5.1:

5.1: Verify the integrity and authenticity of software and firmware and any patches, updates, and upgrades to software and firmware prior to authorized installation into a low impact BES Cyber System."

- Dominion recommends the removal of Part 5.2. Access control obligations, including system-to-system remote access already exist in Section 3 of Attachments 1 and 2 of CIP-003-7 for low impact. CIP-003-7 is currently pending FERC approval.

Comment

With the applicability of low impact BES Cyber Systems, this appears to negate a comment in CIP-002, R1.3 where it states, "… (a discrete list of low impact BES Cyber Systems is not required)".

What is the timing of R5.1 in terms of new software and existing software? The rationale explains that this starts in the operate/maintain phase of the life cycle but does the timing/life cycle language need to be added to the Standard rather than explained in the rationale section, which may not appear in the final language? Does this apply only to devices in production? For example, what if software is pre-loaded by an OEM. Is there an expectation that the Regional Entities work with their OEM to verify integrity and authenticity prior to this pre-loading? We seek more clarity in the language of R5 and recommend adding "…for Cyber Assets in production."

Regarding the security controls for vendor initiated and system-to-system remote access, R5 is about one or more documented policies and R4 is about the processes for authorization, logging and monitoring, and de-provisioning of remote access. With the requirement of one or more

documented cyber security policy, how would Responsible Entities enforce the policy(ies) without also requiring documented plan(s) and process(es), which R5 does not address?

There is no need to have R5 because coverage of low impact BCS is already included in R1. There are two options for R5: integrate it into either (1) existing applicable NERC CIP Standards or (2) R2, R3, and R4 of CIP-013-1.

For option #2:

R2 is about the periodic review and approval of the supply chain cyber security plan(s) developed in R1. R3 obligates Entities to define process(es) to verify the baseline components and any upgrades prior to BCS installation. Requirement R5.1 appears to be identical to R3 because the term "software" in R5.1 is broad in scope and includes the OS and commercially available or open source software.

If Entities are concerned with R4.2 for low impact BCS, the integration of R5 and R4 can either include (1) "per Cyber Asset capability" or "if technically feasible" language for low impact devices or (2) specific language of a risk-based approach, vendor or system, in determining where remote access controls will be applied.

We recommend option #1, the removal of R5 from CIP-013-1 and integration of the requirement into existing applicable NERC CIP Standards.

Comment	

R5 discusses a Low policy – NRG recommends that this requirement should be moved to the CIP-003-7i standard where all CIP policy requirements are outlined.

As we reviewed the Requirements applicable to Requirement R3 and Requirement R4, it is to our understanding that a Management Plan needs to be developed and maintained. However, Requirement R5 is requiring security policies. At this point, we feel that this creates inconsistencies in the Standard language as well as potential Compliance Enforcement issues in reference to those particular Requirements (jumping from plans to a policy).

For SDT consideration, there is no access control requirement today for Low Impact Interactive Remote Access which expands the scope broadly to existing CIP standards. This is a similar concern for patching updates (patch management) for Low Impact BCS.

NRG is concerned that in R5.2 the term “controlling” implies operational and technical controls which is inconsistent with a policy level requirement.

Comment	

The industry and previous drafting teams approved the concept that all standards that impact low impact asset be contained in CIP-003. Recommend moving CIP-013 R5 to CIP-003 R1.2 and if applicable, R1.1.

If the intent of R5 is the same as R3/R4 for the High/Medium then R5 should require “one or more documented processes” and not a policy.

Request clarification. To be the consistent with the policies approval in CIP-003 R1, then only the CIP Senior Manager can approve (not a delegate). Is this the SDT’s intent?

R5.1 is not consistent with R1.2.5. Recommend changing R5.1 from “Integrity and authenticity of software and firmware and any patches, updates, and upgrades to software and firmware; and“ to “Integrity and authenticity of software and firmware and any patches, updates, and upgrades to software and firmware that are intended for use; and” As written R5.1 expands the scope or R1.2.5 with little increase to security or reliability

Concerned that in R5.2 the term “controlling” is not defined and is not consistent with the High/Medium language in R4. As an implementation of operational controls, R5 needs to be a process not a policy. If this is a process, then recommend removing “controlling”

Request that R5 be re-worded to mitigate risk like CIP-003 --- “organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.”

CIP-013 R5 duplicates CIP-003 R2, which could result in the potential for multiple violations. CIP-013 R1.2.6 covers a policy while CIP-013 R5 is more of a plan

We are concerned that this requirement requires vendor cooperation or else it may not be possible to verify the integrity or authenticity of software and firmware provided by the vendor. Vendors do not fall under the jurisdiction of NERC.

- Request “per system capability” wording for R5. Not all vendors provide a “golden hash” or other mechanism to validate.
- To be consistent with not requiring R1.2.5, we suggest adding the language “subject to procurement contract.”

9. Does R5 allow the Entity to “accept the risk?”

10. R5.2 should be revised to say, “Ability to disable or otherwise respond to detected unauthorized activity during remote access sessions.”

11. Language of R5 should say “…shall document and implement one or more cyber security policies…” to clarify that implementation is expected for compliance. Draft R5 language does not include the term “implement”.

R5 modifies requirements for the Cyber Security Policy, in conflict with CIP-003 R1. It also modifies the approval level required for a Cyber Security Policy (Senior Manager ONLY), allowing a delegate to approve part but not all of a Cyber Security Policy. The entire requirement belongs in CIP-003 and should be reworded to not undermine the governance structure set out in CIP-003 and the authority of the CIP Senior Manager.

CenterPoint Energy recommends that the SDT consider moving the portion of this requirement that is not duplicative to CIP-003 with the rest of the requirements for assets that contain Low Impact BES Cyber Systems.

CIP-003-6 R1.2 prescribes policy level controls. CIP-013-1 R5 effectively expands the requirements for policy beyond what is mandated in the current approved and enforceable version of the CIP-003-6 Reliability Standard. Any expansion in scope to CIP-related policy requirements or controls for low impact BES Cyber Systems as defined in the currently approved and enforceable Standard should be subject to the Standards Authorization Request, Development, Commenting, and Balloting Processes so as not to be effectively revising an existing approved and enforceable Reliability Standard through the creation of a separate one.

CIP-003-6 R2 requires registered Entities to develop and implement plans for the control of electronic access (which includes remote vendor-initiated user or system-to-system access) thereby rendering CIP-013-1 R5.2 superfluous and unnecessary, as well as placing it at odds with efforts associated to the FERC filing of proposed retired standards for Project 2013-02 Paragraph 81, and the intent to eliminate duplicative or unnecessary requirements that do not provide security or reliability value.

CIP-003-6 R2 Attachment 1 Section 2 necessitates the implementation of electronic controls for low impact BES Cyber Systems in accordance with the plans developed pursuant to CIP-003-6 R2, thereby further rendering CIP-013-1 R5.2 superfluous and unnecessary, as well as placing it at odds with efforts associated to the FERC filing of proposed retired standards for Project 2013-02 Paragraph 81, and the intent to eliminate duplicative or unnecessary requirements that do not provide security or reliability value.

CIP-002-5 Requirement 1 R1.3 explicitly excludes the requirement for an inventory of low impact BES Cyber Assets through the its parenthetic clause stating, "**a discrete list of low impact BES Cyber Systems is not required**" and CIP-013-1 R5.1 effectively expands this current approved and enforceable requirement through its detailed Cyber Asset-level expectation related to software and firmware and any patches, updates, and upgrades to software and firmware. Any expansion in scope to policy requirements or controls for low impact BES Cyber Systems as defined in the currently approved and enforceable Standard should be subject to the Standards Authorization Request, Development,

Commenting, and Balloting Processes so as not to be effectively revising an existing approved and enforceable Reliability Standard through the creation of a separate one.

1. Supply chain risks may include insertion of counterfeits, unauthorized production, tampering and theft, insertion of malicious software and hardware, as well as poor manufacturing and development practices in the industrial supply chain. Threats and vulnerabilities created by malicious actors (individuals, organizations, or nation states) are often especially sophisticated and difficult to detect, and thus provide a significant risk to organizations. It is difficult to understand how a low impact entity will be able to detect these risks and protect themselves against code that they have no control over. ACES recommends an approach that allows the vendors a process to communicate with low impact entities on how their product is secure. The vendor should be the focal point not low impact entities who do not have the resources to interact with multiple vendors constantly.

Comment	

Though each of the objectives in Order 829 is addressed, Reclamation recommends a more simplified format for the requirements as the SDT originally suggested in the webinar on November 10, 2016.

Reclamation recommends that Requirement R5 be deleted. There would be no need for Requirement R5 if all aspects of the supply chain risk management plan(s) are to be addressed in Requirement R1 and its sub-requirements.

Rationale for Requirement R5:

The rationale language for R5 states, “An entity could apply process(es) used for Requirements R3 and R4 to satisfy its obligations in Requirement R5.” IPC does not see this language reflected in the R5 requirement language. If documented processes are an acceptable means of achieving compliance with R5, IPC suggests rewriting the R5 requirement language to include the terms “processes” or “policies.” Additionally, there is continued creep in the standard language (here and elsewhere) to add requirements for Low Impact BCS, when Responsible Entities are still explicitly not required to have an inventory of Low Impact BCS. If it is the intent of the SDT and regulators to continue adding requirements to Low Impact BCS, IPC recommends a re-write of CIP-002-5.1 to ensure that all Low Impact BCS are appropriately identified rather than using standards to disagree with current enforceable standard language.

R5

The language of R5, R5.1, and R5.2 state, "Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BES Cyber Systems shall have one or more documented cyber security policies, which shall be reviewed and approved by the CIP Senior Manager or delegate at least once every 15 calendar months, that address the following topics for its low impact BES Cyber Systems: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

"**5.1.** Integrity and authenticity of software and firmware and any patches, updates, and upgrades to software and firmware; and

"**5.2.** Controlling vendor-initiated remote access, including system-to-system remote access with vendor(s)."

IPC does not feel CIP-013-1 is an appropriate standard to address R5, R5.1, and R5.2. IPC believe R5, R5.1 and R5.2 belong in CIP-003-7(i), as R5, R5.1, and R5.2 are related to cyber security policies and low impact BES Cyber System requirements. IPC feels the intent of CIP-013-1 is to address supply chain controls, whereas CIP-003-7(i) addresses cyber security policies (High, Medium and Low) and all low impact BES Cyber System requirements.

IPC feels the requirement to have a policy reviewed by the CIP Senior Manager or delegate is purely administrative and does not provide value and recommends that it should be removed.

Comment	
1) The industry and previous drafting teams approved the concept that all standards that impact low impact asset be contained in CIP-003. Recommend moving CIP-013 R5 to CIP-003. 2) R5.1 is not consistent with R1.2.5, should R5.1 include the term “that are intended for use” to read “Integrity and authenticity of software and firmware and any patches, updates, and upgrades to software and firmware that are intended for use; and” 3) Concerned that in R5.2 the term “controlling” is not defined and is not consistent with the High/Medium language in R4. As an implementation of operational controls R5 needs to be a process not a policy. If this is a policy, then suggest removing “controlling” 4) There should be exclusion comparable to a CIP Exceptional Circumstance added to this requirement for situations where the vendor does not cooperate or is otherwise unavailable. 5) R5 should be a plan document and not a policy document.

R1 and R2 are sufficient for addressing vendor risk for LIBCS. Requirements R1 and R2 require Responsible Entities to assess and evaluate ways to mitigate vendor risk. These requirements include LIBCS in addition to MIBCS and HIBCS. We do not believe that extending the operational controls (i.e., authenticity/integrity and remote access) to LIBCS is commensurate with the risk. If the SDT thinks the risk to LIBCS is significant, we encourage them to articulate this risk and how it outweighs the compliance burden created in addressing tens of thousands of LIBCS systems. Also, given the complications we raised above regarding compliance with these operational controls for HIBCS and MIBCS, we recommend that the SDT consider deleting R5.	

We also note that vendor-based and equipment-based approaches that may be adopted for Requirements R3 and R4 are also likely to further address LIBCS. And part 5.2 is also duplicative with CIP-003-7, Attachment 1, Sections 2 and 3. We recommend that the SDT consider deleting Requirement R5.

We strongly disagree with requirement R5. The issues with this requirement are too many to list. In particular the SDT should avoid developing mandatory requirements that will reduce the security and reliability of the Bulk Electric System as it has proposed in this instance. The directive in FERC Order 829 is limited to "the context of addressing supply chain management risks." According to the definition of supply chain provided in NIST-800-53 (and referenced by FERC in paragraph 32, footnote 61), supply chain ends at the "delivery of products and services to the acquirer." In the system lifecycle, the supply chain management process occurs prior to the identification of a Cyber Asset as a BES Cyber System pursuant to the implementation of CIP-002-5.1a. This designation must only occur "upon commissioning" for planned system installations (and even later for unplanned changes). Therefore, this BES Cyber System identification, nor its categorization as low impact, does not exist during the supply chain context. Further, no list of low impact BES Cyber Systems is required. In order to demonstrate compliance with R5, entities would need a list of low impact BES Cyber Systems along with a full system baseline. The net effect of this requirement will be a SIGNIFICANT reduction in security by providing a regulatory disincentive to patch known security vulnerabilities in low impact BES Cyber Systems.

As this Standard is supposed to be focused on the vendor and as supply chain management risks apply equally to all categorizations of BES Cyber Systems, these requirements are superfluous. Requirement R1 already applies to all BES Cyber Systems and includes these requirement elements. There is no reason to call out requirements specific to Low Impact BES Cyber Systems. If the elements of the plans and processes are vendor-focused as they should be, there is no need to itemize the Low Impact BES Cyber Systems, which is the apparent real reason for Requirement R5 being defined separately.

1) The industry and previous drafting teams approved the concept that all standards that impact low impact asset be contained in CIP-003. Recommend moving CIP-013 R5 to CIP-003 R1.2 and if applicable, R1.1.

2) If the intent of R5 is the same as R3/R4 for the High/Medium then R5 should require “one or more documented processes” and not a policy.

3) Request clarification. To be the consistent with the policies approval in CIP-003 R1, then only the CIP Senior Manager can approve (not a delegate). Is this the SDT’s intent?

4) R5.1 is not consistent with R1.2.5. Recommend changing R5.1 from “Integrity and authenticity of software and firmware and any patches, updates, and upgrades to software and firmware; and“ to “Integrity and authenticity of software and firmware and any patches, updates, and upgrades to software and firmware that are intended for use; and” As written R5.1 expands the scope or R1.2.5 with little increase to security or reliability

5) Concerned that in R5.2 the term “controlling” is not defined and is not consistent with the High/Medium language in R4. As an implementation of operational controls, R5 needs to be a process not a policy. If this is a process, then recommend removing “controlling”

6) Request that R5 be re-worded to mitigate risk like CIP-003 --- “organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.”

7) CIP-013 R5 duplicates CIP-003 R2, which could result in the potential for multiple violations. CIP-013 R1.2.6 covers a policy while CIP-013 R5 is more of a plan

We are concerned that this requirement requires vendor cooperation or else it may not be possible to verify the integrity or authenticity of software and firmware provided by the vendor. Vendors do not fall under the jurisdiction of NERC.

· Request “per system capability” wording for R5. Not all vendors provide a “golden hash” or other mechanism to validate.

· To be consistent with not requiring R1.2.5, we suggest adding the language “subject to procurement contract.”

Does R5 allow the Entity to “accept the risk?”

R5.2 should be revised to say, “Ability to disable or otherwise respond to detected unauthorized activity during remote access sessions.”

Language of R5 should say “…shall document and implement one or more cyber security policies…” to clarify that implementation is expected for compliance. Draft R5 language does not include the term “implement”.

This requirement implies larger burdens on Low Impact BES Cyber Systems than the upcoming CIP-003-7 changes in regards to patch management and tracking. In neither of the previous versions of CIP-003, was it deemed necessary for patch management controls to be applied to Low Impact BCS. The nonvariable nature of the phrase "…and **any** patches, updates, and upgrades…" states that the Policies implemented to address this requirement will require a validation on every asset with a Low Impact rating. We recommend removing this Requirement and addressing the FERC Directive solely through R1.

As currently written, R1 and R5 are applicable to low impact BES Cyber Systems. R5 requires "one or more documented cyber security policies" while R1 requires "one or more documented supply chain risk management plan(s)". CIP-003 requires first a policy and then a plan. Policies are typically higher level documents than plans so consistency is an issue here. R5 is duplicative of the review and approval by CIP Senior Manager required in R2. For consistency with other CIP Standards, CIP-003 R1.1 should be expanded to include supply chain risk management as part of the collective cyber security policies to be reviewed and approved by the CIP Sr. Manager at least every 15 months and removed from CIP-013-1.	

R5.1 indicates a protection that needs to be applied at the Cyber Asset level, yet R5 is applicable to BES Cyber Systems. This language elevates low impact BES Cyber Systems to the level of medium and high impact BES Cyber Systems. Under existing CIP Standards, Security Patch Management requirements reside in CIP-007 and none are applicable to low impact BES Cyber Systems. Additionally, software and patching typically occurs at the Cyber Asset level and low impact entities are only required to identify assets containing low impact BES Cyber Systems. Implementing R5 applies controls from existing CIP Standards which are not applicable to low impact BES Cyber Systems. It is incongruous to require verification of patches on a low impact BES Cyber System for which there is no requirement to patch. For consistency purposes, this requirement should be placed within the security plan under CIP-003 Attachment 1 for low impact BES Cyber Systems. Current standards have been drafted to allow entities with low impact BES Cyber Systems to have a single place to for security plan requirements.

- Regarding R5.1, the Standard Drafting Team should clarify what is intended by “[I]ntegrity and authenticity.” This is an ambiguous term which can have different meanings. - Regarding R5.1, vendor information is proprietary (contractually). Registered Entities should not be held accountable for compliance obligations in which they have no control of. - Requirements pertaining to BES Low Impact Cyber Systems should be placed within CIP-003 Attachment 1 as originally intended.

As drafted, R5 greatly increases the requirements for low impact BES Cyber Systems and completely ignores the H/M/L impact model. We feel there should be no such requirements for assets deemed to have a low impact on the BES, and that R5 should be struck entirely. If the SDT disagrees, then please clarify how implementation of these requirements would differ for low impact versus a medium or high impact system?

In addition, Tri-State is struggling to see how implementation of this requirement could be accomplished without a maintained inventory of low impact BES Cyber Systems, vendors, and software. This would be an incredibly substantial effort, that we believe the previous V5 drafting team understood well, which is why entities are not required to have a list of low impact BES Cyber Systems. Please clarify how an entity would carry out such policies while keeping with a low risk model.

This requirement should be eliminated in its entirety. We have adequate cyber controls in place for low impact Cyber Systems. The classification recognizes that these systems inherently have a low ability to negatively impact the Bulk Electric System. We should focus our resources on those systems that have the potential for significant adverse impact on the BES.

Comment	
As with other comments, this requirement is duplicative and should be placed within the security plan under CIP-003 Attachment 1 for low impact BES Cyber Systems. Current standards have been drafted to allow entities with low impact BES Cyber Systems to refer to a single standard to for security plan requirements.

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company	
Answer	No
Document Name	
Comment	

Southern Company disagrees with the direction the proposed R5 requirement is taking, specifically with regard to the implied requirement to have a system baseline inventory of software and/or firmware on each Low Impact BES Cyber System when such an inventory is explicitly not required by existing CIP Standards. Not only does this create a collision of Standard requirements, but the burden on Responsible Entities would be immense and unmanageable – significantly increasing risk to reliability. Despite interpretation of language in this FERC Order, previous commission Orders have supported not requiring inventories at the Low Impact level. Southern recommends the comments previously provided under R1 to properly scope this Standard to "industrial control system" vendor products and services, within the Supply Chain horizon, where risk to assets containing Low Impact BES Cyber Systems is more appropriately addressed.

If the SDT chooses to keep R5 in the Standard in this manner, Southern provides the below edits to more appropriately scope this requirement towards the ICS vendor products at "assets containing lows." Again, consideration must be given to modifying this requirement language in a manner that does not introduce an implied responsibility to maintain an inventory of Low Impact BES Cyber Systems, their member Cyber Assets, and/or the individual component software and firmware baselines of those System components.

For example, if an entity has a thousand or more substations, it does not require a device level inventory of all devices in all substations to know the few vendors of relays that would be in those substations. Therefore, the entity would need to document how they deal with the firmware upgrades for those vendors. The same goes for generating plants; the entity does not need to know the thousands of individual devices in a plant to know the DCS or turbine control vendors per unit. Therefore, having plans and controls for dealing with the software, services, and remote access for those vendors is what is needed.

Additionally, Southern Company disagrees with the placement of this requirement, should it remain in this Standard, recognizing the SDTs time constraints with having to file a new or modified Standard addressing Supply Chain cyber security risks as per the FERC Order. Any requirement addressing controls for assets containing Low Impact BES Cyber Systems should be placed in CIP-003-6 R2, Attachment 1.

Modify R5 language as follows:

R5. Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BES Cyber Systems shall have one or more documented cyber security policies, which shall be reviewed and approved by the CIP Senior Manager or delegate at least once every 15 calendar months, that address the following topics, based on risk, for its industrial control system vendor products and services at assets containing low impact BES Cyber Systems: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

5.1. Integrity and authenticity of software and firmware and any patches, updates,

and upgrades to software and firmware; and **5.2.** Controlling vendor-initiated remote access, including system-to-system remote access with vendor(s).

While in Agreement with the concept of adding a Requirement for low impact BES Cyber Systems, ACEC does have the following concerns: 1. Part 5.1 requires the Responsible Entity to have one or more cyber security policies for "Integrity and authenticity of software and firmware and any patches, updates, and upgrades to software and firmware." This requirement is not consistent with CIP-002-5.1 which states in Requirement 1, Part 1.3 that "a discrete list of low impact BES Cyber Systems is not required." To be able to track security patches and firmware upgrades you will by necessity have to have a discrete list. It is recommended that Part 5.1 be replaced with the Information	

system planning security controls: this will ensure that security will be part of the planning for low impact Information Systems/Control Systems. 2. Part 5.2 requires the Responsible Entity to have one or more cyber security policies for "Controlling vendor-initiated remote access, including system-to-system remote access with vendor(s)." At present, CIP-003-6 Attachment 1, Section 3 requires only that you (3.1) "For LERC, if any, implement a LEAP to permit only necessary inbound and outbound bi-directional routable protocol access;" and "Implement authentication for all Dial-up Connectivity, if any, that provides access to low impact BES Cyber Systems, per Cyber Asset capability." This new Requirement extends these controls significantly beyond the present CIP-003-6 requirement and should be replaced with the Vendor risk management and procurement security controls: this will ensure that these issues are addressed early in the procurement process and throughout the lifecycle of low impact BES Cyber Systems and their associated Cyber Assets. 3. This Requirement should be moved to CIP-003-6, where ALL low impact BCS Cyber Systems security controls are addressed. This will allow Registered Entities with only low impact BES Cyber Systems to address only CIP-002-5.1 and CIP-003-6, reducing the potential for confusion. This approach has been taken by SDT 2016-02 in adding Transient Cyber Assets/Removable Media requirements to CIP 003-6 vice including in CIP-010-2 where it is addressed for high and medium impact BES Cyber Systems.

In the VSL for Requirement R5 there is no recognition of a Responsible Entity that had cyber security policies specified in the requirement that were reviewed and approved by the CIP Senior Manager or delegate, but the approval was more than 18 calendar months. A third entry should be added to the Severe VSL for Requirement that reads:

The Responsible Entity had cyber security policies specified in the requirement that were reviewed and approved by the CIP Senior Manager or delegate, however, the approval was more than 18 calendar months from the previous review.

Sheranee Nedd - Public Service Enterprise Group, Public Service Electric & Gas, PSEG Fossil LLC, PSEG Energy Resources & Trade LLC - 1,3,5,6 - NPCC,RF, Group Name PSEG REs	
Answer	Yes
Document Name	
Comment	
PSEG agrees with the intent of this requirement, but has the following questions/recommendations below: • Recommend moving CIP-013 R5 to CIP-003 R1.2, to remain consistent with previous decisions to maintain all low impact requirements in CIP-003. • Request clarification. Requirement R5 requires one or more documented policies. The Rationale for Requirement R5 states "An entity could apply process(es) used for Requirement R3 and R4 to satisfy its obligations in Requirement R5 or could develop a separate policy or processes to address low impact BES Cyber Systems." Is the intent of R5 similar to R3/R4 that the outcome is "one or more documented processes"? If so, should there be a separate policy requirement added to CIP-003 to have the CIP Senior Manager approve the policy?

6. Do you agree with the Implementation Plan for proposed CIP-013-1? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan provide your recommendation and explanation.

Summary Consideration. The SDT thanks all commenters. The SDT has revised the Implementation Plan from 12 months to 18 months for CIP-013-1 in response to comments for longer implementation period. The SDT is proposing the same period for proposed CIP-005-6 and CIP-010-3. The SDT believes the revised Implementation Plan provides Responsible Entities with the necessary time to meet the requirements and will achieve the reliability objectives with due urgency.

Answer	No
Document Name	
Comment	

In light of the sweeping changes represented by CIP-013, potentially altering the way an entire industry assesses risk, deals with vendors and contractors, and performs security operations tasks, the 1 year after FERC approval effective dates are far too short for implementation. CenterPoint Energy would like to propose an effective date of at least 24 months following FERC approval. It will be a significant effort for entities to write a plan, negotiate with vendors, train and work with new groups to implement the requirements.

1) R3/R4 implementation seems to make existing contracts applicable on the effective date of the Standard. Implementation of R3 would need to be done using the CIP-010 Cyber Security – Configuration Change Management process for managing changes to the baseline. A 24-month process would be needed for larger entities to manage this process on all impacted systems. 2) Suggest breaking the implementation into three steps, which follows CIP-014 – Entity to a) identify risk, b) develop a plan, c) implement controls for contracts initiated after enforcement date and subsequent plan revisions. 3) Request clarification. The language in the Implementation - General Consideration refers to “contracts with vendors, suppliers or other entities “however, the Standard only refers to vendors. The Rationale for R1 defines vendors but not “suppliers or other entities.”

Julie Hall - Entergy - 6, Group Name Entergy/NERC Compliance	
Answer	No
Document Name	
Comment	

Entergy seeks clarification on if the implementation date for CIP-013 merely requires that the entity have a CIP supply chain management plan in effect (with the ability to have a rolling implementation of specific protections and controls directed in that plan similar to the CIP-014 implementation), or if all protections and controls directed in the plan (including the potential technical deployment of new devices/systems) must be installed and live on day one of the implementation date. In other words, Entergy notes that the proposed standard recognizes and allows for a multi-phased, or rolling, implementation of the CIP supply chain management plan by not requiring contracts be renegotiated to adopt new terms and conditions; Entergy requests that CIP-013 explicitly allow entities to likewise have a phased or rolling implementation of identified controls and protections measures identified in their security plans after the implementation date.

In the alternative, Entergy cannot support the "12 month" implementation plan and recommends the date be no less than 18 months until more certainty on the extent of technical deployments required by the Standard can be provided. For example, until more clarity is given regarding whether implementation of existing CIP-005 and CIP-007 controls will adequately meet compliance with CIP-013 R4 and R5, or regarding the definition of "vendor remote access." This is because, depending on the date of passage, the 12 month implementation requirement may fall outside of an entity's capital planning and budgeting process, resulting in considerable constraints in acquiring funds for significant capital investment to achieve compliance with the standard.

Accordingly, Entergy requests that either a phased or rolling implementation be explicitly approved, or the implementation date be no less than 18 months.

Kara Douglas - NRG - NRG Energy, Inc. - 3,4,5,6 - FRCC,MRO,WECC,Texas RE,NPCC,SERC,SPP RE,RF	
Answer	No
Document Name	
Comment	

In the implementation plan for this standard, NRG recommends a staggered implementation plan for R1, R2, & R5 being 15 calendar months. However, NRG recommends a 24-month implementation plan for R3 & R4would be needed for Registered Entities to manage this process on all impacted systems due to the need to re-negotiate processes with vendors (individualized solutions).

The implementation plan should have a timeline for compliance for initial enforcement and subsequent plan revisions – similar to CIP-002 with planned and unplanned changes.

In reference to R1 and contracts, we suggest that the term "future contracts" be addressed in the requirement language such as: "new or modified contracts" on or after the date of Enforcement. These should be vetted in an implementation plan. There will be a conversation of initial compliance versus implemented/ongoing compliance; therefore, NRG requests clear understanding of the implementation plan scope as it pertains to plan reviews, new contracts, modified contracts, and current contracts.

Sean Bodkin - Dominion - Dominion Resources, Inc. - 6	
Answer	No
Document Name	
Comment	

- Under General Considerations, additional language should be added to address existing contract extensions or addendums, effectively excluding them as well.

For the implementation plan which is 12 months, Dominion recommends an 18 month implementation period for the following reasons:

- Time is needed for entities to assess and impacted contracts relevant to applicable BES Cyber Assets.
- Budgets cycles often extend beyond a 12 month timeframe.
- New environments and assets may be in scope.
- This revision necessitate that entities conduct an impact assessment to determine what changes the revisions create and what is currently in place from the assessments performed for CIP version 6 implementation for low impact BES Cyber System.
- Revision iterations always require some time to assess and verify points of change.

We do not support the implementation plan based on the proposed changes recommended in approach to addressing the directives. The implementation plan has to be revised to reflect a revised approach. Implementation of operational cyber security controls changes to standards CIP-002 through -011 should provide for at least two years, especially because of the time it may take some entities if they have to completely revise how their vendors are currently providing service to them.

William Harris - Foundation for Resilient Societies - 8	
Answer	No
Document Name	
Comment	
Resilient Societies recommends a strategic reassessment of how NERC should, in good faith, respond to FERC Order No. 829. Many of the cost-effective remedial initiatives will be beyond the control of the North American electric utilities industry. Fundamental changes in the procurement of IT and OT systems will be required. Also, there are promising cross-industry initiatives to develop Open Source Codes that will better protect industrial control systems and other control systems upon which the electric utility industry depends. NERC should partici;pate in these ongoing initiatives. CIP-01301 imposes too large a burden on roughly 1400 electric utilities within the bulk electric system.	

Moreover, the Secretary of Energy has recently-granted (FAST Act) cyber security authority for the broader energy sector. Vulnerabilities of transmission and distribution utilities beyond FERC regulatory authority will foreseeably be channels through which foreign adversaries can attack the bulk electric system includng those portions that are subject to NERC-FERC standards. A broader framework is needed. The current draft Reliability Standard CIP-013-1 imposes substantial costs in time and money, and will not be a cost-effective initiative. We respectfully urge NERC to provide fresh guidance to the Standard Drafting team to link proposed reliability requirements to broader initiatives, includng the Defense Science Board Report of February 2017 and findings of the Trump Administratioon as it reviews cyber strategy and policy initiatives.This standard will be wasteful of resources, and is not ready for prime time.

The implementation plan identifies that the effective date will be at least 12 months after the effective date of the applicable governmental authority's order approving the standard or 12 months after the date the standard is adopted by the NERC Board of Trustees where approval by an applicable governmental authority is not required. Extending the initial review and update, as necessary, of cyber security risk management plans specified in Requirement R2 by as much as 15 months after the effective date of the standard seems to extend the improved supply chain risk management unnecessarily. PGAE believes the initial review and approval of the cyber security risk management plans specified in R2 should be completed on or before the effective date, so that subsequent Requests for Proposal and/or vendor contracts and applicable Service Level Agreements after the effective date can incorporate the R1 controls.

AE does not agree that a 12-month implementation plan is sufficient. For example, if processes for verifying integrity and authenticity are to be implemented for each individual vendor, that could be an extraordinarily time consuming activity. AE requests a 24-month implementation plan. AE requests clarification on the language that is used to address vendors and suppliers. In the Implementation - General Consideration it refers to "contracts with vendors, suppliers or other entities" however, the Standard only refers to vendors. The Rationale for R1 defines vendors but not "suppliers or other entities."

Duke Energy proposes an alternative Implementation Plan for the drafting team's consideration. We agree with an Implementation Plan of 12 months for R1 and R2, and propose an Implementation Plan of 24 months for R3 and R4. We feel that based on the type of work and the workload that will be necessary to comply with R3 and R4 due to these requiring technical controls and configuration changes, a longer implementation plan is required.

Lack of a NERC definition of a PED makes it uncertain which products this (or any other) CIP standard applies-to. No new CIP standards should be developed until this issue is addressed. One year is not enough time, for the reasons stated above. A minimum of two years should be granted.

12 calendar months may be inadequate if contracts are in the negotiation stage. 18 months may be more realistic; however, this is dependent on the language in the final set of requirements. We also recommend that the SDT consider how best to make it clear that this is a forward-looking standard as it relates to contracts, and the associated nuances. For instance, if you have a contract in place that allows for extensions or amendments, do you have to open up the entire contract when extending, making amendments, or minor revisions?

The Implementation Plan is unfeasible as currently drafted. The proposed Standard should utilize a phased in implementation. In addition, the Standard and Implementation Plan do not address that CIP-013 only addresses new contractual obligations. This lack of clarity will likely cause issues during the enforcement period of the Standard.

The technical controls required by R3/R4/R5 should be given additional time consideration. Perhaps 24 months to allow time to research and deploy technical controls of R3/R4/R5 while R1 – R2 are policy/contract-language driven only. Would a phased implementation approach be acceptable as a lot of the risks in R3, R4 and R5 have already been mitigated in CIP-007 and CIP-005 and therefore a maturity over time may make more sense?

The Standards as currently written require significant modifications to organizational procurement processes for big and small entities alike. Due to the scope of assets being considered, entities must implement central procurement in such a way for every cyber asset to filter through the rigorous process. The number of contracts cutting across BES and non-BES Cyber Systems are too numerous and complex to address as a separate CIP compliance process. This has the potential to require more organizational change than any of the previous version of CIP Cyber Security Standards. In comparison, CIP version 5 implementation allowed for 24 calendar months and fully resourced entities struggled to get the organizational processes perfected in time to meet the deadlines. We propose a minimum of 24 calendar months be allowed for the currently drafted Standard. We feel this is appropriate given the minimal time FERC has permitted for this Standard to be submitted.

1) R3/R4 implementation seems to make existing contracts applicable on the effective date of the Standard. Implementation of R3 would need to be done using the CIP-010 Cyber Security – Configuration Change Management process for managing changes to the baseline. A 24-month process would be needed for larger entities to manage this process on all impacted systems. 2) Suggest breaking the implementation into three steps, which follows CIP-014 – Entity to a) identify risk, b) develop a plan, c) implement controls for contracts initiated after enforcement date and subsequent plan revisions. 3) Request clarification. The language in the Implementation - General Consideration refers to "contracts with vendors, suppliers or other entities "however, the Standard only refers to vendors. The Rationale for R1 defines vendors but not "suppliers or other entities." 4) Implementation Plan refers to "contracts with vendors, suppliers or other entities"; however, Standard refers to only vendors in the text of the Requirements. "Suppliers or other entities" should be removed.

The deferment of R2 by 15 months further supports the idea that the original documents do not have to be approved by the CIP Senior Manager, only subsequent revisions. The Implementation plan should at least require initial approval of the plans that are then subject to periodic review.

GTC disagrees with the implementation plan. The security controls identified will take significant time to implement, particularly as specified for low impact BES Cyber Systems. The suggestion of a 12 month implementation window implies that fundamentally the SDT does not appreciate the volume and diversity of low impact BES Cyber Systems across North America. Additionally, a 12 month implementation window does not allow time for entities to complete an annual budget cycle. As such, we strongly recommend that the SDT considers an 18

month implementation window at minimum. If any controls are kept for low impact, then a minimum 24 month implementation window should be provided for those controls.

Alternatively, GTC recommends the SDT to work with NERC to immediately begin to take the necessary actions to request more time from FERC to satisfy Order 829. This can be accomplished in 2 phases.

For the first phase, GTC believes the 12 month implementation window can be achieved if the SDT would limit the structure of CIP-013-1 to the supply chain context which ends at the delivery of products/services to the acquirer in accordance with NIST SP 800-53 r4 as outlined in GTC comments number 1 and 3.

For the second phase, GTC encourages for NERC to lay out a plan to FERC to better address the operational/technical requirements of R3 and R4 with the applicable existing CIP standards so that the correct technical experts can develop in a manner that would not create the double jeopardy scenarios described under the comments for R4 and R5. NERC could then request a 24 month window to address the operational technical requirements in the correct applicable CIP standard. FERC provides NERC discretion per paragraph 44 the option of modifying existing Reliability Standards to satisfy the directive.

GTC recommends the SDT consider GTC's strategy in the comments above, and adapting the Implementation Plan accordingly.

Under initial performance, replace “of” with “following” so that it reads R2 must be completed within fifteen (15) calendar months following the effective date…”

The general considerations section does not explicitly address contract term extensions or other amendments that would not involve renegotiating the contract. We recommend that the SDT add language to address this concern.

We recommend 18 months rather than 12 so that contracts under negotiation can be included. Incorporation of an 18 month implementation plan is also in line with the changes recently approved by industry for the balance of the CIP Standards currently under modification.

We also recommend that the SDT consider adding text to the requirements that make it clear that this is a forward-looking standard. Currently, this forward-looking information only appears in the implementation plan, which may become hidden or lost over time.

The IRC and SWG are unclear how an entity will comply with requirements in R3, R4, and R5 if contracts have not been renegotiated to address the requirements with vendors. Further, clear criteria needs to be identified to determine when an entity must comply with the requirements. The applicability of the Standard should be clarified to address cyber assets procured prior to the CIP-013 effective date. Concerns to be considered include, (1) upon execution of a new agreement with the vendor, (2) upon installation of any new equipment, or (3) upon installation of any new software? Requiring compliance on new equipment or software will be problematic if the contractual agreements do not align.

The IRC and SWG request a 24-month implementation timeframe for CIP-013 R3 and R4 as budget cycle(s) will be required to support contractual issues, implementation, with possible automation of compliance evidence.

Implementation plan must clearly state that all these requirements are forward looking and should not impact any existing contracts. We also believe that 12 months may not be enough to fully develop and implement a plan for large organizations to meet all four objectives. Perhaps a 24 month implementation period is appropriate. What is the difference between vendors, suppliers or other entities as stated in the implementation plan in the context of supply chain? None are defined terms.

Recommendation for a 24-month implementation process. The implementation for the current CIP-013 standard is short. Many of the systems that are already in place under the current CIP standards were custom created or have features enabled to comply with the requirement(s) which they address. To comply with the standard requirements in CIP-013, in particular R4, registered entities may require modifications to the current processes and systems already in place or may require procurement of new components and/or services. The change process would require coordination with facility/equipment outages. A longer timeframe would be required for entities to effectively manage these changes without a negative impact to BES reliability. Also, to develop a supply chain risk management plan and implement that plan into our contracts would require more than 12 months to implement.

In IPC's opinion, a 12 month effective date is not enough time to implement this standard given the amount of existing CIP standards currently in flux and new standards being developed. In addition, Regulatory guidance is often slow in coming, and entity budgetary cycles are usually at least 12 months. IPC suggests an 18–24 month effective date. An 18-month effective date is also consistent with the CIP-003-7 implementation plan.

It is premature to accept/agree with any implementation plan due to the infancy of this proposed standard and potential risks, impacts, and unintended consequences that may ensue if the CIP-013-1 Standard were to move forward without adequately addressing the concerns of redundancy, lack of clarity, expansion in scope, or contradictory nature of the collective set of proposed requirements as described in above comments. Until the language can be improved so as not to create double jeopardy or an impossibly of non-compliance due to factors outside the control of the Registered Entity, or until a shift in approach can be agreed upon so as to leverage existing enforceable regulations that already provide the intended security or reliability benefit, ATC cannot support the proposed implementation plan.

The proposed 12-month implementation period and specification of an initial performance date for the CIP-013-1, R2 review and update appear reasonable. Texas RE requests the SDT provide a justification for the 12-month implementation period as part of the Standard development process.

In conjunction with the comments provided under R1 above, Southern Company supports the SDTs direction proposed in the Implementation Plan where it is applicable to the Supply Chain time horizon and industrial control system vendor products and services used in BES Cyber Systems, but requests the consideration of an 18 month (rather than 12 month) timeframe. For any requirements applicable to assets containing Low Impact BES Cyber Systems, given the volume and complexity of those assets, as well as the volume and diversity of agreements necessary between the Responsible Entity and it's suppliers of ICS products and services, Southern requests the consideration of a 24 month timeframe for implementation.

Twelve months is not sufficient time to allow compliance with all aspects of this standard. The drafting team should consider a phased approach allowing the logical phased implementation of these requirements. While the Implementation Plan suggests that existing contracts need not be modified, the proposed standard language does not make this clear. ERCOT believes the standard to be a more appropriate location for this exemption, as it is ultimately substantive in nature. ERCOT there recommends that the drafting team include language in the standard explicitly limiting applicability of the requirements to new contracts.

7. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the requirements in proposed CIP-013-1? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs provide your recommendation and explanation.

Summary Consideration. The SDT thanks all commenters. The SDT is not proposing any changes to CIP-013-1 VRFs. The SDT has revised VSLs for clarity and to specify additional levels of compliance, where appropriate.

The VLS for R1	

- The term “Either of the elements specified” in the Sever VLS is implying two elements when in fact I believe you are meaning “Any of the Elements in Either of the two requirement subparts.”
- The High VLS specifies “…did not include one of the elements specified in Parts 1.1 or 1.2”. Since one of these elements 1.2.7 is optional by inclusion of the “if applicable” language, this VLS should be rewritten to specifically exclude 1.2.7.

The VSL for R2

- Reviewing and modifying the plan reduce the risk, having a signature does not. Setting arbitrary times frames surrounding missing dates does not reduce risk. Recommend:

o VSL lower - no signature

o VSL Moderate - missing a new supply chain security risk during the review

o VSL High - not performing review within 15 months

o VSL Sever - not implementing needed control changes as identified from review

VSL for Requirement R3

Requirement R3 has four sub-parts which describe the software and firmware which need to be verified. ReliabilityFirst recommends the SDT structure the VSLs similar to Requirement 1 to address each of the sub-parts. ReliabilityFirst offers the following modifications for consideration

Lower VSL – The Responsible Entity implemented one or more documented process(es) for verifying the integrity and authenticity of the software and firmware but did not verify one of the elements specified in Parts 3.1 through 3.4.

Moderate VSL - The Responsible Entity implemented one or more documented process(es) for verifying the integrity and authenticity of the software and firmware but did not verify two of the elements specified in Parts 3.1 through 3.4.

High VLS – The Responsible Entity implemented one or more documented process(es) for verifying the integrity and authenticity of the software and firmware but did not verify three of the elements specified in Parts 3.1 through 3.4.

Severe VSL - The Responsible Entity did not implement one or more documented process(es) for verifying the integrity and authenticity of software and firmware before being placed in operation on high and medium impact BES Cyber Systems as specified in the Requirement.

VSL for Requirement R5

To account for instances where the Responsible Entity had cyber security policies specified in the requirement but were not reviewed for 18 months or greater, ReliabilityFirst recommends the following “OR” statement be added to the Severe VSL Category: Additional Severe VLS - The Responsible Entity had cyber security policies specified in the requirement that were reviewed and approved by the CIP Senior Manager or delegate, however the approval was more than 18 calendar months from the previous review.

CHPD does not agree with the VSLs that classify a level of non-compliance as a High or Severe. In R2 and R5, CHPD requests that the SDT consider incrementally increasing the VSL for lateness based on a range (0-6 months = Lower, >6 = Moderate) instead of increasing the level of severity by each month late.

For R1, it is unclear what is considered an element of Parts 1.1 and 1.2. The language for Severe uses the language "did not include either element" leading to the conclusion that R1.1 and R1.2 are the only two elements and that missing any one of the sub-requirements could be considered a failure to include the entire element and would result in a High VSL violation, as a minimum. CHPD requests considering all of the nine sub-requirements of R1.1 and R1.2 as separate elements and construct the VSL table to be consistent with CIP-003-6 R1.1 where missing a single element results in a Lower VSL.

For R1. It is unclear what is considered an element of Parts 1.1 and 1.2. The language for Severe uses the language "did not include either element" leading to the conclusion that R1.1 and R1.2 are the only two elements and that missing any one of the sub-requirements could be considered a failure to include the entire element and would result in a High VSL violation, as a minimum. Recommend considering all of the nine sub-requirements of R1.1 and R1.2 as separate elements and construct the VSL table to be consistent with CIP-003-6 R1.1 where missing a single element results in a Lower VSL.

For R3 and R4: It is unclear what the difference is between implementing a process and performing a process that has been implemented. In general, Policies and Plans are implemented while processes are performed. If a Policy or Plan is required to be implemented and there is an instance where a process included as part of the Policy or Plan, is not adhered to, then this would result in a violation of the Policy or Plan but

not in the requirement to implement the Policy or Plan. The requirement to implement a process could result in a High VSL violation for each instance where the procedure was not followed. With this understanding, the single violation of following a process should not result in a Severe VSL. Suggest having the VSL level dependent on the number of failures to implement the process. This is consistent with the implementation of a process in CIP-002 resulting in a VSL level based on the number or percentage of instance the process was not conducted.

Do not agree with the VSLs that classify a level of non-compliance as a High or Severe. In R2 and R5, Suggests that the SDT consider incrementally increasing the VSL for lateness based on a range (0-6 months = Lower, >6 = Moderate) instead of increasing the level of severity by each month late.

WECC believes missing one of the elements of Part 1.2 in the VSL for Requirement R1 should be considered lower risk than missing one of the elements in Part 1.1, as it seems to be a subset of Part 1.1., and should be assessed at moderate risk. WECC agrees that missing one of the elements of Part 1.1 is appropriately identified as a High VSL. In the VSL for Requirement R5 there is no language for a Responsible Entity that had cyber security policies specified in the requirement that were reviewed and approved by the CIP Senior Manager or delegate, but the approval was more than 18 calendar months from the previous review. WECC believes a third entry should be added to the Severe VSL for Requirement that reads:

The Responsible Entity had cyber security policies specified in the requirement that were reviewed and approved by the CIP Senior Manager or delegate, however, the approval was more than 18 calendar months from the previous review. Additionally, in the high and severe VSL language of R5 it appears that the word "but" before the words "did not include" should be deleted.

There is a concern that there is an inconsistency with the risk impact classification for the Requirements, and VSLs. We feel that these inconsistencies have the potential to lead to Compliance Enforcement issues in reference to the proper alignment of both sections. For example, the VSLs for Requirement R3 and Requirement R4 focus on high and medium, however, Requirement R5 mentions low impact. We feel that all three (3) classifications need to be considered in all of the Requirements language to have a successful Standard.

• We recommend that requirements R1 and R2 should be low based on the fact the requirements are administrative in nature (i.e., deal with the procurement), and if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the Emergency, abnormal, or restorative conditions anticipated by the	

preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. • We recommend that requirement R5 should be Low because it is related to CIP-003-6 which is also Low.

There is a concern that there is an inconsistency with what is stated in the Requirements, VRFs, and VSLs. These inconsistencies have the potential to lead to Compliance Enforcement issues in reference to those particular elements of the Standard and therefore, NRG recommends alignment between Requirements, VRFs, and VSLs. NRG suggests that this language be properly aligned with the requirements (recommendation for Low or Moderate VSLs relating to process controls) or else this could lead to future Compliance Enforcement issues for the industry.

The VRFs and VSLs seem harsh. CenterPoint Energy does not agree with the automatic High VSL for any element not fully addressed, in a Regional Entity's opinion, by a Responsible Entity's risk management plan, especially given the extremely vague bounds presented on what represents a valid risk management methodology, planning process, evaluation method, or mitigation effectiveness measure.

OUCX does not agree with the VSLs that classify a level of non-compliance as a High or Severe. In R2 and R5, OUC requests that the SDT consider incrementally increasing the VSL for lateness based on a range (0-6 months = Lower, >6 = Moderate) instead of increasing the level of severity by each month late. For R1, it is unclear what is considered an element of Parts 1.1 and 1.2. The language for Severe uses the language "did not include either element" leading to the conclusion that R1.1 and R1.2 are the only two elements and that missing any one of the sub-requirements could be considered a failure to include the entire element and would result in a High VSL violation, as a minimum. OUC requests considering all of the nine sub-requirements of R1.1 and R1.2 as separate elements and construct the VSL table to be consistent with CIP-003-6 R1.1 where missing a single element results in a Lower VSL.

It is premature to accept/agree with the VRFs or VSLs due to the infancy of this proposed standard and potential risks, impacts, and unintended consequences that may ensue if the CIP-013-1 Standard were to move forward without adequately addressing the concerns of redundancy, lack of clarity, expansion in scope, or contradictory nature of the collective set of proposed requirements as described in above comments. Until the language can be improved so as not to create double jeopardy or an impossibly of non-compliance due to factors outside the control of the Registered Entity, or until a shift in approach can be agreed upon so as to leverage existing enforceable regulations that already provide the intended security or reliability benefit, ATC cannot support the proposed VSLs/VRFs.

1) For R1. It is unclear what is considered an element of Parts 1.1 and 1.2. The language for Severe uses the language "did not include either element" leading to the conclusion that R1.1 and R1.2 are the only two elements and that missing any one of the sub-requirements could be considered a failure to include the entire element and would result in a High VSL violation, as a minimum. Recommend considering all of the nine sub-requirements of R1.1 and R1.2 as separate elements and construct the VSL table to be consistent with CIP-003-6 R1.1 where missing a single element results in a Lower VSL.

2) For R3 and R4: It is unclear what the difference is between implementing a process and performing a process that has been implemented. In general, Policies and Plans are implemented while processes are performed. If a Policy or Plan is required to be implemented and there is an instance where a process included as part of the Policy or Plan, is not adhered to, then this would result in a violation of the Policy or Plan but not in the requirement to implement the Policy or Plan. The requirement to implement a process could result in a High VSL violation for each instance where the procedure was not followed. With this understanding, the single violation of following a process should not result in a Severe VSL. Suggest having the VSL level dependent on the number of failures to implement the process. This is consistent with the implementation of a process in CIP-002 resulting in a VSL level based on the number or percentage of instance the process was not conducted.

3) Do not agree with the VSLs that classify a level of non-compliance as a High or Severe. In R2 and R5, Suggests that the SDT consider incrementally increasing the VSL for lateness based on a range (0-6 months = Lower, >6 = Moderate) instead of increasing the level of severity by each month late.

The VRF mapping based on the ERO Final Blackout Report is questionable because CIP-013 only addresses the possible inclusion of non-authentic or compromised hardware, firmware, and software; and does not speak to the risk level of the inclusion. The same compromised hardware, software, or firmware will pose different risks to the BES based upon the inherent risk to the BES by the Entity. The VSL's are acceptable from a documentation administration standpoint, but do not correspondinly map to the impact resulting. While it is now appropriate to be generating ideas on VRF and VSL for CIP-013, a final determination should wait until the industry is closer to consensus on the actual requirements.

Requirement R2 calls for the periodic review of existing plans and approval of updates. This is mostly a documentation management requirement and the VRF could be defined as Lower instead of Medium. Compromised software integrity is a key element of previous successful cyberattacks, including Havex. The VRF for Requirement R5 needs to be Medium even though the focus of the Requirement is on Low Impact BES Cyber Systems. The Severe VSL for Requirement R1 should refer to failing to include two or more elements of Parts 1.1 or R1.2. While that should be able to be presumed from the lesser applicability of the High VSL for R1, it is not sufficiently clear.

In light of all previous comments made above, Southern Company requests that the SDT also consider the VSLs for R3, which should accommodate other levels of severity with regard to verifying integrity and authenticity of industrial control system vendor products, software, patches, and/or upgrades. As currently written, any violation of R3 is considered Severe. There are more granular levels of severity to be considered, for example – when a Responsible Entity has a plan(s), has implemented that plan(s), but a percentage of a volume of patches applicable to a particular business unit (out of many business units within a Responsible Entity) were not adequately validated.

8. The SDT drafted the *Technical Guidance and Examples* document to provide entities with technical considerations and examples of controls that will aid in implementing proposed CIP-013-1. Provide any comments or suggestions to improve the document, including recommended changes, additions, or deletions, along with technical justification. Include page and line number if applicable.

Summary Consideration. The SDT thanks all commenters. The SDT developed draft Implementation Guidance from the Technical Guidance and Examples document. The SDT's intent is to provide considerations for implementing the requirements in CIP-013-1 and examples of approaches that Responsible Entities could use to meet the requirements. The examples do not constitute the only approach to complying with CIP-013-1. The draft Implementation Guidance is intended to highlight some approaches that the SDT believes would be effective ways to be compliant with the standard, and will be submitted for ERO endorsement as described in NERC's Compliance Guidance Policy.

The Technical Guidance and Examples makes it more evident as to how much of CIP-013 is duplicative of exisiting CIP Standards. CenterPoint Energy strongly recommends that the CIP-013 draft be edited as noted and the Technical Guidance and Examples be revised accordingly.

1) The guidance document is suggestions or recommendations. Request replacing all imperative language such as “should” with discretionally language such as “may”.

2) The term “supplier” is used in the guidance document. Recommend replacing with Vendor or providing clarification on the difference between the two.

3) The Rational sections of CIP-013 standard and the guidance document uses the term “information system”. Recommend replace this with the appropriate NERC defined term: BES Cyber System, Cyber Asset…. Or define the term.

4) Vendor should be a defined term. Suppliers should also be defined. Also, need consistent use of vendor vs third-party. Are sub-component manufacturers included?

5) Page 1, line 37 that starts with “These cyber system cover the scope of assets needed….” to “These Cyber Assets cover the scope needed …” The term “assets” is not defined by NERC but is used in CIP-003 to identify substations and generation assets.

6) Page 2, line 23. The sentence “Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan” should be changed to “Obtaining specific controls in the negotiated contract may not be feasible. In these cases, failure to obtain and implement these controls is not considered a failure to implement an entity's plan.”

7) Page 2, line 32: change “cited to the BlackEnergy” to “Cited the BlackEnergy”.

8) Page 2, line 46: Change this line to be “In the development of the supply chain risk management plan, the responsible entity may consider the following:”. It seems like the bullets listed on page 8 seem to be considered in the development of the supply chain risk management plan and not in the implementation of the plan

9) Page 3: The format that NERC uses for writing standards is that bulleted items are “or” clauses. These bullets should be numbered and not bullets. This is an issue in multiple place in this document.

10) Page 3, line 24: This paragraph is not consistent with the SDT response given during the 2/2/17 webinar when asked what a responsible entity should do when a vendor will not or cannot agree to controls required by this standard. The SDT said, “find another vendor.” Request that the SDT clarify a consistent answer.

11) Page 3, line 32: Please provide clarity to the meaning of the word “mitigate” and the possible expectation that all risks can be mitigated 100%. Would the phrase used on line 39 be better: “mitigating controls to reduce the risk”?

12) Page 4, line 29: The System Development Life Cycle program (SDLC) seems like a defined program. Provide reference to the standard, document or agency that can give details on this.

13) Page 5, line 14: *determine mitigating controls* implies implementation, which is different than the requirement to *evaluate methods*

1) Page 5, line 14: R 1.1 states “The use of controls in planning and development”. This line states “applied in procurement and/or operational phase of product or service acquisition and implementation”. The “and/or operational” phase is an unnecessary modifier for “product or service acquisition and implementation”. It could be interpreted to extend the scope beyond the planning and development cycles. Recommend deleting “and/or operational phase of”.

2) Page 6, line 1. Provide explanation on how the term “vendor” used in the requirements relates to “supplier’s system component, system integrators, or external service providers.”

3) Page 6., line 5. Notification of all “identified, threatened attempt” is too broad for large and highly visible vendors like Microsoft. The scope should be limited to only the identified, successful breaches in the vendor’s security that the vendor determines could have impact on the entities equipment or services associated with BES Cyber Systems. 4) Page 6, line 6: Is the (“Security Event”) being used to define a term that is used not only in this document but in R1.2.1? If so, it should be a NERC Glossary term. If the term is defined by the language here, recommend that ”have potential adverse impacts to the availability or reliability of BES Cyber Systems“ be part of the definition. 5) Page 6, line 22: For R1.2.2: The requirement for the ”process for notification” is very different than the “request vendor cooperation” guidance given. Request clarification as to how this guidance for “requested cooperation” would meet the required “notification”. 6) Page 9 lines 6 and 8: correct numbers “2.2” and “2.3” to be “2.1” and “2.2”. 7) Page 11, Line 15, replace supplier with Vendor. 8) Page 11, line 25, replace “should” with “may” 9) Page 12, line 3-9 italicize to be consistent with other areas of this guidance when the Requirements are quoted. 10) Page 12 line 13. Vectren understands the SDT is working on separating the Technical Guidance and Examples document into a Guidance and Technical Basis document and an Implementation Guide. Below are comments regarding the current document. **R1** R1.2.2 -- • Request vendor cooperation to obtain Responsible Entity notification of any identified, threatened, attempted or successful breach of vendor's components, software or systems ("Security Event") that have potential adverse impacts to the availability or reliability of BES Cyber Systems. How does a vendor security event affect the availability or reliability of the BES Cyber Systems?	

1.2.3 – Technical Guidance & Examples states that for the duration of the relationship with the vendor cooperation in access to documentation regarding identified security breaches. Standard states R1 and R2 are for the procurement (and deployment) of products, not the operate/maintain portion of the life cycle. 1.2.4 – same concern of how does a security event with an adverse impact to the availability or reliability of BES Cyber Systems require vendor cooperation on notification processes, assistance and support requirements from the vendor? 1.2.5 – Concerns requiring vendors to provide documentation on how to apply, test updates and patches. Concern with critical vulnerabilities being a shorter update period than allowed for other types of updates. 1.2.6 – Concern with requiring vendor to keep logs, etc. of connection access activities. **R2** Page 9, second line from bottom – R2 is overly broad and the industry best practices and guidance statement makes it broader. **R3** How would utility verify software to be installed was not modified without the awareness of the software supplier and is not counterfeit? Concerns with items under Potential Software Integrity Controls on page 12 – validating the digital signature may not ensure the software's integrity – it is possible both the file and the signature could be compromised. Fingerprints or cipher hashes may not be available from all vendors. Concerns with items under Potential Software Authenticity Controls on page 12 – same concern over digital signature, as above. **R4** Concern with ambiguity of requiring the Responsible Entity to monitor authorized/unauthorized (inappropriate) access.

- Recommend removing the responsible entities section in this document as the entities are already outlined in the Standard itself.
- Page 1 Line 42: additional language should be added to address existing contract extensions or addendums, effectively excluding them as well.
- Recommend revising this document based on the revisions made to CIP-013.

We feel that there is inconsistency with the language of the Requirements and The Technical Guidance language specifically in reference to Requirement R3 and Requirement R4. The guidance section for both Requirements mentions reviewing security policies. However, the Requirements mention Risk Management Plans. We feel that this language needs to be properly aligned or this will lead to future Compliance Enforcement issues for the industry.

OSI Open Systems International - OSI Open Systems International - NA - Not Applicable - NA - Not Applicable

Answer	No
Document Name	

Comment

As a vendor of SCADA/EMS/TMS systems for many NERC Responsible Entities, OSI (Open Systems International Inc.) is providing the following comments to the NERC CIP-013 SDT for consideration. All suggested text additions are identified in ***bold-italics*** font.

R1.1.1 Identify and assess risk(s) during the procurement and deployment of vendor products and services;

OSI recommends that the SDT consider an additional comment for paragraph 5 as follows:

Personnel background and screening practices by vendors. ***Note that state & local laws may prevent vendors from sharing certain private information about their employees as related to their background screening (eg. social security numbers).***

OSI recommends that the SDT consider an additional comment for paragraph 9 as follows:

System Development Life Cycle program (SDLC) methodology from design through patch management to understand how cyber security is incorporated throughout their processes. ***Vendor policies showing adherence to appropriate industry standards for secure development***

processes is an acceptable method for Responsible Entities to demonstrate due diligence. An example of acceptable industry standards for secure development are the various System & Services Acquisition (SA) controls related to SDLC within NIST 800-161.

Note that NIST 800-161 is the standard used by U.S. Government entities to ensure Supply Chain Security for all departments and sites.

OSI recommends that the SDT consider an additional comment for paragraph 10 as follows:

Review of certifications and their alignment with recognized industry and regulatory controls. ***It is important that Responsible Entities consider which industry certifications are applicable for each vendor's line of business and not use a "one size fits all" approach. For example, NIST 800-161, ISO-27001 are relevant standards pertaining to computer system security. On the other hand, inclusion of requirements for non-relevant or specialized certifications could disqualify certain vendors (eg. certifications used by the financial industry).***

R1.2 Potential Procurement Controls

It is OSI's opinion that the current CIP-013 non-prescriptive approach to the development of procurement controls will lead to an unsustainable permutation of controls and associated contracts for vendors supporting the industry. The extreme diversity of procurement controls/contracts may push certain vendors away from the bidding process, ultimately reducing competition and increasing costs for the industry as a whole. OSI strongly urges that NERC and the CIP-013 SDT consider the addition of acceptable examples of compliance for different classifications of industry vendors eg. SCADA software vendors, RTU vendors, transformer vendors, etc. NERC and Regional Entity endorsement of such examples will provide both vendors and entities with a sensible baseline for procurement controls. OSI is providing an example of guidance for SCADA/EMS vendors as follows:

The following represents example procurement controls that can be considered for EMS/TMS/SCADA system vendors. This set of controls is not the only method of achieving compliance, but it is considered by NERC to be one acceptable method.

The following "National Institute of Standards and Technology" (NIST) standards can be used to satisfy R1.2. Controls that are applicable to the EMS/TMS/SCADA vendor should be extracted from the various sections to utilize within a procurement contract for compliance with R1.2.

- ***NIST 800-161: "Supply Chain Risk Management Practices for Federal Information Systems and Organizations"***

- ***AC – Access Controls***
- ***AT – Security Awareness and Training***
- ***AU – Audit and Accountability***
- ***CA - Security Assessment and Authorization***
- ***CM – Configuration Management***
- ***CP – Contingency Planning***
- ***IA – Identification and Authentication***
- ***IR – Incident***
- ***MP – Media Protection***
- ***PE – Physical and Environmental Protection***
- ***PL – Security Planning***
- ***PM – Security Program Management***
- ***PS – Personnel Security***
- ***PV – Provenance***
- ***RA – Risk Assessment***
- ***SA – System and Services Acquisition***
- ***SC – System and Communications Protection***
- ***SI - System and Information Integrity***

- ***NIST 800-82 "Guide to Industrial Control Systems (ICS) Security***

R1.2.3 Processes for disclosure of known vulnerabilities:

The guidance document currently states the following: *"Request vendor cooperation in obtaining, within a negotiated time period after establishing appropriate confidentiality agreement, access to summary documentation of uncorrected security vulnerabilities in the procured product that have not been publicly disclosed."*

Vendor release of information concerning **uncorrected** non-public vulnerabilities represents a security threat for the entire industry and is contrary to best practices in the software industry and most vendor's security policies. When a vendor provides such information to a single Responsible Entity, the entire industry is placed at further risk of the information being publically released without a mitigation. There are many industry documents on this topic and as an example OSI strongly urges that SDT review the "Vulnerability Disclosure Framework" documented on the DHS website from the National Infrastructure Advisory Council at the following link:

https://www.dhs.gov/sites/default/files/publications/niac-vulnerability-framework-final-report-01-13-04-508.pdf

The DHS publication states the following as part of its overall recommendations to the President:

"Protect the confidentiality of vulnerabilities for which no known exploitations have been reported while affected vendors are working towards a solution. Coordinate the voluntary disclosure of information regarding exploited vulnerabilities to take into account, among other factors, the risks of damage to the nation's critical infrastructure, the need for completion of ongoing investigations, and the coordinated release of solutions or remedies for the vulnerability."

Some Responsible Entities may believe that they can protect such critical information, but the reality is that their protection is only as strong as their weakest employee clicking on a phishing link. When you consider releasing uncorrected or unmitigated vulnerability details to multiple Responsible Entities of all sizes and levels of security training, the risk of that information falling into the hands of bad actors becomes very high.

OSI therefore strongly urges NERC and the CIP-013 SDT to remove the word "**uncorrected**" from the guidance statement. OSI believes it is critically important to utilize language that does not attempt to compel or otherwise recommend that Responsible Entities request disclosure of uncorrected or unmitigated vulnerabilities from any vendor. OSI will not agree to provide such information and most other vendors will likely adopt the same position. On the other hand, vendors that do agree to these provisions and the entities receiving such information are placing the entire industry at further risk until a mitigation is made available by the vendor – which could be weeks or months after bad actors

become aware of the vulnerability. Responsible vendors will not disclose uncorrected vulnerabilities but will provide recommended mitigations if they are available.

R1.2.5 Processes for verifying software integrity and authenticity of all software and patches that are intended for use:

OSI recommends additional wording in the final paragraph as follows:

When third-party components are provided by the vendor, request vendors provide appropriate updates and patches to remediate newly discovered vulnerabilities or weaknesses ***within a reasonable period that enables the vendor to integrate and complete certification testing of the updated third-party component.***

R1.2.6 Coordination of remote access controls for (i) vendor-initiated Interactive Remote Access and (ii) system-to-system remote access with a vendor(s); and

OSI recommends additional wording in the 3rd paragraph as follows:

Request vendors maintain their IT assets (hardware, software and firmware) connecting to Responsible Entity network with current updates to remediate security vulnerabilities or weaknesses identified by the original OEM or Responsible Entity. ***The vendor's use of a proxy or intermediate host to provide isolation of connections to Responsible Entity's equipment is one example of best practices for remote access.***

R1.2.7 Other process(es) to address risk(s) as determined in Part 1.1.2, if applicable

OSI recommends additional wording in the 1st paragraph as follows:

Request vendors provide Responsible Entity with audit rights that allow the Responsible Entity or designee to audit vendor's security controls, development and manufacturing controls, access to certifications and audit reports, and other relevant information. ***Responsible Entity review of vendor audit reports completed by industry recognized certification groups can be used as an acceptable method to verify a vendor's security posture. Examples are certified auditor reports for ISO-27001, NIST, etc.***

R4 Part 4.1 Potential Remote Access Controls

Based on the NERC Lessons Learned document at this link (http://www.nerc.com/pa/CI/tpv5impmntnstdy/Vendor%20Access%20Management%20Lesson%20Learned.pdf) , OSI recommends additional wording as follows: ***One acceptable example of best practice is to use a process whereby the remote access session is initiated by the Responsible Entity, and the token code is provided verbally from the Entity to the vendor when requested by the authentication system. This method ensures that the Responsible Entity is in control of the session and the vendor is not allowed access without knowledge of the Entity.***

The guidance document is suggestions or recommendations. Request replacing all imperative language such as “should” with discretionally language such as “may”. The term “supplier” is used in the guidance document. Recommend replacing with Vendor or providing clarification on the difference between the two. The Rational sections of CIP-013 standard and the guidance document uses the term “information system”. Recommend replace this with the appropriate NERC defined term: BES Cyber System, Cyber Asset…. Or define the term. Vendor should be a defined term. Suppliers should also be defined. Also, need consistent use of vendor vs third-party. Are sub-component manufacturers included? Page 1, line 37 that starts with “These cyber system cover the scope of assets needed….” to “These Cyber Assets cover the scope needed …” The term “assets” is not defined by NERC but is used in CIP-003 to identify substations and generation assets. Page 2, line 23. The sentence “Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan” should be changed to “Obtaining specific controls in the negotiated contract may not be feasible. In these cases, failure to obtain and implement these controls is not considered a failure to implement an entity's plan.” Page 2, line 32: change “cited to the BlackEnergy” to “Cited the BlackEnergy”. Page 2, line 46: Change this line to be “In the development of the supply chain risk management plan, the responsible entity may consider the following:”. It seems like the bullets listed on page 8 seem to be considered in the development of the supply chain risk management plan and not in the implementation of the plan. Page 3: The format that NERC uses for writing standards is that bulleted items are “or” clauses. These bullets should be numbered and not bullets. This is an issue in multiple places in this document.

Page 3, line 24: This paragraph is not consistent with the SDT response given during the 2/2/17 webinar when asked what a responsible entity should do when a vendor will not or cannot agree to controls required by this standard. The SDT said, "find another vendor." Request that the SDT clarify a consistent answer.

Page 3, line 32: Please provide clarity to the meaning of the word "mitigate" and the possible expectation that all risks can be mitigated 100%. Would the phrase used on line 39 be better: "mitigating controls to reduce the risk"?

Page 4, line 29: The System Development Life Cycle program (SDLC) seems like a defined program. Provide reference to the standard, document or agency that can give details on this.

Page 5, line 14: *determine mitigating controls* implies implementation, which is different than the requirement to *evaluate methods*

Page 5, line 14: R 1.1 states "The use of controls in planning and development". This line states "applied in procurement and/or operational phase of product or service acquisition and implementation". The "and/or operational" phase is an unnecessary modifier for "product or service acquisition and implementation". It could be interpreted to extend the scope beyond the planning and development cycles. Recommend deleting "and/or operational phase of".

Page 6, line 1. Provide explanation on how the term "vendor" used in the requirements relates to "supplier's system component, system integrators, or external service providers."

Page 6., line 5. Notification of all "identified, threatened attempt" is too broad for large and highly visible vendors like Microsoft. The scope should be limited to only the identified, successful breaches in the vendor's security that the vendor determines could have impact on the entities equipment or services associated with BES Cyber Systems.

Page 6, line 6: Is the ("Security Event") being used to define a term that is used not only in this document but in R1.2.1? If so, it should be a NERC Glossary term. If the term is defined by the language here, recommend that "have potential adverse impacts to the availability or reliability of BES Cyber Systems" be part of the definition.

Page 6, line 22: For R1.2.2: The requirement for the "process for notification" is very different than the "request vendor cooperation" guidance given. Request clarification as to how this guidance for "requested cooperation" would meet the required "notification".

Page 9 lines 6 and 8: correct numbers "2.2" and "2.3" to be "2.1" and "2.2".

Page 11, Line 15, replace supplier with Vendor.

Page 11, line 25, replace “should” with “may”

Page 12, line 3-9 italicize to be consistent with other areas of this guidance when the Requirements are quoted.

Page 12 line 13. Provide clarity that system-to-system is equivalent to machine-machine.

Page 12 line 33. Provide additional clarity on “monitor”. Is reviewing logs considered monitoring or is this actively viewing the actions being performed through the remote access session? If it is the latter, how would this be done on a system-to-system remote access session?

Page 14, line 15 Monitoring and logging are listed as separate items in both the guidance and the Standard. Request guidance on the use of logging as a monitoring activity.

Page 15, line 23 Provide guidance on the meaning of “timely manner.” Would responding to an issue discovered in a 30-day log review be considered timely? How does “timely manner” align with “during the remote access session” language of R4.3.

Page 16 line 25, replace “should” with “may”.

The Implementation Plan should more clearly state that contract renegotiation is not necessary during the implementation period if a contract has already begun.

“Vendor” should be a defined term. The Standard should have consistent use of the terms, i.e., only use “vendor” and do not say “third-party.”

Are sub-component manufacturers included under the term “vendor”?

Based on FE's comments on the Requirements (R1-R5), a detailed review of the Technical Guidance and Examples document is not relevant at this time. However, FE suggests that, in general, it would be helpful if the Technical Guidance and Examples document could provide evidence formats, similar to what is provided in CIP-003-6 Attachment 2.

SRP requests adding possible logical controls in addition to the physical controls listed on Page 12, 4th bullet under both software integrity and authenticity controls. This bullet lists only physical controls such as tamper proof packaging.

SRP requests that the Technical Guidance and Examples be included in the standard consistent with the other CIP standards.

SRP requests clarification on the term "supplier" as it is used in the guidance document. SRP requests replacing with the term vendor or providing clarification on the difference between the two.

In the guidance document on page 6, line 1, SRP requests an explanation on how the term "vendor" used in the requirements relates to "supplier's system component, system integrators, or external service providers."

The Rationale sections of CIP-013 standard and the guidance document use the term "information system". SRP requests replacing this with the appropriate NERC defined term: BES Cyber System, Cyber Asset. If the term cannot be replaced SRP requests that the SDT define the term and place it in the NERC Glossary of Terms.

SRP requests that the SDT consider defining the term “Security Event” (page 6, line 6 and R1.2.1) and placing it in the NERC Glossary of Terms. SRP requests that the following language be added to the definition “have potential adverse impacts to the availability or reliability of BES Cyber Systems” and that the entities be required to report only newly identified security vulnerabilities.

Additionally, SRP requests that the SDT define the term “vendor security event” or replace it with “identification of a new security vulnerability that could have potential adverse impact to the availability or reliability of BES Cyber System.”

Portions of the *Technical Guidance and Examples* document that may affect how the standard is interpreted for audit purposes should be placed in the standard's Guidelines and Technical Basis section and needs to be balloted and approved by industry. As this is not a part of the standard and is not a CMEP Practices Guide, this document should provide implementation guidance in a manner consistent with the NERC Compliance Guidance Policy "to develop examples or approaches to illustrate how registered entities could comply with a standard that are vetted by industry and endorsed by the ERO Enterprise." The implementation guidance is an important item for this standard and Seminole appreciates this work.

As implementation guidance, this document should provide a clear standard manner to address requirements for R1.1 and R1.2.1-R1.2.6, while entities may be able to ask additional questions. While the document discusses ideas of what to include, the biggest value would be to provide an example set of specific questions to vendors on risk management controls. By setting this specification up front, costs drop for both vendors and entities as the vendors can provide the basic set of information in a defined format. Once vendors have a better defined set of expectations, they then know how to meet these expectations across the industry, Further, vendors focused on the electric sector will provide this information, as we are their market. However, we all also use smaller software and hardware vendors that primarily service a broader market, and these smaller vendors would be less willing to provide custom information for separate electric sector entities for a sale amounting to tens or hundreds of dollars.

Open source software does not have a cost or a defined vendor. Risk assessment of open source software should be specifically addressed.

As there is no consistency in the software industry on use of hash functions, guidelines need to be provided on what is considered an acceptable approach to meet this requirement.

This standard essentially eliminates the ability to purchase equipment or services on an emergency basis without a pre-existing contract. This will interfere with incident response and BES recovery operations under extraordinary circumstances.

More focus should be given to implementation as opposed to justification. I think we all agree with respect to the importance of making sure the Supply Chain is free of malware and although some justification may be necessary to further explain the merits of adding a few additional requirements to the process, overall we are more concerned with implementation strategy. Those implementation methods would better serve us in our own internal controls and for evidence preparation in order to meet the compliance objectives.

AEP is concerned about the use of the term “should” in the *Technical Guidance and Examples* document. While AEP understands that the intent of this document is to provide guidance and examples, the use of term “should” may be interpreted by the regional auditors as closer to a mandatory requirement. In order to address this concern, the document could use the term “may” instead. AEP is concerned that this is a shift away from traditional guidelines and technical basis documents, which documents the drafting team’s considerations. The proscriptive nature of this document is concerning when left to the interpretation of different auditors. AEP would not want this document to become akin to an actual Requirement without going through the proper process.

The statement on p.1 that CIP-013-1, “does not require the Responsible Entity to renegotiate or abrogate existing contracts,” implies that no action needs to be taken for existing PEDs. This point should be made explicit in the standard per se, but our “additional comments” concerns would still apply for replacing or upgrading existing equipment. The Technical Guidance and Examples document should be revised to address our negative-ballot comments. Our concerns regarding willingness and ability of vendors to be CIP-013-friendly appear to already be at least partly recognized, ref. for example the statement on p.3, “Obtaining the desired specific cyber security controls in the negotiated contract may not be feasible with each vendor.” The subsequent comment that “every negotiated contract will be different,” indicates however that we and the SDT are not on common ground regarding practicality.

Although NERC's Compliance Guidance Policy document describes certain procedures by which a drafting team may provide Compliance Guidance, ERCOT suggests that it is generally preferable to provide examples of acceptable conduct in the standard itself, rather than in an ancillary document, which Responsible Entities would have to remember and separately locate and review. The team could achieve this purpose by using language in the standard such as: "Practices that comply with this requirement include, without limitation, the following: . . . ." ERCOT notes that in a number of instances, the draft Technical Guidance and Examples document uses normative language (e.g., "should"), rather than permissive (e.g., "may") language, which suggests that the Technical Guidance document is instead intended to serve	

simply as a more detailed set of requirements, as opposed to describing one of potentially many acceptable methods of achieving compliance. For example, the guidance for R1 states: "In implementing Requirement R1, the responsible entity should consider the following: . . . ." To the extent the drafting team intends the guidance in this document to be followed, it should be included in the standard.

The Technical Guidance Document is well-written based upon what the NERC Drafting Team had to work with, but the controls recommendations are expansive enough to become its own industry. This would be an excellent document to use as a starting point of conversation with our hardware and software supply chain, but to impose it on the Entities as the end customers of these ICS products and applications would be overly burdensome with very little return on investment. This would be particularly true for those Entities dealing only with Low Impact BCS.

1) The guidance document is suggestions or recommendations. Request replacing all imperative language such as “should” with discretionally language such as “may”.

2) The term “supplier” is used in the guidance document. Recommend replacing with Vendor or providing clarification on the difference between the two.

3) The Rational sections of CIP-013 standard and the guidance document uses the term “information system”. Recommend replace this with the appropriate NERC defined term: BES Cyber System, Cyber Asset…. Or define the term.

4) Vendor should be a defined term. Suppliers should also be defined. Also, need consistent use of vendor vs third-party. Are sub-component manufacturers included?

5) Page 1, line 37 that starts with “These cyber system cover the scope of assets needed….” to “These Cyber Assets cover the scope needed …” The term “assets” is not defined by NERC but is used in CIP-003 to identify substations and generation assets.

6) Page 2, line 23. The sentence “Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan” should be changed to “Obtaining specific controls in the negotiated contract may not be feasible. In these cases, failure to obtain and implement these controls is not considered a failure to implement an entity's plan.”

7) Page 2, line 32: change “cited to the BlackEnergy” to “Cited the BlackEnergy”.

8) Page 2, line 46: Change this line to be “In the development of the supply chain risk management plan, the responsible entity may consider the following:”. It seems like the bullets listed on page 8 seem to be considered in the development of the supply chain risk management plan and not in the implementation of the plan

9) Page 3: The format that NERC uses for writing standards is that bulleted items are “or” clauses. These bullets should be numbered and not bullets. This is an issue in multiple place in this document.

10) Page 3, line 24: This paragraph is not consistent with the SDT response given during the 2/2/17 webinar when asked what a responsible entity should do when a vendor will not or cannot agree to controls required by this standard. The SDT said, “find another vendor.” Request that the SDT clarify a consistent answer.

11) Page 3, line 32: Please provide clarity to the meaning of the word “mitigate” and the possible expectation that all risks can be mitigated 100%. Would the phrase used on line 39 be better: “mitigating controls to reduce the risk”?

12) Page 4, line 29: The System Development Life Cycle program (SDLC) seems like a defined program. Provide reference to the standard, document or agency that can give details on this.

13) Page 5, line 14: *determine mitigating controls* implies implementation, which is different than the requirement to *evaluate methods*

14) Page 5, line 14: R 1.1 states “The use of controls in planning and development”. This line states “applied in procurement and/or operational phase of product or service acquisition and implementation”. The “and/or operational” phase is an unnecessary modifier for “product or service acquisition and implementation”. It could be interpreted to extend the scope beyond the planning and development cycles. Recommend deleting “and/or operational phase of”.

15) Page 6, line 1. Provide explanation on how the term “vendor” used in the requirements relates to “supplier’s system component, system integrators, or external service providers.”

16) Page 6., line 5. Notification of all “identified, threatened attempt” is too broad for large and highly visible vendors like Microsoft. The scope should be limited to only the identified, successful breaches in the vendor’s security that the vendor determines could have impact on the entities equipment or services associated with BES Cyber Systems.

17) Page 6, line 6: Is the (“Security Event”) being used to define a term that is used not only in this document but in R1.2.1? If so, it should be a NERC Glossary term. If the term is defined by the language here, recommend that ”have potential adverse impacts to the availability or reliability of BES Cyber Systems“ be part of the definition.

18) Page 6, line 22: For R1.2.2: The requirement for the ”process for notification” is very different than the “request vendor cooperation” guidance given. Request clarification as to how this guidance for “requested cooperation” would meet the required “notification”.

19) Page 9 lines 6 and 8: correct numbers “2.2” and “2.3” to be “2.1” and “2.2”.

20) Page 11, Line 15, replace supplier with Vendor.

21) Page 11, line 25, replace “should” with “may”

22) Page 12, line 3-9 italicize to be consistent with other areas of this guidance when the Requirements are quoted.

23) Page 12 line 13. Provide clarity that system-to-system is equivalent to machine-machine.

24) Page 12 line 33. Provide additional clarity on “monitor”. Is reviewing logs considered monitoring or is this actively viewing the actions being performed through the remote access session? If it is the latter, how would this be done on a system-to-system remote access session?

25) Page 14, line 15 Monitoring and logging are listed as separate items in both the guidance and the Standard. Request guidance on the use of logging as a monitoring activity.

26) Page 15, line 23 Provide guidance on the meaning of “timely manner.” Would responding to an issue discovered in a 30-day log review be considered timely? How does “timely manner” align with “during the remote access session” language of R4.3.

27) Page 16 line 25, replace “should” with “may”.

Requirement R1 needs to be vendor focused. It is not appropriate to assign risk based on the categorization of BES Cyber System impacted by the procurement. This Standard is for supply chain management, not BES Cyber System management. The guidance should not be limited to a brief discussion of Black Energy. To the contrary, the risks presented by Havex appear to be the stronger driver of need as perceived by FERC. It is imperative that vendor risk management controls, such as those cited on Page 4, starting at Line 13, comport with the substantively same or similar requirements of other CIP Standards before being allowed. The Guidance should also address the situation where the Registered Entity has chosen a patch source, per CIP-007-6, Requirement R2, that is not the originator of the software. For	

example, where the Registered Entity chooses to get its Microsoft and Linux patches from its SCADA/EMS vendor. Some sort of integrity chain needs to be verified.

The Technical Guidance Document is well-written based upon what the NERC Drafting Team had to work with, but the controls recommendations within this document are expansive enough to become its own industry. This would be an excellent document to use as a starting point of conversation with our hardware and software supply chain, but to impose it on the Entities as the end customers of these ICS	

products and applications would be overly burdensome with very little return on investment. This would be particularly true for those Entities dealing only with Low Impact BCS.

R1: The Compliance Guidance states: “Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts, consistent with Order No. 829 (P 36) as specified in the Implementation Plan.” What qualifies as an existing contract? Is there an obligation to implement the risk management plan when: (1) negotiating and executing a new Statement of Work; (2) negotiating an amendment to a Master Agreement; or (3) renewing a contract under existing terms? The answer to these questions should be clarified and directly addressed in the standard or in the implementation plan. Please clarify how existing versus new procurement elements are addressed, especially for R3 and R4 technical controls.

SMUD requests adding possible logical controls in addition to the physical controls listed on Page 12, 4th bullet under both software integrity and authenticity controls. This bullet lists only physical controls such as tamper proof packaging.

SMUD requests that the Technical Guidance and Examples be included in the standard consistent with the other CIP standards.

SMUD requests clarification on the term “supplier” as it is used in the guidance document. SMUD requests replacing with the term vendor or providing clarification on the difference between the two.

In the guidance document on page 6, line 1, SMUD requests an explanation on how the term “vendor” used in the requirements relates to “supplier’s system component, system integrators, or external service providers.”

The Rationale sections of CIP-013 standard and the guidance document use the term “information system”. SMUD requests replacing this with the appropriate NERC defined term: BES Cyber System, Cyber Asset. If the term cannot be replaced SMUD requests that the SDT define the term and place it in the NERC Glossary of Terms. SMUD requests that the SDT consider defining the term “Security Event” (page 6, line 6 and R1.2.1) and placing it in the NERC Glossary of Terms. SMUD requests that the following language added to the definition “have potential adverse impacts to the availability or reliability of BES Cyber Systems” and that the entities be required to report only newly identified security vulnerabilities. Additionally, SMUD requests that the SDT define the term “vendor security event” or replace it with “identification of a new security vulnerability that could have potential adverse impact to the availability or reliability of BES Cyber System.”

1) The term “supplier” is used in the guidance document. Recommend replacing with Vendor or providing clarification on the difference between the two.

2) The Rational sections of CIP-013 standard and the guidance document uses the term “information system”. Recommend replace this with the appropriate NERC defined term: BES Cyber System, Cyber Asset…. Or, define the term.

3) Page 6, line 1. Provide explanation on how the term “vendor” used in the requirements relates to “supplier’s system component, system integrators, or external service providers.”

4) Page 6, line 6: Is the (“Security Event”) being used to define a term that is used not only in this document but in R1.2.1? If so, it should be either defined in this standard or in the NERC Glossary of Terms. If the term is defined by the language here, recommend that ”have potential adverse impacts to the availability or reliability of BES Cyber Systems“ be part of the definition. The “threatened, attempted” part of this definition would is too large in scope and could require large vendors like Microsoft or Cisco to report thousands or millions of attempts each day. Suggest replacing “vendor security event” in R1.2.1 with “identification of a new security vulnerability that could have potential adverse impact to the availability or reliability of BES Cyber System.”

5) Page 6, line 12: It is unclear that the R1.2.1 requires notification by the entity to the vendor.

6) Suggest adding possible logical controls in addition to the physical controls listed on Page 12, 4th bullet under both software integrity and authenticity controls. This bullet lists only physical controls such as tamper proof packaging.

7) In other standards, the Guidelines and Technical Basis document is included in the standard, suggest that this also be completed for CIP-013.

The Technical Guidance and Example language states, “Entity processes for addressing software risks and vendor remote access risks per Requirements R3 and R4. Consider whether to include low impact BES Cyber Systems in these processes, or alternatively develop a separate cyber security policy or process(es) to address low impact BES Cyber Systems.” R5 states that Responsible Entities must have “one or more documented cyber security policies.” IPC would like to know why the Technical Guidance and Examples language directs Responsible Entities to consider developing “processes” to meet a requirement that explicitly states that Responsible Entities must have “one or more documents cyber security policies” to meet the requirement?

Wendy Center - U.S. Bureau of Reclamation - 5	
Answer	No
Document Name	
Comment	
Though each of the objectives in Order 829 is addressed, Reclamation recommends a more simplified format for the requirements as the SDT originally suggested in the webinar on November 10, 2016. The entire standard addresses supply chain risk management and therefore should address the possible risks and possible controls for entities to consider for each stage of the life cycle of a system in which there is interaction with and dependence on vendors, their products, and/or their services. These may include but are not limited to evaluation of design, procurement, acquisition, testing, deployment, operation, and maintenance. Reclamation recommends the technical guidance document provide examples of risks and their respective controls (such as contract clauses) for entities to consider.

This document identifies some shortcomings, pitfalls, and/or unintended consequences of prescribing requirements within a mandatory reliability standard and is evidence that a Reliability Standard may not be the best vehicle to address the complexities and broad range of individual Registered Entity nuances in process and infrastructure, on top of the host of jurisdictional, technical, economic, and business relationship issues associated to supply chain; and further demonstrates the essentiality of reconsidering the need for CIP-013-1.

(Page 2, lines 2-3) An entity should define its specific approach to the SCRM plan in the preamble, so the Regional Entity will be able to evaluate the development and application of the plan.

(Page 2, lines 16-24: This passage gives entities a huge pass on implementation. As long as the entity asked the vendor to play nice during the RFP process, it appears the entity may not be found in noncomoliance if the final vendor contract does not include part or all of the entity's SCRM RFP clauses. This means it will be important to evaluate both the RFP and the final Service Level Agreement [SLA]/Contract for a specific

applicable BCS. This review may lead to Recommendations and/or Areas of Concern [AoC], but might be difficult to substantiate Possible Non-Compliance [PNC] Finding as long as the RFP process aligns with the entity's SCRM plan.

(Page 2, line 37). This is true only if such actions are specified in the vendor's SLA.

(Page 3, lines 9-10). This was discussed on an earlier SCRM SDT call, if a vendor can demonstrate that it is certified by ISO or some other certification organization, it may provide a statement to that effect, in lieu of specific agreements with each customer. This issue may still be fluid, but should be included in the final Guidance, as well, in order to satisfy FERC's directive to not extend CIP-013-1 beyond the purview of Section 215 to vendors.

(Page 3, lines 29-30). It appears the key element in this passage is to ensure entities have implemented a sound SCRM program and suitable processes to mitigate vendor risk, it does not require entities to take extraordinary measures to ensure all such processes are included in final SLAs.

(Page 3, lines 42-44) We can reasonably expect most, if not all, SCRM plans to follow the guidelines below to incorporate applicable controls into the plan. However, these suggested controls are best practices, but not mandatory controls. Entities can use these guidelines as an initial starting point for the development of the SCRM plan, as can the Regional Entities for review and evaluation of the R1 SCRM plan at audit..

(Page 4, footnote 1). This footnote cites a third party commercial product. WECC's approach to maintaining auditor independence includes its position to never endorse, recommend, or otherwise indicate favorite vendor status to any consultant, vendor, or product. As a result of this approach, WECC does not consider it appropriate to recommend or endorse a specific tool such as this product.

(Page 5, lines 34-37). This bullet addresses the potential for contractual controls for SCRM that stems from a sound RFP process and procedures. If an entity takes this approach, WECC would expect to see an RFP template that includes specific cyber security terms and expectations. We would then sample for completed RFPs to evaluate the entity's implementation of this approach.

(Page 6, Section 1.2.1 line 4). Unless these processes are specifically included in a vendor SLA or other binding document, it will be difficult for a Regional Entity to evaluate anything other than the entity's plan for such notifications. Since the burden of proof cannot be passed along to the vendor other than through contract, the audit of most of these 1.2.x sections may generally be nothing more than a review of the entity's plan.

(Page 10, lines 6-7). Communications and training materials relative to SCRM should also be addressed in the entity's overall Cyber Security Awareness program. (Page 13, R4). As mentioned in the R4 comments above, this is a major security concern from WECC's perspective and should leverage and expand upon an entity's controls and procedures for Interactive Remote Access [IRA] from CIP-005-5 R2. (Page 16, R5). An entity can leverage its R3 and R4 controls to support R5, but it is not required to do so. However. based on prior discussions with entities relative to CIP-010-2 R4, in practice, WECC would expect to see implementation efforts of this nature relative to SCRM controls for Low-impact BCS.

Comment

PSEG appreciates the standard drafting team's effort in providing technical guidance and examples to provide additional clarity and implementation support for the registered entities. PSEG has the following questions/recommendations to the Technical Guidance and Examples document below:

- The term vendors as used in the standards is defined (Page iv Line 6) in the Technical Guidance and Examples document (as well as in the Rationale for Requirement R1 in the draft CIP-013 Standard). This term should be officially defined in the Glossary of Terms used in NERC Reliability Standards.

- Page 4, line 37: Add the wording "as determined by the Registered Entity" after the word components. The new statement would state, "Define any critical elements or components, as determined by the Registered Entity, that may impact the operations or reliability of BES Cyber Systems". This change aligns with the FERC order (p31) statement that the standard should have flexibility to account for varying " differences in the needs and characteristics of responsible entities and the diversity of BES Cyber System environments, technologies, and risks" to determine the critical elements and components that may impact operations or reliability of BES Cyber systems based on the registered entities implementation of a vendor system or component within their program.

- Page 5, line 24: Add the wording "as identified by the Registered Entity" after the word "risks". The new statement would state, "Review and address other risks as identified by the Registered Entity in Requirement R1 Part 1.1.1." Recommend this change to align with the change to technical guidance for Requirement 1.1.1 (Page 4, line 37) above.

- Page 6, line 43: Replace the word "breaches" with "vulnerabilities and threats" to align with the use of the word "vulnerabities" in the requirement language.

- Page 7, line 1: Replace the word "breach" with "vulnerability" to align with the use of the word "vulnerabities" in the requirement language.

- Page 7, line 9: Remove the words "availability or". The NERC CIP reliability standards require protecting BES Cyber Systems to support reliable operation of the BES. Recommend removing availability to align with the wording used throughout the NERC CIP reliability standards.

• Page 13, line 9: Recommend changing Requirement 4.3, from “Disabling or otherwise responding to unauthorized activity during remote access sessions“to “Disabling or otherwise responding to detected unauthorized activity associated with remote access sessions.” (see comment under question 4) • Page 15, line 22: Recommend adding the word “detected” to align with the recommended changes to Requirement 4.3. The statement would become “Set up alerting and response processes so that detected inappropriate vendor remote access sessions may be disabled or otherwise responded to in a timely manner. • Page 15, line 23: The words “in a timely manner” are overly subjective. Recommend specifying a specific time frame for a timely response.

There is inconsistency with the language of the Requirements and the Technical Guidance language, specifically in reference to Requirement R3 and Requirement R4. The guidance sections for both Requirements mention reviewing security policies, however, the Requirements mention Risk Management Plans. NRG suggests that this language be properly aligned or else this could lead to future Compliance Enforcement issues for the industry. NRG requests SDT clarity that system-to-system is equivalent to machine-machine.

On Page 9, line 43, the Technical Guidance and Examples references the use of industry best practices and guidance that improve cyber security risk management controls. This does not match the rationale of R2 which only speaks to the use of guidance. Exelon feels that the reference to “industry best practices” should be removed from the Technical Guidance and Examples since it is non-specific and open to interpretation.

The term “supplier” is used in the guidance document. Recommend replacing with Vendor or providing clarification on the difference between the two.

The Rational sections of CIP-013 standard and the guidance document uses the term “information system”. Recommend replace this with the appropriate NERC defined term: BES Cyber System, Cyber Asset…. Or, define the term.

Vendor should be a defined term. Suppliers should also be defined. Also, need consistent use of vendor vs third-party. Are sub-component manufacturers included?

Page 1, line 37 that starts with “These cyber system cover the scope of assets needed….” to “These Cyber Assets cover the scope needed …” The term “assets” is not defined by NERC but is used in CIP-003 to identify substations and generation assets.

Page 2, line 23. The sentence “Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan” should be changed to “Obtaining specific controls in the negotiated contract may not be feasible. In these cases, failure to obtain and implement these controls is not considered a failure to implement an entity's plan.”

Page 2, line 32: change “cited to the BlackEnergy” to “Cited the BlackEnergy”.

Page 2, line 46: Change this line to be “In the development of the supply chain risk management plan, the responsible entity may consider the following:”. It seems like the bullets listed on page 8 seem to be considered in the development of the supply chain risk management plan and not in the implementation of the plan

Page 3: The format that NERC uses for writing standards is that bulleted items are “or” clauses. These bullets should be numbered and not bullets. This is an issue in multiple place in this document.

Page 3, line 24: This paragraph is not consistent with the SDT response given during the 2/2/17 webinar when asked what a responsible entity should do when a vendor will not or cannot agree to controls required by this standard. The SDT said, “find another vendor.” Request that the SDT clarify a consistent answer.

Page 3, line 32: Please provide clarity to the meaning of the word “mitigate” and the possible expectation that all risks can be mitigated 100%. Would the phrase used on line 39 be better: “mitigating controls to reduce the risk”?

Page 4, line 29: The System Development Life Cycle program (SDLC) seems like a defined program. Provide reference to the standard, document or agency that can give details on this.

Page 5, line 14: *determine mitigating controls* implies implementation, which is different than the requirement to *evaluate methods*

Page 5, line 14: R 1.1 states “The use of controls in planning and development”. This line states “applied in procurement and/or operational phase of product or service acquisition and implementation”. The “and/or operational” phase is an unnecessary modifier for “product or service acquisition and implementation”. It could be interpreted to extend the scope beyond the planning and development cycles. Recommend deleting “and/or operational phase of”.

Page 6, line 1. Provide explanation on how the term “vendor” used in the requirements relates to “supplier’s system component, system integrators, or external service providers.”

Page 6, line 6: Is the ("Security Event") being used to define a term that is used not only in this document but in R1.2.1? If so, it should be either defined in this standard or in the NERC Glossary of Terms. If the term is defined by the language here, recommend that "have potential adverse impacts to the availability or reliability of BES Cyber Systems" be part of the definition. The "threatened, attempted" part of this definition would is too large in scope and could require large vendors like Microsoft or Cisco to report thousands or millions of attempts each day. Suggest replacing "vendor security event" in R1.2.1 with "identification of a new security vulnerability that could have potential adverse impact to the availability or reliability of BES Cyber System."

Page 6, line 12: It is unclear that the R1.2.1 requires notification by the entity to the vendor.

Page 6, line 22: For R1.2.2: The requirement for the "process for notification" is very different than the "request vendor cooperation" guidance given. Request clarification as to how this guidance for "requested cooperation" would meet the required "notification".

Page 9 lines 6 and 8: correct numbers "2.2" and "2.3" to be "2.1" and "2.2".

Page 11, Line 15, replace supplier with Vendor.

Page 11, line 25, replace "should" with "may"

Page 12, line 3-9 italicize to be consistent with other areas of this guidance when the Requirements are quoted.

Page 12 line 13. Provide clarity that system-to-system is equivalent to machine-machine.

Page 12 line 33. Provide additional clarity on "monitor". Is reviewing logs considered monitoring or is this actively viewing the actions being performed through the remote access session? If it is the latter, how would this be done on a system-to-system remote access session?

Page 14, line 15 Monitoring and logging are listed as separate items in both the guidance and the Standard. Request guidance on the use of logging as a monitoring activity.

Page 15, line 23 Provide guidance on the meaning of "timely manner." Would responding to an issue discovered in a 30-day log review be considered timely? How does "timely manner" align with "during the remote access session" language of R4.3.

Page 16 line 25, replace "should" with "may".

Suggest adding possible logical controls in addition to the physical controls listed on Page 12, 4th bullet under both software integrity and authenticity controls. This bullet lists only physical controls such as tamper proof packaging In other standards, the Guidelines and Technical Basis document is included in the standard, suggest that this also be completed for CIP-013.

We did review the TG&E document briefly and it was valuable in illustrating how some of the team members were viewing various requirements; however, it will need to be further refined once the changes are made to the requirements. We did note that in the discussion of integrity and authenticity, there was a lot of duplication in methods between the two making it seem that there might be some fuzziness on what each of the two descriptors are trying to address.

9. Provide any additional comments for the SDT to consider, if desired.

Summary Consideration. The SDT thanks all commenters. The SDT made significant revisions to proposed CIP-013-1 and developed revisions to other CIP standards as suggested by stakeholders. The SDT believes these changes are responsive to stakeholder feedback and meet the reliability objectives in the Project 2016-03 Standards Authorization Request (SAR) that was accepted by the Standards Committee in January 2017. Some stakeholders commented on issues that are beyond the scope of Order No. 829 and the Project 2016-03 SAR. The SDT is not proposing revisions that are outside of the established project scope or that the SDT believes would not meet the project objectives.

In voting “no” on this proposed Reliability Standard, MRO acknowledges the impossible challenge faced by the Standard Drafting Team and NERC in developing a Supply Chain Reliability Standard as directed in FERC Order No. 829 issued July 21, 2016. Federal Energy Regulatory Commission (FERC) Acting Chairman LaFleur (then a commissioner), stated in her dissenting opinion, “[E]ffectively addressing cybersecurity threats in supply chain management is tremendously complicated, due to a host of jurisdictional, economic, and business relationship issues.”

As a regulator, MRO seeks to provide clarity about Reliability Standard requirements, assurance around compliance with those Reliability Standards, and results – reduced risk to the reliable operation of the bulk power system (BPS). Adoption of the proposed Reliability Standard will not meet these goals.

The proposed Reliability Standard directs registered entities to complete tasks that require agreement of vendors that are not subject to the jurisdiction of the FERC or the Electric Reliability Organization (ERO). To accommodate this lack of jurisdiction, the proposed Reliability Standard is drafted sufficiently vague to allow for lack of vendor agreement and compliance with the Reliability Standard to exist at the same time. For example, Requirement 1 of CIP-013 obligates registered entities to implement supply chain risk management plans. At the same time, the supporting Rationale states, “obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement the entity’s plan.” In essence, this Requirement forces entities to develop a plan, but a failure to be able to implement the plan

is not an issue of noncompliance. The root cause of the problem is that the risk lies with vendors, a third party not subject to FERC or ERO jurisdiction. Thus, the Reliability Standard becomes more paperwork and administrivia than mitigation of risk. See the comments of the MRO stakeholder-driven NERC Standards Review Forum.

As a regulator, MRO believes the proposed Reliability Standard cannot be effectively and efficiently assessed and therefore MRO would not be able to provide assurance of compliance or, more important, assurance of reduced risk to the reliable operation of the BPS. As drafted, MRO will be expected to determine if registered entities made a reasonable attempt to address supply chain risks through their procurement processes. Since contracts are always a give and take with regard to a number of provisions, how does a regulator efficiently and effectively monitor one aspect of the contract negotiation process to determine reasonableness and the possible existence of countermeasures to address security throughout the procurement process which may be beyond our jurisdiction and rest with best security practices?

In addition, the draft Reliability Standard does not address supply chain management comprehensively. For example, the issues associated with vendors of the vendors are not addressed. It is very common for an Energy Management System (EMS) vendor to deliver a system with third party software, such as Adobe®, Java, or even open-sourced software such as PuTTY. The vendor chain for any system can be deep and the proposed Reliability Standard does not provide registered entities clarity on how to deal with these routine layers of vendors.

Finally, it is also important to consider the potential economic impact on future contract negotiations between registered entities and vendors. The proposed CIP-013 directs a registered entity to address supply chain risks in its vendor contracts. How much does the registered entity pay to manage supply chain risk when the vendor has no legal obligation to accommodate the registered entity? By placing additional requirements on vendors, do we unintentionally reduce competition, increase costs, and reduce innovation? Furhtermore, the possibility of less competition, creates less diversity across the bulk power system and less diversity increases risk.

Reducing supply chain risk to the reliable operations of the BPS and providing the requisite regulatory assurance that that risk has been reduced is a complex task for the very reasons FERC Acting Chairman LaFleur communicated in her dissent. Whether or not this risk is best addressed by a NERC Reliability Standard as opposed to a security framework, an IEEE standard or use of military grade components merits greater consideration. This is particularly true given four of the five FERC commissioners will have either not considered or not supported FERC Order 829 when the proposed Reliability Standard is ultimately filed with FERC. Following the comment period, MRO recommends that FERC and the ERO consider whether we have the appropriate structure and expertise to address and mitigate this risk that resides with vendors effectively and efficiently through a Reliability Standard.

The NSRF has concerns with being held accountable for a vendor who does not meet the attributes of this proposed Standard, especially for entities that have Low Impact BES Cyber Systems, only. Many of the entities that have Low Impact BES Cyber Systems only, are small (read low risk) entities that may have one Low Impact BES Cyber Systems (maybe a generator, one Transmission substation, or control system). How is the small entity going to stand up to large multi-regional corporate companies (i.e. the vendor), when the vendor will not comply with the requirements of the small entity (and CIP-013-1)? The Low Impact BES Cyber Systems entity will carry all the compliance risks (burden) when they find out that the vendor did not comply with said requirements, regardless of how the entity will ensure that the vendor will comply, a contract, statement of work, etc. If the vendor does agree with supplying proof that is requested, the small entity will then incur **more cost** (read increase costs) to the Low Impact BES Cyber Systems entity by being found non-compliant. The entity may not be able to recoup that cost due to the rate structure of that entity's state commission. This may lead the small entity to assume more risks because the cost is too great and not have a system fully protected. They would be fully compliant by writing their plan and stating everything is low risk and controls are not required.

The guidance document suggests not making these requirements contractual language as it makes negotiations more difficult. This puts us in a poor situation as we are required to do it but don't get NERC support via a requirement in the standard to force the agreement to stipulate it. If it was part of the standard to require it, it would give all Responsible Entities consistent leverage to utilize as all would require it. NERC should provide the areas that should be covered in an agreement in a standard format to provide consistency. The Standard does not make it

clear how any cloud based services may be impacted by this standard. We suggest the SDT to consider how this standard may apply to cloud based systems and provide any relevant clarifications.

We are concerned that CIP-013-1 may oblige entities to purchase equipment that doesn't presently exist and may never exist, and to take actions that are impossible. The standard should at a minimum state that it does not require NERC entities to:	

- impose cyber security measures or reporting on the suppliers of programmable electronic devices (PEDs), - monitor vendors to ensure that they are properly implementing their cyber security programs, - ensure that as-received software and firmware is in the as-shipped condition. - eliminate risk (only mitigation of risk is possible). It would be impractical for vendors to individually negotiate a unique CIP agreement with each purchaser, and the net effect on BES reliability could be negative if the current vendor (for NERC entities with standardization programs) or the vendor with the best product (for competitive bidding) chooses not to develop CIP-013-friendly products due to the burden of compliance. We would support a qualification program administered by a NERC-approved central authority, however, such that entities could address supplier-related issues simply by purchasing CIP-013-certified products. A blanket allowance is needed for entities to take technical feasibility exceptions (TFEs), to address the wide variety of PED types and to address instances of vendors not producing the inputs that entities are supposed to act upon. CIP-013-1 as presently written may create extreme reluctance to enhance plants in accordance with technological developments, which again would be counterproductive regarding long-term BES reliability.

AEP believes the SDT should specifically mention CIP Exceptional Circumstances in the Standard in order to clearly identify that entities would be exempt from complying with CIP-013-1 in the event of a qualifying CIP Exceptional Circumstance. In addition, Order 829 specifically mentions that the Standard should be forward-looking, but CIP-013-1 does not mention it. AEP believes the SDT should revise CIP-013-1 to include a statement in alignment with FERC's directive that this Standard should be forward-looking.

Please modify this standard using the similar 'Applicability' table format used in the earlier standards.

This set of base requirements is would duplicate effort on the part of each entity to evaluate Supply Chain risk for vendors that provide the same product to multiple entities. Some consideration should be given to creating a standard review, application or qualification form that vendors can complete to certify their product and its delivery.

There is significant overlap to CIP-005, 007, 008, 010. If the intent is to impose additional requirements on the procurement process those requirements should be integrated into the appropriate standard to maintain the linkage. Duplication of requirements in another standard will only create confusion and wasted effort for entities to meet CIP compliance.

The requirements as written are not consistent with the standard's stated purpose: "To mitigate cyber security risks to the reliable operation of the Bulk Electric System (BES) by implementing security controls for supply chain risk management of BES Cyber Systems." This purpose statement indicates this standard is intended to address items that should be considered during the procurement/contract negotiations process and included in terms of the contracts. The requirements as written imply that enforcement of the terms of the contract will be audited. The lifecycle management is currently addressed in CIP-005, 007, 008, 010.

The applicability of each of the requirements is not clearly addressed. Standards CIP-002 through CIP-011 clearly define the applicability for each requirement and sub-requirement.

2. Suggest include supply chain certifications such as ISO-28000 and Customs-Trade Partnership Against Terrorism certification as items to ask for in request for purchase.

R1.2.6 states the RE needs to provide	

"*Coordination of remote access controls for (i) vendor-initiated Interactive Remote Access and (ii) system-to-system remote access with a vendor(s);"* While R4 and R5 require *"Controlling vendor-initiated remote access, including system-to-system remote access with vendor(s)."* Different terms regarding obligations for vendor remote access have been used with regard to R1.2.6 than under R4 and R5 (e.g., "coordination" and "controlling:"). We seek clarification on whether that is intentional. If the two terms are intentionally different, more clarity is needed on what different obligations are being imposed between R1.2.6 and R4/R5. If R1.2.6 and R4/5 are not meant to impose different obligations, we suggest use of consistent terms or wording.

CHPD understands that the SDT is under time constraints in addressing Order No. 829, however, CHPD requests that the SDT carefully evaluate each element of the proposed requirements against closely related existing CIP requirements to ensure there is no overlap or duplication of requirements. For example, removal of vendor remote or onsite access (CIP-013, R1.2.2) is perhaps sufficiently if not identically addressed in CIP-004 R5, P5.1 and interactive remote access (CIP-013, R1.2.6) is addressed in CIP-005 R2, P2.1.

CHPD requests adding language comparable to a CIP Exceptional Circumstance for each of the requirements to address circumstances where compliance cannot be achieved due to a vendor's inability to conform to any requirements or an entities policies or plans. Alternatively this could be addressed as an Exemption in Section 4.2.3.

CHPD feels that all standards with requirements that apply to low impact assets should be included in CIP‑003.

As quoted in the Guideline and Examples document, FERC Order no 829 (p21) states "suppliers, vendors and other entities". The Requirement language only references vendors. The SDT should clarify who or what "suppliers" and "other entities" are, how, if at all, they differ from vendors, and how they are addressed in the CIP-013-1 standard.

Requirement R1 applies to BCS and associated EACMS, PACS, and PCA. The other requirements only apply to BCS. This makes sense for R5 since it only applies to low impact systems and EACMS, PACS, and PCA are not low impact terms. However, it is unclear to CHPD if this was intentional for R3 and R4. CHPD requests that the SDT look at the scope of each requirement and verify the intended systems are identified in the language of each.

This makes sense for R5 since it only applies to low impact systems and EACMS, PACS, and PCA are not low impact terms. However, it is unclear to AE if this was intentional for R3 and R4. AE requests that the SDT look at the scope of each requirement and verify the intended systems are identified in the language of each.

Suggest that CIP-013 R1 and R2 are managerial controls and should be the only CIP-013 Requirements. The technical controls in R3 – R4 – R5 should be added to existing CIP Standards. For details, see comments on R3, R4 and R5. This standard should be written using the Applicability Tables used in CIP-003 through CIP-011. As quoted in the Guideline and Examples document, FERC Order no 829 (p21) states references “suppliers, vendors and other entities”. The Requirement language only references vendors. Provide guidance on who or what “suppliers” and “other entities” are, how they differ from vendors and how they are address in the CIP-013-1 standard. Several the CIP-013 requirements are included in existing CIP standards or align more closely with the existing CIP standards that require process(es) or programs. The implementation for the current CIP-013 standard is short, 1 year, yet will required significant resource	

commitments including modifications to existing contracts and agreements to deliver desired solutions. Implementation per Entity Asset and Cyber Asset based upon procured services will be burdensome paperwork exercise to Entities creating focus upon compliance paperwork verses the desired results of improved security for the BES.

Recommend the following:

Moify CIP-013 to define the Cybersecurity Supply Chain program focused on managerial controls for procurement and maintenance.

Move CIP-013 R2 into CIP-003-x R1 with other CIP policies that are reviewed by the CIP Senior Manager. This would also provide alignment across high, medium, and low impact Cyber Assets.

CIP-013 R4 modify CIP-005 R2 , CIP-007 R4 Subpart 4.1.5 and/or CIP-008 R1 part 1.6

Move CIP-013 R5 to CIP-003 R2

CHPD understands that the SDT is under time constraints in addressing Order No. 829, however, CHPD requests that the SDT carefully evaluate each element of the proposed requirements against closely related existing CIP requirements to ensure there is no overlap or duplication of requirements. For example, removal of vendor remote or onsite access (CIP-013, R1.2.2) is perhaps sufficiently if not identically addressed in CIP-004 R5, P5.1 and interactive remote access (CIP-013, R1.2.6) is addressed in CIP-005 R2, P2.1.

CHPD requests adding language comparable to a CIP Exceptional Circumstance for each of the requirements to address circumstances where compliance cannot be achieved due to a vendor's inability to conform to any requirements or an entities policies or plans. Alternatively this could be addressed as an Exemption in Section 4.2.3.

As written, implementation of this draft standard may degrade rather than improve reliability by interfering with the ability to respond and recover from BES cybersecurity events. The draft standard also encourages the use of a monoculture of products allowing broader damage from a single zero-day vulnerability.

The American Council of Engineering Companies (ACEC) -the business association of the nation's engineering industry - wants to convey the industry's perspectives and concerns over the development of this new cyber security supply chain rule mandated by the Federal Energy Regulatory Commission (FERC).

ACEC member firms, numbering more than 5,000 firms representing over 500,000 employees throughout the country, are engaged in a wide range of engineering works that propel the nation's economy, and enhance and safeguard America's quality of life. Council members are actively involved in every aspect of the energy marketplace.

Supply chain cyber security is of growing concern to all our members. While we believe that present cyber security controls and voluntary practices are highly effective, input by engineering service providers would assist NERC/FERC in producing a more effective approach in minimizing the impacts on competition, risk allocation, and pricing.

In short, ACEC is in agreement with most of the comments of the owners, operators, vendors and suppliers that have formally participated in this Standard development. We fully appreciate the concerns over how risk can be adequately managed under any proposed standard. Our member firms' reputations depend upon professional performance and innovation in an atmosphere of collaboration. However, we are concerned that the supply chain language in this Standard will not support, and may actually impair, broad-based cost-effective infrastructure security and grid reliability

FirstEnergy recommends that the SDT take additional time in preparing a draft supply chain Standard that properly separates “supply chain” Requirements from additional operational and maintenance Requirements. Operational and maintenance Requirements should be added to	

the existing CIP Standards where the subject protections are already addressed. In addition, any Requirements applicable to Low Impact BES Cyber Systems should be placed in CIP-003 as has been established as a practice for all other low impact requirements. It should also be noted that certain expectations of these Requirements have economic implications to entities of all sizes. These Requirements could result in limiting the flexibility of an entity to obtain cyber assets from third-party distributors at a significant discount. For some entities, the additional costs could have an impact on their ability to remain for example, an economically viable generating unit. While probably not something that by itself impact the continued operation of a generating unit, the additional costs associated could be an influencing factor in keeping BES generating unit in-service.

Basin Electric has concerns with being held accountable for vendors who not meet the attributes of this proposed Standard. Basin Electric prefers existing CIP standards be modified to satisfy the order. With the current FERC Commission lacking quorum, the timeframe to add commission members and the resulting backlog from the delay, it would appear the FERC Commission is not in a position to act upon a hastily constructed new standard. Basin Electric suggests NERC request an extension of time to modify existing standards to meet the order. Basin Electric suggests CIP-013 follow the table structure used in the existing enforceable CIP standards including the Part, Applicable Systems, Requirements and Measures.

"This standard is forward looking in that it does not apply to current vendor relationships, systems, and processes, and does not require entities to renegotiate currently effective contracts in order to implement." - Verbiage to this effect needs to be part of the standard.

Vectren would like definitions of security breaches, vendor-related cyber security incidents, security event, and vendor security event.

Vectren respectfully requests FERC reconsider the timeline for this standard to allow additional time to identify the risks, and consequently, the appropriate controls. This would allow the SDT to outline the requirements so utilities are able to comply.

Vectren is committed to the safety and reliability of the BES and committed to compliance excellence. We appreciate the efforts of the Standard Drafting Team and will be glad to provide any additional detail upon request. Thank you, again, for the opportunity for Vectren to provide comments on this draft standard.

Summary of comments direction:

1. No “plans.” (Delete R1 and R2). Order 829’s four objectives did not include creating “plans.”

2. All four of the directives either direct or use examples of specific operational cyber security controls which are best addressed as revisions to CIP-002 through -011. (Delete R3-5).

3. We recommend the CIP-013 SDT request NERC to assign the CIP revisions SDT to assist the CIP-013 team to draft the technical revisions for each of the four directives in CIP-002 through CIP-013. The CIP revisions SDT has met their Order 822 directive that had a deadline. To get the best standards for reliability and meet the FERC Order 829 directives' deadlines, NERC and industry should reprioritize SDT teams' work and resources. Result: No CIP-013 standard. Revised CIP-002 through -011 standards. Other comments: On the one hand Order 829 states intent to respect FPA section 215 jurisdiction by only addressing the obligations of responsible entities. A Reliability Standard should not directly impose obligations on suppliers, vendors or other entities that provide products or services to responsible entities. Yet, in paragraph 59, Order 829 states, "The new or modified Reliability Standard must address the provision and verification of relevant security concepts in future contracts for industrial control system hardware, software, and computing and networking services associated with bulk electric system operations." Contracts are bi-lateral and as such impose obligations on both parties, in direct contradiction to not imposing obligations on suppliers, vendors or other entities. Paragraph 59 is indirectly imposing obligations on suppliers, vendors or other entities that provide products or services to responsible entities. If the entity chooses, contracts can be a tool in "how" they deliver the "what" for the security objective. However, the registered entity's compliance has to be measured on achieving the security objective, not on contract terms. We will not support any standard that prescribes contract terms and makes contract terms a measure of an entity's compliance. Entities have been achieving the CIP-004 security objectives for background checks, training and access revocations since CIP version 1 without the prescription of "how" it had to be done (without making contract terms a measure of their compliance). We strongly agree with the Midwest Reliability Organization comments.

• During the Assess/Plan, Procure/Acquire phases of the Supply Chain process, separate requirements for standalone Standard (CIP-013) should be developed. For the deployment and operational aspects of the Supply Chain, appropriate requirements should be incorporated into the existing CIP Standards. It is recommended that this SDT collaborate with the CIP-002-CIP-011 SDT for language that can be used until R3 – R5 can be moved to their appropriate operational standards. • All measures sections will need to be updated to reflect any changes that are made to the requirements. • Dominion recommends that “remote access” should be changed to “electronic remote access” throughout the proposed CIP-013-1.

Comment
The need to have supply chain risk management is agreeable; however, in its current form, CIP-013-1 poses a great challenge and burden to SCE&G and other Responsible Entities for various reasons, many of them documented in the Unofficial Comment Form. SCE&G recommends that CIP-013-1 include a modified R1 and R2 only, and not include R3 through R5. Requirements R1 and R2 focus on the supply chain and will suffice as an initial implementation step of supply chain risk management. The remaining requirements are operational obligations that need to be integrated into existing NERC CIP Standards.

Comment	
In the Purpose, change “security controls” to “procurement and operational controls” as presented in the materials. CenterPoint Energy request that the SDT format CIP-013 like the other CIP Standards, a table design, if possible. CenterPoint Energy suggests more collaboration between the CIP Modifications SDT and the Supply Chain SDT to help eliminate overlap and better align with existing CIP requirements. In general, the SDT should consider the operational impacts that this standard could have on the industry. Flexibility is necessary.

HQT voted Negative and would like to see the following matters to be addressed:	

-CIP-013 should move forward with only R1 and R2 since they are mostly procurement related-some concern is being expressed that the requirements for having a supply chain risk management plan seem to a cover low medium and high BES Cyber assets as well as allowing entities to assess their own risk. Further clarification and perhaps some third party verification would be beneficial. -Contractual issues could exist. Although the FERC order doesn't require abrogation of contracts there is some concern that there could end up being multiple contracts in place, those newly negotiated and the existing ones. Confusion exists between use of terms vendor and suppliers in the draft standard and the Guidance section. -Concerns exist regarding authentication on multiple levels and how vendors and their manufacturers may combine hardware and software into their products and how there could meaningful verification and authentication -There are a number of areas where time seems to be an issue as it relates to implementation -Use of "applicability tables" as they appear in other CIP standards would clarify the requirements to alleviate compliance concerns - R3, R4 and R5 should move into existing CIP Standards to avoid P81 issues (redundancies) and ease implementation for Entities and improve auditability efficiencies.

Comment	
OUC understands that the SDT is under time constraints in addressing Order No. 829, however, OUC requests that the SDT carefully evaluate each element of the proposed requirements against closely related existing CIP requirements to ensure there is no overlap or duplication of	

requirements. For example, removal of vendor remote or onsite access (CIP-013, R1.2.2) is perhaps sufficiently if not identically addressed in CIP-004 R5, P5.1 and interactive remote access (CIP-013, R1.2.6) is addressed in CIP-005 R2, P2.1.

OUC requests adding language comparable to a CIP Exceptional Circumstance for each of the requirements to address circumstances where compliance cannot be achieved due to a vendor's inability to conform to any requirements or an entities policies or plans. Alternatively this could be addressed as an Exemption in Section 4.2.3.

In conclusion, ATC has concern that, despite what is a well-intended attempt by a highly qualified SDT to address the directives of FERC Order 829, CIP-013-1 is its current form is ultimately serving as an vehicle to revise or expand the scope and requirements to several currently approved and enforceable CIP Cyber Security Reliability Standards without affording the industry due process in accordance with the NERC Rules of Procedure for those modifications. 1.) Where existing Reliability Standards and Requirements meet the intent of CIP-013-1 and the FERC Order 829 directives, the existing Reliability Standards should be leveraged to accomplish the objective instead of creating a duplicative standard. 2.) Where Reliability Standards and Requirements may not go far enough to meet a given objective as it relates to vendors or suppliers, consideration should be given to modifying those existing Reliability Standards and Requirements, or perhaps investing time toward the further exploration of leveraging available standardized industry frameworks or practices that meet the objectives in an ever changing threat landscape as opposed to a reliability standard that a.) may be ill-equipped to keep pace with emerging threats and b.) perhaps carry the risk of hindering a Registered Entity's ability to be timely and nimble in addressing those threats in order to maintain compliance with a requirement(s) that has been rendered irrelevant. The creation of a new Reliability Standard should not supersede, contradict, expand,

amend, or otherwise effectively revise other currently approved and enforceable CIP Cyber Security Reliability Standards. Those Standards exposed to this condition are cited in other comments and include, at a minimum the below listed five (5) CIP Standards:

- CIP-002-5.1
- CIP-003-6
- CIP-004-6
- CIP-005-5
- CIP-007-6

In conclusion, the above concerns related to redundancy or contradiction to approved and enforceable CIP Standards, the cited expansion to the FERC directives, and the confusion, inconsistency, and broad sweeping language that is at odds with the intent of both enforceable CIP Standards, the effort of paragraph 81, and FERC Order 829 supports the wisdom and caution within FERC Commissioner's (Cheryl A. LaFleur's) dissent to FERC Order 829. LaFleur's dissent to FERC Order 829. (P. 67) issued on July 21, 2016, cautions that "**…effectively addressing cybersecurity threats in supply chain management is tremendously complicated, due to a host of jurisdictional, technical, economic, and business relationship issues**." In this dissent, LaFleur acknowledges that the threat of inadequate supply chain risk management procedures poses a very real threat to grid reliability; and while LaFleur offers full support of the Commission's continued attention to this threat, LaFleur's **"…fear that the flexibility** *[within FERC Order 829]* **is in fact a lack of guidance and will therefore be a double-edged sword.**" is demonstrable in this first draft of CIP-013, and further evidence that FERC Order 829 may have been premature thereby causing a highly qualified and well-intended SDT to be ill-equipped to "**…translate general supply chain concerns into a clear, auditable, and enforceable standard within the framework of section 215 of the Federal Power Act.**" With Cheryl A. LaFleur's recent appointment to FERC's Acting Chairman on January 23, 2017, ATC respectfully encourages NERC and the SDT to consider if there is an opportunity for FERC to revisit the need for the CIP-013-1 Supply Chain Reliability Standard and to reevaluate the appropriateness and viability of FERC Order 829 and whether or not the SDT should move forward or if FERC Order 829 should be rescinded in favor of the industry leveraging the existing CIP-002 – CIP-011 approved and enforceable reliability standards in combination with the risk-based industry standards and frameworks as an alternative approach to drafting this new Reliability Standard. ATC thanks the SDT for consideration of our positions.

1. We believe in finding a beneficial multi-sector solution that will lower costs, encourage innovation, and support among multisector vendors.

2. The current standard would create a compliance burden for entities that are already resource constrained.

3. We believe that the SDT should focus on a supply chain management standard that is designed to:

· Manage in addition to eliminating risk;

· Ensure that operations are adapting to constantly evolving threats;

· Be aware of and responsive to changes within their own organization, programs, and the supporting information systems; and

· Adjust to the rapidly evolving practices of the electricity sector's supply chain.

4. Though the current language would certainly raise standards across the entirety of the software industry, it could result in isolation of the electricity sector and hamper growth and innovation among industrial control vendors.

5. We thank you for the opportunity to comment.

Wendy Center - U.S. Bureau of Reclamation - 5	
Answer	
Document Name	
Comment	
Reclamation commends the SDT for the draft that was provided for a new and complex standard in a short amount of time. Reclamation recommends a more simplified format of the proposed standard. Reclamation believes that the objectives and intent and of FERC Order 829 can be met without spelling out each objective as a separate requirement. As presently written, the first draft contains repeating elements (such as access, authentication, product delivery, etc.) in different requirements. The simplified approach described in the answers to Questions 1 through 5 above would eliminate redundancy.

Shawn Abrams - Santee Cooper - 1, Group Name Santee Cooper	
Answer	
Document Name	
Comment	
Santee Cooper understands that the SDT is under time constraints in addressing Order No. 829, however, the SDT should carefully evaluate each element of the proposed requirements against closely related existing CIP requirements to ensure there is no overlap or duplication of	

requirements. For example, removal of vendor remote or onsite access (CIP-013, R1.2.2) is perhaps sufficiently if not identically addressed in CIP-004 R5, P5.1 and interactive remote access (CIP-013, R1.2.6) is addressed in CIP-005 R2, P2.1.

Santee Cooper requests adding language comparable to a CIP Exceptional Circumstance for each of the requirements to address circumstances where compliance cannot be achieved due to a vendor's inability to conform to any requirements or an entities policies or plans. Alternatively this could be addressed as an Exemption in Section 4.2.3.

Santee Cooper recommends that all standards with requirements that apply to low impact assets be included in CIP‑003.

As quoted in the Guideline and Examples document, FERC Order no 829 (p21) states "suppliers, vendors and other entities". The Requirement language only references vendors. The SDT should clarify who or what "suppliers" and "other entities" are, how, if at all, they differ from vendors, and how they are addressed in the CIP-013-1 standard.

Requirement R1 applies to BCS and associated EACMS, PACS, and PCA. The other requirements only apply to BCS. This makes sense for R5 since it only applies to low impact systems and EACMS, PACS, and PCA are not low impact terms. However, it is unclear if this was intentional for R3 and R4. Santee Cooper requests that the SDT look at the scope of each requirement and verify the intended systems are identified in the language of each.

Santee Cooper recognizes the importance of regulatory bodies and the regulatory industry jointly addressing issues concerning cybersecurity and the reliability of the bulk electric system. In this standard, Santee Cooper agrees with other industry comments that many of the gaps addressed in CIP-013 should be modified in other standards and not established as a new standard nearly duplicative of (or worse, in conflict with) other standards. FERC provided NERC the opportunity to either develop a new or modified standard, and Santee Cooper urges the SDT to pursue the latter option as much as is appropriate. Requirements in CIP-013 to address gaps remain must be carefully crafted to avoid creating an ineffective, unauditable and unenforceable standard. Additionally, the short timeframe for submission of this standard and implementation period restricts the utility industry from contributing meaningful and thoughtful comments that would better focus on supply chain concerns that does not advance the security of the grid, as set out by now-Chairperson LaFleur in her dissent to Order 829.

1) This standard should be written using the Applicability Tables used in CIP-003 through CIP-011.

2) As quoted in the Guideline and Examples document, FERC Order no 829 (p21) states references "suppliers, vendors and other entities". The Requirement language only references vendors. Provide guidance on who or what "suppliers" and "other entities" are, how they differ from vendors and how they are address in the CIP-013-1 standard.

3) Several the CIP-013 requirements are included in existing CIP standards or align more closely with the existing CIP standards that require process(es) or programs. The implementation for the current CIP-013 standard is short, 1 year, yet will required significant resource commitments including modifications to existing contracts and agreements to deliver desired solutions. Implementation per Entity Asset and Cyber Asset based upon procured services will be burdensome paperwork exercise to Entities creating focus upon compliance paperwork verses the desired results of improved security for the BES.

Recommend the following:

a. Modify CIP-013 to define the Cybersecurity Supply Chain program focused on managerial controls for procurement and maintenance.

b. Move CIP-013 R2 into CIP-003-x R1 with other CIP policies that are reviewed by the CIP Senior Manager. This would also provide alignment across high, medium, and low impact Cyber Assets.

c. CIP-013 R4 modify CIP-005 R2 , CIP-007 R4 Subpart 4.1.5 and/or CIP-008 R1 part 1.6

d. Move CIP-013 R5 to CIP-003 R2

Leonard Kula - Independent Electricity System Operator - 2	
Answer	
Document Name	
Comment	

While there are different ways to approach the complex issues of the supply chain risk, a proactive approach to address the issue can only help improve the industry's security posture. The difficulty in addressing the complexities requires additional evaluation to address the issues impacting both the development and implementation of solutions. Similar to CIP-014, the development of Supply Chain Risk Management plans and procurement process proposed under R1 and R2 may be appropriate within a new or revised Reliability Standard. The technical controls proposed for CIP-013 R3 and R4 may be better addressed within existing CIP Standards. The IESO abstains from commenting on R5 but believes integration into existing CIP Standards might be appropriate, especially since CIP-003 Attachment 1 already is comprised of a security plan.

This requirement puts a substantial responsibility on the Responsible Entity without any authority or recourse if the vendor is unwilling or unable to agree. This is applicable to Requirements 1, 3, 4, and 5. The plan should allow for risk acceptance and leverage of an exception process. To address these concern, the drafting team should include some provisional or exception language to protect Responsible Entities such as use of a Technical Feasibility Exception (TFE). NERC's Appendix 4D to the Rules of Procedure provide for a basis of approval of a TFE beyond strict technical limitations of a system. Reference Section 3.0 of the appendix for more information.

The Standard uses "supplier" and "vendor" throughout, interchangeably. The terms should be consistent throughout to avoid confusion.

Ginette Lacasse - Seattle City Light - 1,3,4,5,6 - WECC, Group Name Seattle City Light Ballot Body	
Answer	

Document Name	CIP-013 Comment Mar 2 revision SCL 2017-3-6.docx

Comment

The attached document has comments compiled for all the questions. Please note that the BOLD paragraphs below (YELLOW highlighted in attachment) are uniquely Seattle City Lights. The un-highlighted comments were developed in collaboration with other entities and trade organizations such as LPPC. These comments may be like those submitted by other entities but not necessarily. City Light recognizes the challenges facing the SDT and appreciates the efforts the SDT is placing into working towards developing a solid standard.

Seattle City Light understands that the SDT is under time constraints in addressing Order No. 829, however, Seattle City Light requests that the SDT carefully evaluate each element of the proposed requirements against closely related existing CIP requirements to ensure there is no overlap or duplication of requirements. For example, removal of vendor remote or onsite access (CIP-013, R1.2.2) is perhaps sufficiently if not identically addressed in CIP-004 R5, P5.1 and interactive remote access (CIP-013, R1.2.6) is addressed in CIP-005 R2, P2.1.

Seattle City Light requests adding language comparable to a CIP Exceptional Circumstance for each of the requirements to address circumstances where compliance cannot be achieved due to a vendor's inability to conform to any requirements or an entities policies or plans. Alternatively, this could be addressed as an Exemption in Section 4.2.3.

Seattle City Light feels that all standards with requirements that apply to low impact assets should be included in CIP-003.

As quoted in the Guideline and Examples document, FERC Order no 829 (p21) states "suppliers, vendors and other entities". The Requirement language only references vendors. The SDT should clarify who or what "suppliers" and "other entities" are, how, if at all, they differ from vendors, and how they are addressed in the CIP-013-1 standard.

Requirement R1 applies to BCS and associated EACMS, PACS, and PCA. The other requirements only apply to BCS. This makes sense for R5 since it only applies to low impact systems and EACMS, PACS, and PCA are not low impact terms. However, it is unclear to Seattle City Light if this was intentional for R3 and R4. Seattle City Light requests that the SDT look at the scope of each requirement and verify the intended systems are identified in the language of each.

As discussed in comments to R1 above, Seattle City Light requests that the title of the standard be changed to "Vendor Risk Management" to clarify that the scope of the required activities relate to the relationships among a utility and its vendors. In common usage, the term "supply chain risk management" encompasses a much broader scope of concerns, including quality control and verification of third-party

suppliers as well as addressing sole-source and international dependencies. Although the FERC Order and SDT white paper cite concerns about both vendor risk and supply chain risk, the requirements actually proposed in CIP-013 address vendor risk.

Seattle City Light recognizes the importance of regulatory bodies and the regulatory industry jointly addressing issues concerning cybersecurity and the reliability of the bulk electric system. In this standard, City Light agrees with other industry comments that many of the gaps addressed in CIP-013 should be modified in other standards and not established as a new standard nearly duplicative of (or worse, in conflict with) other standards. FERC provided NERC the opportunity to either develop a new or modified standard, and City Light urges the SDT to pursue the latter option as much as is appropriate. Requirements in CIP-013 to address the gaps that remain must be carefully crafted to avoid creating an ineffective, unauditable and unenforceable standard. Additionally, the short timeframe for submission of this standard and implementation period restricts the utility industry from contributing meaningful and thoughtful comments that would better focus on supply chain concerns. Thus this standard "does not advance the security of the grid," as set out by now-Chairperson LaFleur in her dissent to Order 829.

Comment	

We suggest that the standard should have two requirements only.

R1 could require the entities to identify risks, evaluate controls (at minimum the controls itemized in FERC Order), and implement controls based on the acceptable level of risk to address the four objectives in FERC Order and mitigate risks stated in the Order.

R2 could be the periodic review and approval of R1 by CIP Senior Manager.

The applicability could be to all BES Cyber Systems essential for operation of BES. Entities should consider impact rating of High, Medium and Lows when evaluating necessary controls.

Comment for consideration in the RSAW

For the RSAW and under Requirement 1 in the section called “Note to the Auditor”, We recommend adding that “Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan” as stipulated in the Rationale for Requirement 1.

EEI members prefer use of the applicability tables, especially for R3 and R4.

EEI commends the work done by the SDT and NERC on this difficult task. CIP-013 is a challenging standard given it is focused on minimizing risk introduced by third parties that the Responsible Entities have little control over. In particular, we are reminded of Acting Chairman LaFleur's

dissenting statement “effectively addressing cybersecurity threats in supply chain management is tremendously complicated, due to a host of jurisdictional, economic, and business relationship issues.” In addressing our comments and others, we recommend that the SDT focus on the security objectives and what the Responsible Entities can do in procurement to minimize risk to the bulk-power system. Although cybersecurity is a risk, other risks such as reliability may outweigh the need for certain cybersecurity focused requirements. Cybersecurity is about managing risk, which must be balanced against a number of factors and for the electricity subsector, keeping the lights on is key.

We appreciate the significant efforts of the SDT to develop this draft standard on difficult subject matter in such a short amount of time. However, based upon this initial draft, it is evident that additional time is necessary for the SDT to develop an effective standard addressing supply chain security risks. We suggest that the SDT develop a formal recommendation to NERC staff requesting that NERC file for an extension of time to collect additional stakeholder feedback in order to develop a more effective standard. In general, we request that the SDT consider our comments in question 1 that supply the following framework for a supply chain security standard: FERC's directives in paragraphs 43 through paragraph 62 summarized a general framework for this new Standard as outlined: R1: Develop a plan to include security controls for supply chain management that include the following four specific security objectives in the context of addressing supply chain management risks: R1.1 Security objective 3 (*information system planning*)	

R1.2 Security objective 4 (*vendor risk management and procurement controls*)

R1.3 Security objective 1 (*software integrity and authenticity*)

R1.4 Security objective 2 (*vendor remote access*)

R2: Implement the plan specified in R1 in a forward looking manner.

R3: Review and update, as necessary its supply chain cyber security risk management plan(s) specified in R1 at least once every 15 calendar months

R3.1 Evaluation of revisions…

R3.2 Obtaining CIP Senior Manager or delegate approval.

GTC feels this framework outlined above satisfies Order 829 in the context of addressing supply chain management risks, completely. Although FERC expressed some operational scenarios of existing CIP standards not explicitly addressing supply chain risks, the point of FERC's summary was still in the context of addressing supply chain risks and not additional operational controls as presented by the SDT.

From a clarity standpoint, we urge the drafting team to consider limiting the structure of CIP-013-1 to the supply chain horizon which ends at the delivery of products/services to the acquirer in accordance with NIST SP 800-53 r4 rather than a holistic BES Cyber System Life Cycle approach chosen. GTC submits that the operations and maintenance of BES Cyber systems are already addressed in existing standards. Lastly, FERC provides NERC discretion per paragraph 44 the option of modifying existing Reliability Standards to satisfy the directive, so if the SDT believes additional operational gaps still exist, then GTC prefers NERC identify these risks, and explain to FERC NERC's intent to invoke operational changes by modifying existing CIP requirements with the submission of a "supply chain horizon contained" CIP-013-1.

Lastly, GTC recommends the SDT develop a Guidelines and Technical Basis section to be included within the standard for clarifications of the following…" ***Who is the vendor? Is it the manufacturer/software company, the reseller the hardware/software is acquired from, the shipping company, the integrator, others? For temporary staff, is the contract employee a vendor?***"

The intent of FERC Order 829 is noble, but seems to be directed to the wrong audience. The risks of compromised hardware and software impacts much more than ICS, in that it extends to all our processing and communication systems. With the advancement of IoT, the spirit of FERC Order 829 needs to be moved to an even higher national focus. In the meantime, NERC should focus on helping registered entities improve its controls culture within the activity environment it can directly impact. Thanks.

By not modifying the existing CIP Standards where there is overlap of requirement, there is a distinct possibility of inconsistent policies and procedures. Furthermore, should the Registered Entity choose to reference its other Standards compliance documents, there is a possibility of creating circular references or “spaghetti” linkages.

1) Suggest that CIP-013 R1 and R2 are managerial controls and should be the only CIP-013 Requirements. The technical controls in R3 – R4 – R5 should be added to existing CIP Standards. For details, see comments on R3, R4 and R5.

2) This standard should be written using the Applicability Tables used in CIP-003 through CIP-011.

3) As quoted in the Guideline and Examples document, FERC Order no 829 (p21) states references “suppliers, vendors and other entities”. The Requirement language only references vendors. Provide guidance on who or what “suppliers” and “other entities” are, how they differ from vendors and how they are address in the CIP-013-1 standard.

4) Several the CIP-013 requirements are included in existing CIP standards or align more closely with the existing CIP standards that require process(es) or programs. The implementation for the current CIP-013 standard is short, 1 year, yet will required significant resource

commitments. Implementation per Entity Asset and Cyber Asset based upon procured services will be burdensome paperwork exercise to Entities creating focus upon compliance paperwork verses the desired results of improved security for the BES. Recommend the following: a. Modify CIP-013 to define the Cybersecurity Supply Chain program focused on managerial controls for procurement and maintenance. b. Move CIP-013 R3, to CIP-010 R1. c. CIP-013 R4 modify CIP-005 R2 , CIP-007 R4 Subpart 4.1.5 and/or CIP-008 R1 part 1.6 d. Move CIP-013 R5 to CIP-003 R2

This Standard implies a high degree of compliance audit and enforcement authority for the Regions, which we have not seen implemented. From our experience with CIPv5 compliance exceptions, the objectives of the Reliability Assurance Initiative to provide risk-based process efficiencies have not been met. Entities must still use the costly self-report process for anything short of perfection, and regional auditors are not given latitude to make risk-based decisions. CIP-013-1 as drafted cannot work as intended until entities can work with regional auditors to quickly assess risk.

The intent of FERC Order 829 is good, but seems to be directed to the wrong audience. The risks of compromised hardware and software impacts much more than ICS, but extends to all our processing and communication systems. With the advancement of IoT, the spirit of FERC Order 829 needs to be moved to an even higher national focus. In the meantime, NERC should focus on helping registered entities improve its controls culture within the activity environment it can directly impact. Thanks.

Note of Appreciation We recognize the constraints imposed on the Standard drafting process by the language of the Commission's Order and its directives. We also would highlight Commissioner LaFleur's caution--that the Order was premature—may be coming to fruition. In consideration of both points, we are appreciative of the Standard Drafting Team's continuing work on the CIP Cyber Supply Chain Standard and its efforts to overcome the challenges it presents. Thank you. Kansas City Power and Light Company

The current version of CIP-013-1 is vague. Though flexibility is needed, the current version does not provide enough clarification to Registered Entities on the expectations required under the Standard and will therefore fail to mitigate cyber security risks to the BES.

We have several questions and concerns about what the phrases "vendor-initiated" and "system-to-system remote access" used in several requirements exactly mean. 1) Can the SDT please clarify what is meant by “vendor-initiated”. For example, if we (the customer) are having an operational issue and contact the vendor for support, is that support session still considered “vendor-initiated”, or would that session not be in scope because it is prompted by the customer’s request? Alternatively, if we initiate the remote access session with the vendor and turn over control to them, is that session still considered "vendor-initiated"? 2) We are unclear what the phrase "system-to-system" means. Please define or give examples of what would be considered a “system-to-system remote access with a vendor”. We are having trouble understanding how we might apply R4.1-4.3 and other associated requirements if there is no human interaction. 3) In our experience, vendor or third-party remote assistance is typically needed in times where there is a problem that could not be resolved by internal staff. We are concerned with the monitoring requirement (4.2), especially in situations where the system issue is having a real-time impact on operations and requires speedy trouble-shooting and resolution. There may not be enough internal resources available to respond to the situation and also actively monitor the vendor’s session. Additionally, the use of the phrase “unauthorized activity” is problematic, as the situation may not allow for a step-by-step explanation from the vendor as to what steps they are taking to troubleshoot the issue. Finally, how would one prove in an audit that the session was monitored and that no unauthorized activity occurred?

Tri-State strongly believes the directives issued in Order No. 829 should be addressed by revising existing CIP standards, so that entities have all the relevant requirements together. We are concerned that if the existing standards are not revised to incorporate the new requirements, we will recreate the confusion and complexity that came with v3 standards, which in many cases led to non-compliance. We encourage NERC to request more time from FERC to get this right the first time and to avoid future projects, if extra time is needed, and instead allow the industry to focus more time and resources on getting cyber security right.

We appreciate the hard work of the standard drafting team in putting together this first draft standard and supporting documents. This is a very different type of standard than usual that asks entities to address risks that may be introduced by activities outside of their control. Although we have concerns with this first draft, we feel confident that the team can work through the issues and come up with a reasonable set of requirements.

If low impact Cyber Systems are included in any of the requirements, the requirements should be less stringent than those for high and medium since the risk to the BES is considerably less. Some of the other CIP standards use applicability tables to more clearly illustrate the

specific requirements for each of these impact levels (see CIP-004 for an example). If there are any variations in requirements for the impact levels – especially if low impacts are included in this standard - we would like to see the tables used. They provide consistency with the way the other standards are written, they're easier to navigate, and they can illustrate the risk-based nature of the standard.

The drafting team should consider addressing some sort of vendor certification process to enable entities to select vendors that meet all of the security requirements stated within this standard. This will enable entities to rely on these vendors while allowing the entity to expeditiously address security vulnerabilities and other risks to operations.

Comment	

At the outset, Southern Company wishes to first note for the record its belief that Requirement R3 and Requirement R4 should be removed from the CIP-013 standard. As explained below, it is either duplicative of R1, duplicative of existing requirements in CIP-004-6, CIP-005-5, CIP-007-6, CIP-008-5, and CIP-010-2, and is inappropriate for a standard focused on the Supply Chain time horizon.

First, from the perspective of a supply chain procurement time horizon, verification of the integrity and authenticity of software and firmware is already addressed under Requirement R1, R1.2.3. Specifically, R1 requires a risk management plan that addresses controls for mitigating cybersecurity risks for industrial control system vendor products and services, and the plan must address methods to evaluate controls to address those risks (R 1.2) including "process(es) for verifying software integrity and authenticity of all software and patches that are intended for use". (R 1.2.3) Specifically, (assuming R1 covers only the procurement time horizon), then R3's requirement -- to implement "one or more documented processes" to address the verification of the integrity and authenticity of the following software and firmware before being placed in operation on high and medium impact BES Cyber Systems -- is arguably covered by R1.2.3's requirement to have a process to do the same with respect to all industrial control system software and patches.

Second, to the extent R1 or R3 could be read to extend to verification of authenticity/integrity beyond the procurement and into the operational phase, such a broad interpretation should be outside of the scope of the CIP-013 supply chain standard, and would be more appropriately addressed in a separate proceeding to look specifically at operational standards CIP-002 through CIP-010. Specifically, patch monitoring and management is already described in CIP-007, yet little consideration appears to have been given to the burdensome impacts that might result on CIP-007 compliance if CIP-013 R3 compliance is layered on top in the operational time horizon, rather than being limited to the procurement phase (and thus covered in CIP-013 R1). The stringent 35 day cycles required within CIP-007-6 R2 will be significantly impacted by the proposed language in R3, placing Responsible Entities in a position of compromising compliance with one standard by trying to maintain compliance with another. The supply chain NOPR and final were not originally focused on these types of operational controls, and any such exploration of operational risk issues are more appropriately explored separately and outside of the supply chain proceeding. Moreover, if this standard is intended to cover all aspects of all lifecycle stages (from planning to procurement to production to retirement, i.e., cradle to grave) for all devices and vendors – that is an expansive initiative that overlaps with multiple CIP standards and would require a timeframe for development that is much longer than one year.

Similarly and for the above reasons, Requirement R4 is also considered not necessary and should be removed. The proposed requirement for "authorization of vendor remote access" is already explicitly required in CIP-004-6 R4; logging and monitoring of vendor remote access is already covered in CIP-005-5 R1 and CIP-007-6 R4; and response to "unauthorized activity" by vendors is already covered in CIP-008-5. The modifications provided above and suggested under R4 are to address the Responsible Entity having the capability to quickly disable vendor

remote access sessions, which again we strongly recommend the SDT consider incorporating into CIP-005 as a new requirement addressing this potential security improvement. Overall, industry was not given an adequate chance to express this in the FERC proceeding leading to Order 829 because the NOPR expressed proposed directives at a very broad and high level whereas the Final Rule contained much more prescriptive directives. Southern Company agrees with the July 21, 2016 statement provided by Acting Chairman LaFleur in this proceeding that "the more prudent course of action" for NERC, industry, and stakeholders would have been to issue a supplemental NOPR to provide input on the more prescriptive directives contained in this Final Rule. Southern Company would encourage an opportunity for input on such larger matters once the standard is submitted to the Commission for approval. Having said that, Southern Company recognizes and appreciates that, at this stage of standard development, NERC is bound to comply with the final rule's directives in Order 829. Therefore, while wishing to preserve for the record its opinion that Requirement R3 and R4 should be removed, Southern Company offers the comments and language contained herein to improve the standard from its currently drafted version.

Foundation for Resilient Societies Comments on Draft Standard 2016-03, Cyber Security Supply Chain Risk Management, NERC CIP 013-01	
1. Vote “NO” on approval of the draft.	

Rationale: The proposed CIP-013-01 standard is onerous and not cost-effective. It excpectss too much of individual registered entities, which should not be the primary organizations responsible for strengthening the integrity of the cyber supply chain.
Starting at the foundry level, it is essential to assure the integrity of chip design, manufacture and operations. And control of firmware by entities that are committed to protect the national security interests of the United States and Canada. The current practice of purchasing control and telecommunication systems from the lowest-cost supplier may be too risky and too imprudent to attain greater integrity in cyber supply chains. It is unreasonable to expect that some 1400 separate electric utilities should be responsible for major changes in the development and regulation of cyber supply chain systems.
The recent re;port on Cyber Deterrence by the Defense Science Board, released on February 28, 2017, seeks tailored initiatives to enhance deterrence of cyber attacks on critical infrastructures. This Report recognizes that a key element of deterrence is to improve defenses, so the payoffs to foreign adversaries will be reduced. Meanwhile, the Trump Administration has underway a review of cyber policies and strategy. If the Administration will support initiatives to strengthen cyber supply chains that involve indigenous U.S. design, production, operation, and integrity testing for the entire cyber supply chain, any final NERC-FERC standard responsive to Order No. 829 should await opportunities to be presented by the Administration after its policy review.
As a result of this overburden on registered entities, the Standard Drafting team -- not surprisingly -- has drafted CIP-013-1 containing too many exceptions, qualifications, and outstanding conflicts to form the foundation for the most-difficult process of managing the risks that derive from vulnerabilities in products marketed to the industry in a global and highly competitive environment. If some foreign governments subsidize their hardware systems, is it imprudent to always accept the lowest price products that place our cyber supply chains at risk?
The present draft standard makes the probability of successful discrimination exceedingly low. The investment of time and money by utilities and the industry will be very high, and certainly not worth the risks of failing compliance by entities and their procurement selections that are even further removed from technical competencies essential to their task.
Implementation as written will only encourage a shell game that will delay real solutions to the Supply Chain vulnerabilities and provide false assurances that must be addressed collectively by the industry, by state and by federal authorities. The latter must address the increasing failures of vendors to design secure products through market motivations and penalties. This problem has been successfully addressed in many other industries where serious safety issues existed.

2. Requirement R1

a. Any deep examination of the four objectives of R1 reveals substantial gulfs with the realities of Supply Chain issues.
   - Risks can never be assessed in the absence of vulnerability assessments. None are called for. And vulnerabilities range from individual components to full systems. End-to-end control center to remote unit network assessments are needed.

- A component flaw might trace to a vendor several stages removed from the utility and vulnerabilities are often the product of several vendors' missteps.
- Adversarial efforts impact multiple systems and subsystems; hardware and software and firmware, classical attack vectors and subtleties difficult for even professional forensic experts. These challenges are beyond utilities' ability to assess.
- The "prior contract" exclusion leaves open vulnerabilities introduced post "contracting." Note that the February 2017 Defense Science Board Report on Cyber Deterrence calls for improvements in defensive capabilities as a key element of deterrence. The "prior contract" exception will assure access by foreign adversaries that will enable continuing implantation of malware, continuing exercise of equipment within the U.S. electric grid and within other critical infrastructures upon which the North American electgric grid depends. . These"prior contract" exceptions are inexcusable; a program needs to be developed -- not by individual registered entities -- to assist in the removal and replacement of hazardous hardware, firmware, and software.
- The absence of hard requirements for "secure vendor accesses", "Internet avoidance", "encryption", "blacklisting known malware", etc. reveals industry ambivalence re: enforceable supply chain controls.
- No plan can possibly be developed that will adequately cover the variety of situations and conditions that exist. They are far too complex to be "planned for" separately by over 1400 independent "Responsible Entities". And we observe the usual escape clause, ***"Obtaining specific controls in the negotiated contract may not be feasible and it is not considered failure to implement an entity's plan".*** How does one define ***success***, under these circumstances?

b. **Requirement R2**. The R2 process is clearly a bureaucratic device; an artificial deadline for updating the plan, get approval from the senior CIP manager (who should have sustained involvement, not at 15 month intervals.) If this process is adopted and approved, the net result will be to undermine the goal of cyber deterrence as enunciated in the February 2017 Defense Science Board Report. Intervals of 15 months between assessments and corrections will enable large gaps that foreign adversaries will exploit.

c. **Requirement R3.** Implementing one or more documented processes for verifying the integrity and authenticity (medium and high impact BES systems) for software and firmware would require substantial forensic competency by the utility. Further, in the reality of the sophisticated attacks that have given rise to Order No. 829, there is very little likelihood of success by over

1400 independent "responsible entities" and the potential for unreasonable expenses in the process. Or did the SDT intend to minimize the task? This illusory requirement illustrates the need for broader initiatives, both within the electric utility industry and outside the industry.

d. **Requirement R4.** The requirement for controlling vendor remote access seriously ignores many gaps and related problems In CIP v5/v6, in the categorization structure and in the process proposed. It fails to lay down hard controls on vendor access and yet requires a complex "documented" process which can easily pass table top compliance review without correcting the many holes in systems as they operate that will remain available to adversaries. Exceptions to CIP standards leave thousands of cyber assets directly interfacing with the internet, not covered by this standard as well as all others. Yet those assets are directly linked to OT and IT systems providing paths for malware, data corruption and opportunities for adversarial control, through supply chain vulnerabilities. With respect to Supply Chain vulnerabilities, Grid connectivity makes nonsense of the categorization of Cyber Assets as "low", "medium" and "high" impact.

e. The practice of rating a low impact asset as "no effect on the BES overall" has consistently ignored the sum of such assets effect on the vulnerabilities of the Grid to uncontrled separation and cascading outages, and permanent damage to long-replacement-time grid equipment.

f. **Requirement R5**. Given the holes described in **R4**, this requirement for verifying product integrity and controlling vendor accesses, and presumably unmonitored machine-to-machine accesses for the few low impact cyber assets covered by CIP standards, is intended to obscure the realities of major portals available to the nation's adversaries. FERC knows CIP standards utterly fail to address the vulnerabilities of so-called low level , so-called "Low Impact" cyber assets, as have been demonstrated to enable takedown of elements of the Ukrainian electric distribution system in both December 2015 and December 2016 . FERC knows that such assets represent major avenues for attack on the BES and the short path to "Distribution" systems and nuclear sites. Notwithstanding, the current supply chain standard needs a major overhaul to provide effective and verifiable system security.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	October 19, 2016
SAR posted for comment	October 20 - November 21, 2016

Anticipated Actions	Date
45-day formal comment period with ballot	May 2017
NERC Board (Board) adoption	August 2017

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None

Upon Board adoption, the rationale boxes will be moved to the Supplemental Material Section.

A. Introduction

1. **Title:** Cyber Security — Electronic Security Perimeter(s)

2. **Number:** CIP-005-6

3. **Purpose:** To manage electronic access to BES Cyber Systems by specifying a controlled Electronic Security Perimeter in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly. For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-010-3:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Date:

See Implementation Plan for Project 2016-03.

6. Background: Standard CIP-005 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-005-6 Table R1 – Electronic Security Perimeter*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-005-6 Table R1 – Electronic Security Perimeter* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-6 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP.	An example of evidence may include, but is not limited to, a list of all ESPs with all uniquely identifiable applicable Cyber Assets connected via a routable protocol within each ESP.
1.2	High Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	All External Routable Connectivity must be through an identified Electronic Access Point (EAP).	An example of evidence may include, but is not limited to, network diagrams showing all external routable communication paths and the identified EAPs.

CIP-005-6 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	Electronic Access Points for High Impact BES Cyber Systems Electronic Access Points for Medium Impact BES Cyber Systems	Require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default.	An example of evidence may include, but is not limited to, a list of rules (firewall, access control lists, etc.) that demonstrate that only permitted access is allowed and that each access rule has a documented reason.
1.4	High Impact BES Cyber Systems with Dial-up Connectivity and their associated: • PCA Medium Impact BES Cyber Systems with Dial-up Connectivity and their associated: • PCA	Where technically feasible, perform authentication when establishing Dial-up Connectivity with applicable Cyber Assets.	An example of evidence may include, but is not limited to, a documented process that describes how the Responsible Entity is providing authenticated access through each dial-up connection.

CIP-005-6 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	Electronic Access Points for High Impact BES Cyber Systems Electronic Access Points for Medium Impact BES Cyber Systems at Control Centers	Have one or more methods for detecting known or suspected malicious communications for both inbound and outbound communications.	An example of evidence may include, but is not limited to, documentation that malicious communications detection methods (e.g. intrusion detection system, application layer firewall, etc.) are implemented.

Rationale for Requirement R2:
Proposed Requirement R2 Parts 2.4 and 2.5 addresses Order No. 829 directives for controls on vendor-initiated remote access to BES Cyber Systems covering both user-initiated and machine-to-machine vendor remote access (P. 51). The objective is to mitigate potential risks of a compromise at a vendor during an active remote access session with a Responsible Entity from impacting the BES.

The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. The obligation in Part 2.4 requires entities to have a method to determine active vendor remote access sessions. While not required, a solution that identifies all active remote access sessions, regardless of whether they originate from a vendor, would meet the intent of this requirement as the objective of Part 2.4. The objective of Requirement R2 Part 2.5 is for entities to have the ability to rapidly disable active remote access sessions in the event of a system breach as specified in Order No. 829 (P. 52).

The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contracts with to supply BES Cyber Systems and related services. It does not include other NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

R2. Each Responsible Entity shall implement one or more documented processes that collectively include the applicable requirement parts, where technically feasible, in *CIP-005-6 Table R2 –Remote Access Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M2. Evidence must include the documented processes that collectively address each of the applicable requirement parts in *CIP-005-6 Table R2 –Remote Access Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-6 Table R2 –Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	For all Interactive Remote Access, utilize an Intermediate System such that the Cyber Asset initiating Interactive Remote Access does not directly access an applicable Cyber Asset.	Examples of evidence may include, but are not limited to, network diagrams or architecture documents.
2.2	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	For all Interactive Remote Access sessions, utilize encryption that terminates at an Intermediate System.	An example of evidence may include, but is not limited to, architecture documents detailing where encryption initiates and terminates.

CIP-005-6 Table R2 –Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	Require multi-factor authentication for all Interactive Remote Access sessions.	An example of evidence may include, but is not limited to, architecture documents detailing the authentication factors used. Examples of authenticators may include, but are not limited to, • Something the individual knows such as passwords or PINs. This does not include User ID; • Something the individual has such as tokens, digital certificates, or smart cards; or • Something the individual is such as fingerprints, iris scans, or other biometric characteristics.

CIP-005-6 Table R2 –Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	Have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods used to determine active vendor remote access (including Interactive Remote Access and system-to-system remote access): • Methods for accessing logged or monitoring information to determine active vendor remote access sessions; • Methods for monitoring activity (e.g. connection tables or rule hit counters in a firewall, or user activity monitoring) or open ports (e.g. netstat or related commands to display currently active ports) to determine active system to system remote access sessions; or • Methods that control vendor initiation of remote access such as vendors calling and requesting a second factor in order to initiate remote access.

CIP-005-6 Table R2 –Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.5	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	Have one or more method(s) to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods(s) used to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access), such as: • Methods to disable vendor remote access at the applicable Electronic Access Point for system-to-system remote access; or • Methods to disable vendor Interactive Remote Access at the applicable Intermediate System.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.			The Responsible Entity did not have a method for detecting malicious communications for both inbound and outbound communications. (1.5)	The Responsible Entity did not document one or more processes for *CIP-005-6 Table R1 – Electronic Security Perimeter*. (R1) OR The Responsible Entity did not have all applicable Cyber Assets connected to a network via a routable protocol within a defined Electronic Security Perimeter (ESP). (1.1) OR External Routable Connectivity through the ESP was not through an identified EAP. (1.2) OR The Responsible Entity did not require inbound and outbound access permissions and deny all other access by default. (1.3)

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				OR The Responsible Entity did not perform authentication when establishing dial-up connectivity with the applicable Cyber Assets, where technically feasible. (1.4)
R2.	The Responsible Entity does not have documented processes for one or more of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for one of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for two of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for three of the applicable items for Requirement Parts 2.1 through 2.3; OR The Responsible Entity did not have one or more method(s) for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) (2.4) and one or more methods to disable active vendor remote access (including Interactive

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	Update
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-005-5.	
6	tbd	Modified to address certain directives in FERC Order No. 829.	Revised

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. Furthermore,

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

CIP-005-6, Requirement R1 requires segmenting of BES Cyber Systems from other systems of differing trust levels by requiring controlled Electronic Access Points between the different trust zones. Electronic Security Perimeters are also used as a primary defense layer for some BES Cyber Systems that may not inherently have sufficient cyber security functionality, such as devices that lack authentication capability.

All applicable BES Cyber Systems that are connected to a network via a routable protocol must have a defined Electronic Security Perimeter (ESP). Even standalone networks that have no external connectivity to other networks must have a defined ESP. The ESP defines a zone of protection around the BES Cyber System, and it also provides clarity for entities to determine what systems or Cyber Assets are in scope and what requirements they must meet. The ESP is used in:

- Defining the scope of 'Associated Protected Cyber Assets' that must also meet certain CIP requirements.
- Defining the boundary in which all of the Cyber Assets must meet the requirements of the highest impact BES Cyber System that is in the zone (the 'high water mark').

The CIP Cyber Security Standards do not require network segmentation of BES Cyber Systems by impact classification. Many different impact classifications can be mixed within an ESP.

However, all of the Cyber Assets and BES Cyber Systems within the ESP must be protected at the level of the highest impact BES Cyber System present in the ESP (i.e., the "high water mark") where the term "Protected Cyber Assets" is used. The CIP Cyber Security Standards accomplish the "high water mark" by associating all other Cyber Assets within the ESP, even other BES Cyber Systems of lesser impact, as "Protected Cyber Assets" of the highest impact system in the ESP.

For example, if an ESP contains both a high impact BES Cyber System and a low impact BES Cyber System, each Cyber Asset of the low impact BES Cyber System is an "Associated Protected Cyber Asset" of the high impact BES Cyber System and must meet all requirements with that designation in the applicability columns of the requirement tables.

If there is routable connectivity across the ESP into any Cyber Asset, then an Electronic Access Point (EAP) must control traffic into and out of the ESP. Responsible Entities should know what traffic needs to cross an EAP and document those reasons to ensure the EAPs limit the traffic to only those known communication needs. These include, but are not limited to, communications needed for normal operations, emergency operations, support, maintenance, and troubleshooting.

The EAP should control both inbound and outbound traffic. The standard added outbound traffic control, as it is a prime indicator of compromise and a first level of defense against zero day vulnerability-based attacks. If Cyber Assets within the ESP become compromised and attempt to communicate to unknown hosts outside the ESP (usually 'command and control' hosts on the Internet, or compromised 'jump hosts' within the Responsible Entity's other networks acting as intermediaries), the EAPs should function as a first level of defense in stopping the exploit. This does not limit the Responsible Entity from controlling outbound traffic at the level of granularity that it deems appropriate, and large ranges of internal addresses may be allowed. The SDT's intent is that the Responsible Entity knows what other Cyber Assets or ranges of addresses a BES Cyber System needs to communicate with and limits the communications to that known range. For example, most BES Cyber Systems within a Responsible Entity should not have the ability to communicate through an EAP to any network address in the world, but should probably be at least limited to the address space of the Responsible Entity, and preferably to individual subnet ranges or individual hosts within the Responsible Entity's address space. The SDT's intent is not for Responsible Entities to document the inner workings of stateful firewalls, where connections initiated in one direction are allowed a return path. The intent is to know and document what systems can talk to what other systems or ranges of systems on the other side of the EAP, such that rogue connections can be detected and blocked.

This requirement applies only to communications for which access lists and 'deny by default' type requirements can be universally applied, which today are those that employ routable protocols. Direct serial, non-routable connections are not included as there is no perimeter or firewall type security that should be universally mandated across all entities and all serial communication situations. There is no firewall or perimeter capability for an RS232 cable run

between two Cyber Assets. Without a clear 'perimeter type' security control that can be applied in practically every circumstance, such a requirement would mostly generate technical feasibility exceptions ("TFEs") rather than increased security.

As for dial-up connectivity, the Standard Drafting Team's intent of this requirement is to prevent situations where only a phone number can establish direct connectivity to the BES Cyber Asset. If a dial-up modem is implemented in such a way that it simply answers the phone and connects the line to the BES Cyber Asset with no authentication of the calling party, it is a vulnerability to the BES Cyber System. The requirement calls for some form of authentication of the calling party before completing the connection to the BES Cyber System. Some examples of acceptable methods include dial-back modems, modems that must be remotely enabled or powered up, and modems that are only powered on by onsite personnel when needed along with policy that states they are disabled after use. If the dial-up connectivity is used for Interactive Remote Access, then Requirement R2 also applies.

The standard adds a requirement to detect malicious communications for Control Centers. This is in response to FERC Order No. 706, Paragraphs 496-503, where ESPs are required to have two distinct security measures such that the BES Cyber Systems do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear that this is not simply redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs. Technologies meeting this requirement include Intrusion Detection or Intrusion Prevention Systems (IDS/IPS) or other forms of deep packet inspection. These technologies go beyond source/destination/port rule sets and thus provide another distinct security measure at the ESP.

Requirement R2:

See Secure Remote Access Reference Document (see remote access alert).

Rationale

During the development of this standard, references to prior versions of the CIP standards and rationale for the requirements and their parts were embedded within the standard. Upon BOT approval, that information was moved to this section.

Rationale for R1:
The Electronic Security Perimeter ("ESP") serves to control traffic at the external electronic boundary of the BES Cyber System. It provides a first layer of defense for network based attacks as it limits reconnaissance of targets, restricts and prohibits traffic to a specified rule set, and assists in containing any successful attacks.

Summary of Changes: CIP-005, Requirement R1 has taken more of a focus on the discrete Electronic Access Points, rather than the logical "perimeter."

CIP-005 (V1 through V4), Requirement R1.2 has been deleted from V5. This requirement was definitional in nature and used to bring dial-up modems using non-routable protocols into the scope of CIP-005. The non-routable protocol exclusion no longer exists as a blanket CIP-002 filter for applicability in V5, therefore there is no need for this requirement.

CIP-005 (V1 through V4), Requirement R1.1 and R1.3 were also definitional in nature and have been deleted from V5 as separate requirements but the concepts were integrated into the definitions of ESP and Electronic Access Point ("EAP").

Reference to prior version: (Part 1.1) CIP-005-4, R1

Change Rationale: (Part 1.1)
Explicitly clarifies that BES Cyber Assets connected via routable protocol must be in an Electronic Security Perimeter.

Reference to prior version: (Part 1.2) CIP-005-4, R1

Change Rationale: (Part 1.2)
Changed to refer to the defined term Electronic Access Point and BES Cyber System.

Reference to prior version: (Part 1.3) CIP-005-4, R2.1

Change Rationale: (Part 1.3)
Changed to refer to the defined term Electronic Access Point and to focus on the entity knowing and having a reason for what it allows through the EAP in both inbound and outbound directions.

Reference to prior version: (Part 1.4) CIP-005-4, R2.3

Change Rationale: (Part 1.4)
Added clarification that dial-up connectivity should perform authentication so that the BES Cyber System is not directly accessible with a phone number only.

Reference to prior version: (Part 1.5) CIP-005-4, R1

Change Rationale: (Part 1.5)
Per FERC Order No. 706, Paragraphs 496-503, ESPs need two distinct security measures such that the Cyber Assets do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear this is not simple redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs.

Rationale for R2:
Registered Entities use Interactive Remote Access to access Cyber Assets to support and maintain control systems networks. Discovery and announcement of vulnerabilities for remote access methods and technologies, that were previously thought secure and in use by a number of electric sector entities, necessitate changes to industry security control standards. Currently, no requirements are in effect for management of secure remote access to Cyber Assets to be afforded the NERC CIP protective measures. Inadequate safeguards for remote access can allow unauthorized access to the organization's network, with potentially serious consequences. Additional information is provided in ***Guidance for Secure Interactive Remote Access*** published by NERC in July 2011.

Remote access control procedures must provide adequate safeguards through robust identification, authentication and encryption techniques. Remote access to the organization's network and resources will only be permitted providing that authorized users are authenticated, data is encrypted across the network, and privileges are restricted.

The Intermediate System serves as a proxy for the remote user. Rather than allowing all the protocols the user might need to access Cyber Assets inside the Electronic Security Perimeter to traverse from the Electronic Security Perimeter to the remote computer, only the protocol required for remotely controlling the jump host is required. This allows the firewall rules to be much more restrictive than if the remote computer was allowed to connect to Cyber Assets within the Electronic Security Perimeter directly. The use of an Intermediate System also protects the Cyber Asset from vulnerabilities on the remote computer.

The use of multi-factor authentication provides an added layer of security. Passwords can be guessed, stolen, hijacked, found, or given away. They are subject to automated attacks including brute force attacks, in which possible passwords are tried until the password is found, or dictionary attacks, where words and word combinations are tested as possible passwords. But if a password or PIN must be supplied along with a one-time password supplied by a token, a fingerprint, or some other factor, the password is of no value unless the other factor(s) used for authentication are acquired along with it.

Encryption is used to protect the data that is sent between the remote computer and the Intermediate System. Data encryption is important for anyone who wants or needs secure data transfer. Encryption is needed when there is a risk of unauthorized interception of transmissions on the communications link. This is especially important when using the Internet as the communication means.

Summary of Changes: This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.1) New

Change Rationale: (Part 2.1)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.2) CIP-007-5, R3.1

Change Rationale: (Part 2.2)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The purpose of this part is to protect the confidentiality and integrity of each Interactive Remote Access session.

Reference to prior version: (Part 2.3) CIP-007-5, R3.2

Change Rationale: (Part 2.3)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The multi-factor authentication methods are also the same as those identified in the Homeland Security Presidential Directive 12 (HSPD-12), issued August 12, 2007.

A. Introduction

1. **Title:** Cyber Security — Electronic Security Perimeter(s)

2. **Number:** CIP-005-~~5~~6

3. **Purpose:** To manage electronic access to BES Cyber Systems by specifying a controlled Electronic Security Perimeter in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each ~~Special Protection System or~~ Remedial Action Scheme where the ~~Special Protection System or~~ Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each ~~Special Protection System or~~ Remedial Action Scheme where the ~~Special Protection System or~~ Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-005-~~5~~6:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes.

5. Effective Dates: See Implementation Plan for Project 2016-03

6. Background: Standard CIP-005-~~5~~ exists as part of a suite of CIP Standards related to cyber security which require the initial identification and categorization of BES Cyber Systems and require organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.~~ CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1 require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards.*~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, ~~etc~~etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables: Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5 identification and categorization processes.
- **High Impact BES Cyber Systems with Dial-up Connectivity** – Only applies to high impact BES Cyber Systems with Dial-up Connectivity.

- **High Impact BES Cyber Systems with External Routable Connectivity** – Only applies to high impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Medium Impact BES Cyber Systems** – Applies to each BES Cyber Systems categorized as medium impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.
- **Medium Impact BES Cyber Systems with Dial-up Connectivity** – Only applies to medium impact BES Cyber Systems with Dial-up Connectivity.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Electronic Access Points (EAP)** – Applies at Electronic Access Points associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-005-~~5~~ 6 Table R1 – Electronic Security Perimeter*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-005-~~5~~ 6 Table R1 – Electronic Security Perimeter* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-~~5~~ 6 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP.	An example of evidence may include, but is not limited to, a list of all ESPs with all uniquely identifiable applicable Cyber Assets connected via a routable protocol within each ESP.
1.2	High Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	All External Routable Connectivity must be through an identified Electronic Access Point (EAP).	An example of evidence may include, but is not limited to, network diagrams showing all external routable communication paths and the identified EAPs.

CIP-005-~~5~~ 6 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	Electronic Access Points for High Impact BES Cyber Systems Electronic Access Points for Medium Impact BES Cyber Systems	Require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default.	An example of evidence may include, but is not limited to, a list of rules (firewall, access control lists, etc.) that demonstrate that only permitted access is allowed and that each access rule has a documented reason.
1.4	High Impact BES Cyber Systems with Dial-up Connectivity and their associated: • PCA Medium Impact BES Cyber Systems with Dial-up Connectivity and their associated: • PCA	Where technically feasible, perform authentication when establishing Dial-up Connectivity with applicable Cyber Assets.	An example of evidence may include, but is not limited to, a documented process that describes how the Responsible Entity is providing authenticated access through each dial-up connection.

CIP-005-~~5~~ 6 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	Electronic Access Points for High Impact BES Cyber Systems Electronic Access Points for Medium Impact BES Cyber Systems at Control Centers	Have one or more methods for detecting known or suspected malicious communications for both inbound and outbound communications.	An example of evidence may include, but is not limited to, documentation that malicious communications detection methods (e.g. intrusion detection system, application layer firewall, etc.) are implemented.

Rationale for Requirement R2:
Proposed Requirement R2 Parts 2.4 and 2.5 addresses Order No. 829 directives for controls on vendor-initiated remote access to BES Cyber Systems covering both user-initiated and machine-to-machine vendor remote access (P. 51). The objective is to mitigate potential risks of a compromise at a vendor during an active remote access session with a Responsible Entity from impacting the BES.

The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. The obligation in Part 2.4 requires entities to have a method to determine active vendor remote access sessions. While not required, a solution that identifies all active remote access sessions, regardless of whether they originate from a vendor, would meet the intent of this requirement as the objective of Part 2.4. The objective of Requirement R2 Part 2.5 is for entities to have the ability to rapidly disable active remote access sessions in the event of a system breach as specified in Order No. 829 (P. 52).

The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contracts with to supply BES Cyber Systems and related services. It does not include other NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

R2. Each Responsible Entity ~~allowing Interactive Remote Access to BES Cyber Systems~~ shall implement one or more documented processes that collectively include the applicable requirement parts, where technically feasible, in *CIP-005-~~5~~ 6 Table R2 – ~~Interactive~~ Remote Access Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M2. Evidence must include the documented processes that collectively address each of the applicable requirement parts in *CIP-005-~~5~~ 6 Table R2 – ~~Interactive~~ Remote Access Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-~~5~~ 6 Table R2 – ~~Interactive~~ Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	For all Interactive Remote Access, ~~U~~utilize an Intermediate System such that the Cyber Asset initiating Interactive Remote Access does not directly access an applicable Cyber Asset.	Examples of evidence may include, but are not limited to, network diagrams or architecture documents.
2.2	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	For all Interactive Remote Access sessions, utilize encryption that terminates at an Intermediate System.	An example of evidence may include, but is not limited to, architecture documents detailing where encryption initiates and terminates.

CIP-005-~~5~~ 6 Table R2 – ~~Interactive~~ Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	Require multi-factor authentication for all Interactive Remote Access sessions.	An example of evidence may include, but is not limited to, architecture documents detailing the authentication factors used. Examples of authenticators may include, but are not limited to, • Something the individual knows such as passwords or PINs. This does not include User ID; • Something the individual has such as tokens, digital certificates, or smart cards; or • Something the individual is such as fingerprints, iris scans, or other biometric characteristics.

CIP-005-~~5~~ 6 Table R2 – ~~Interactive~~ Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	• Have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods used to determine active vendor remote access (including Interactive Remote Access and system-to-system remote access): • Methods for accessing logged or monitoring information to determine active vendor remote access sessions; • Methods for monitoring activity (e.g. connection tables or rule hit counters in a firewall, or user activity monitoring) or open ports (e.g. netstat or related commands to display currently active ports) to determine active system to system remote access sessions; or • Methods that control vendor initiation of remote access such as vendors calling and requesting a second factor in order to initiate remote access. •

CIP-005-~~5~~ 6 Table R2 – ~~Interactive~~ Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.5	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	Have one or more method(s) to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods(s) used to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access), such as: • Methods to disable vendor remote access at the applicable Electronic Access Point for system-to-system remote access; or • Methods to disable vendor Interactive Remote Access at the applicable Intermediate System.

C. Compliance

1. **Compliance Monitoring Process:**

   1.1. Compliance Enforcement Authority: The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

   1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit

   The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

   - Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
   - If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
   - The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

   1.3. Compliance Monitoring and Assessment Processes:

   - Compliance Audit
   - Self-Certification
   - Spot Checking
   - Compliance Investigation
   - Self-Reporting
   - Complaint

   1.4. Additional Compliance Information:

   None.

Violation Severity Levels

R #	Time Horizon	VRF	Violation Severity Levels (CIP-005-~~5~~ 6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	**Operations Planning and Same Day Operations**	**Medium**			The Responsible Entity did not have a method for detecting malicious communications for both inbound and outbound communications. (1.5)	The Responsible Entity did not document one or more processes for *CIP-005-~~5~~ 6 Table R1 – Electronic Security Perimeter*. (R1) OR The Responsible Entity did not have all applicable Cyber Assets connected to a network via a routable protocol within a defined Electronic Security Perimeter (ESP). (1.1) OR External Routable Connectivity through the ESP was not through an identified EAP. (1.2) OR

R #	Time Horizon	VRF	Violation Severity Levels (CIP-005-~~5~~ 6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						The Responsible Entity did not require inbound and outbound access permissions and deny all other access by default. (1.3) OR The Responsible Entity did not perform authentication when establishing dial-up connectivity with the applicable Cyber Assets, where technically feasible. (1.4)
R2.	**Operations Planning and Same Day Operations**	**Medium**	The Responsible Entity does not have documented processes for one or more of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for one of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for two of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for three of the applicable items for Requirement Parts 2.1 through 2.3; ~~.~~ OR

R #	Time Horizon	VRF	Violation Severity Levels (CIP-005-~~5~~ 6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						The Responsible Entity did not have one or more method(s) for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) (2.4) and one or more methods to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access) (2.5).

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	Update
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-005-5.	

6	tbd	Modified to address certain directives in FERC Order No. 829.	Revised

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. Furthermore,

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

CIP-005-5-6, Requirement R1 requires segmenting of BES Cyber Systems from other systems of differing trust levels by requiring controlled Electronic Access Points between the different trust zones. Electronic Security Perimeters are also used as a primary defense layer for some BES Cyber Systems that may not inherently have sufficient cyber security functionality, such as devices that lack authentication capability.

All applicable BES Cyber Systems that are connected to a network via a routable protocol must have a defined Electronic Security Perimeter (ESP). Even standalone networks that have no external connectivity to other networks must have a defined ESP. The ESP defines a zone of protection around the BES Cyber System, and it also provides clarity for entities to determine what systems or Cyber Assets are in scope and what requirements they must meet. The ESP is used in:

- Defining the scope of 'Associated Protected Cyber Assets' that must also meet certain CIP requirements.
- Defining the boundary in which all of the Cyber Assets must meet the requirements of the highest impact BES Cyber System that is in the zone (the 'high water mark').

The CIP Cyber Security Standards do not require network segmentation of BES Cyber Systems by impact classification. Many different impact classifications can be mixed within an ESP.

However, all of the Cyber Assets and BES Cyber Systems within the ESP must be protected at the level of the highest impact BES Cyber System present in the ESP (i.e., the "high water mark") where the term "Protected Cyber Assets" is used. The CIP Cyber Security Standards accomplish the "high water mark" by associating all other Cyber Assets within the ESP, even other BES Cyber Systems of lesser impact, as "Protected Cyber Assets" of the highest impact system in the ESP.

For example, if an ESP contains both a high impact BES Cyber System and a low impact BES Cyber System, each Cyber Asset of the low impact BES Cyber System is an "Associated Protected Cyber Asset" of the high impact BES Cyber System and must meet all requirements with that designation in the applicability columns of the requirement tables.

If there is routable connectivity across the ESP into any Cyber Asset, then an Electronic Access Point (EAP) must control traffic into and out of the ESP. Responsible Entities should know what traffic needs to cross an EAP and document those reasons to ensure the EAPs limit the traffic to only those known communication needs. These include, but are not limited to, communications needed for normal operations, emergency operations, support, maintenance, and troubleshooting.

The EAP should control both inbound and outbound traffic. The standard added outbound traffic control, as it is a prime indicator of compromise and a first level of defense against zero day vulnerability-based attacks. If Cyber Assets within the ESP become compromised and attempt to communicate to unknown hosts outside the ESP (usually 'command and control' hosts on the Internet, or compromised 'jump hosts' within the Responsible Entity's other networks acting as intermediaries), the EAPs should function as a first level of defense in stopping the exploit. This does not limit the Responsible Entity from controlling outbound traffic at the level of granularity that it deems appropriate, and large ranges of internal addresses may be allowed. The SDT's intent is that the Responsible Entity knows what other Cyber Assets or ranges of addresses a BES Cyber System needs to communicate with and limits the communications to that known range. For example, most BES Cyber Systems within a Responsible Entity should not have the ability to communicate through an EAP to any network address in the world, but should probably be at least limited to the address space of the Responsible Entity, and preferably to individual subnet ranges or individual hosts within the Responsible Entity's address space. The SDT's intent is not for Responsible Entities to document the inner workings of stateful firewalls, where connections initiated in one direction are allowed a return path. The intent is to know and document what systems can talk to what other systems or ranges of systems on the other side of the EAP, such that rogue connections can be detected and blocked.

This requirement applies only to communications for which access lists and 'deny by default' type requirements can be universally applied, which today are those that employ routable protocols. Direct serial, non-routable connections are not included as there is no perimeter or firewall type security that should be universally mandated across all entities and all serial communication situations. There is no firewall or perimeter capability for an RS232 cable run

between two Cyber Assets. Without a clear 'perimeter type' security control that can be applied in practically every circumstance, such a requirement would mostly generate technical feasibility exceptions ("TFEs") rather than increased security.

As for dial-up connectivity, the Standard Drafting Team's intent of this requirement is to prevent situations where only a phone number can establish direct connectivity to the BES Cyber Asset. If a dial-up modem is implemented in such a way that it simply answers the phone and connects the line to the BES Cyber Asset with no authentication of the calling party, it is a vulnerability to the BES Cyber System. The requirement calls for some form of authentication of the calling party before completing the connection to the BES Cyber System. Some examples of acceptable methods include dial-back modems, modems that must be remotely enabled or powered up, and modems that are only powered on by onsite personnel when needed along with policy that states they are disabled after use. If the dial-up connectivity is used for Interactive Remote Access, then Requirement R2 also applies.

The standard adds a requirement to detect malicious communications for Control Centers. This is in response to FERC Order No. 706, Paragraphs 496-503, where ESPs are required to have two distinct security measures such that the BES Cyber Systems do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear that this is not simply redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs. Technologies meeting this requirement include Intrusion Detection or Intrusion Prevention Systems (IDS/IPS) or other forms of deep packet inspection. These technologies go beyond source/destination/port rule sets and thus provide another distinct security measure at the ESP.

Requirement R2:

See Secure Remote Access Reference Document (see remote access alert).

Rationale

During the development of this standard, references to prior versions of the CIP standards and rationale for the requirements and their parts were embedded within the standard. Upon BOT approval, that information was moved to this section.

Rationale for R1:
The Electronic Security Perimeter ("ESP") serves to control traffic at the external electronic boundary of the BES Cyber System. It provides a first layer of defense for network based attacks as it limits reconnaissance of targets, restricts and prohibits traffic to a specified rule set, and assists in containing any successful attacks.

Summary of Changes: CIP-005, Requirement R1 has taken more of a focus on the discrete Electronic Access Points, rather than the logical "perimeter."

CIP-005 (V1 through V4), Requirement R1.2 has been deleted from V5. This requirement was definitional in nature and used to bring dial-up modems using non-routable protocols into the scope of CIP-005. The non-routable protocol exclusion no longer exists as a blanket CIP-002 filter for applicability in V5, therefore there is no need for this requirement.

CIP-005 (V1 through V4), Requirement R1.1 and R1.3 were also definitional in nature and have been deleted from V5 as separate requirements but the concepts were integrated into the definitions of ESP and Electronic Access Point ("EAP").

Reference to prior version: (Part 1.1) CIP-005-4, R1

Change Rationale: (Part 1.1)
Explicitly clarifies that BES Cyber Assets connected via routable protocol must be in an Electronic Security Perimeter.

Reference to prior version: (Part 1.2) CIP-005-4, R1

Change Rationale: (Part 1.2)
Changed to refer to the defined term Electronic Access Point and BES Cyber System.

Reference to prior version: (Part 1.3) CIP-005-4, R2.1

Change Rationale: (Part 1.3)
Changed to refer to the defined term Electronic Access Point and to focus on the entity knowing and having a reason for what it allows through the EAP in both inbound and outbound directions.

Reference to prior version: (Part 1.4) CIP-005-4, R2.3

Change Rationale: (Part 1.4)
Added clarification that dial-up connectivity should perform authentication so that the BES Cyber System is not directly accessible with a phone number only.

Reference to prior version: (Part 1.5) CIP-005-4, R1

Change Rationale: (Part 1.5)
Per FERC Order No. 706, Paragraphs 496-503, ESPs need two distinct security measures such that the Cyber Assets do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear this is not simple redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs.

Rationale for R2:
Registered Entities use Interactive Remote Access to access Cyber Assets to support and maintain control systems networks. Discovery and announcement of vulnerabilities for remote access methods and technologies, that were previously thought secure and in use by a number of electric sector entities, necessitate changes to industry security control standards. Currently, no requirements are in effect for management of secure remote access to Cyber Assets to be afforded the NERC CIP protective measures. Inadequate safeguards for remote access can allow unauthorized access to the organization's network, with potentially serious consequences. Additional information is provided in ***Guidance for Secure Interactive Remote Access*** published by NERC in July 2011.

Remote access control procedures must provide adequate safeguards through robust identification, authentication and encryption techniques. Remote access to the organization's network and resources will only be permitted providing that authorized users are authenticated, data is encrypted across the network, and privileges are restricted.

The Intermediate System serves as a proxy for the remote user. Rather than allowing all the protocols the user might need to access Cyber Assets inside the Electronic Security Perimeter to traverse from the Electronic Security Perimeter to the remote computer, only the protocol required for remotely controlling the jump host is required. This allows the firewall rules to be much more restrictive than if the remote computer was allowed to connect to Cyber Assets within the Electronic Security Perimeter directly. The use of an Intermediate System also protects the Cyber Asset from vulnerabilities on the remote computer.

The use of multi-factor authentication provides an added layer of security. Passwords can be guessed, stolen, hijacked, found, or given away. They are subject to automated attacks including brute force attacks, in which possible passwords are tried until the password is found, or dictionary attacks, where words and word combinations are tested as possible passwords. But if a password or PIN must be supplied along with a one-time password supplied by a token, a fingerprint, or some other factor, the password is of no value unless the other factor(s) used for authentication are acquired along with it.

Encryption is used to protect the data that is sent between the remote computer and the Intermediate System. Data encryption is important for anyone who wants or needs secure data transfer. Encryption is needed when there is a risk of unauthorized interception of transmissions on the communications link. This is especially important when using the Internet as the communication means.

Summary of Changes: This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.1) New

Change Rationale: (Part 2.1)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.2) CIP-007-5, R3.1

Change Rationale: (Part 2.2)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The purpose of this part is to protect the confidentiality and integrity of each Interactive Remote Access session.

Reference to prior version: (Part 2.3) CIP-007-5, R3.2

Change Rationale: (Part 2.3)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The multi-factor authentication methods are also the same as those identified in the Homeland Security Presidential Directive 12 (HSPD-12), issued August 12, 2007.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	October 19, 2016
SAR posted for comment	October 20 - November 21, 2016

Anticipated Actions	Date
45-day formal comment period with ballot	May 2017
NERC Board (Board) adoption	August 2017

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None

Upon Board adoption, the rationale boxes will be moved to the Supplemental Material Section.

A. Introduction

1. **Title:** Cyber Security — Configuration Change Management and Vulnerability Assessments

2. **Number:** CIP-010-3

3. **Purpose:** To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly. For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one

or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and

including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-010-3:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Date:

See Implementation Plan for Project 2016-03.

6. Background: Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training

program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples

may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:
Proposed requirement R1 Part 1.6 addresses directives in Order No. 829 for verifying software integrity and authenticity prior to installation in BES Cyber Systems (P. 48).

The objective of verifying software integrity and authenticity is to ensure that the software being installed in the BES Cyber System was not modified without the awareness of the software supplier and is not counterfeit.

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-3 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-3 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.6	High Impact BES Cyber Systems Medium Impact BES Cyber Systems Note: Implementation does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Part 1.6: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.	For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5, and when the method to do so is available to the Responsible Entity from the software source: 1.6.1. Verify the identity of the software source; and 1.6.2. Verify the integrity of the software obtained from the software source.	An example of evidence may include, but is not limited to a change request record that demonstrates the verification of identity of the software source and integrity of the software was performed during the baseline change.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-3 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-3 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-3 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-3 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-3 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

R4. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems and associated Protected Cyber Assets, shall implement, except under CIP Exceptional Circumstances, one or more documented plan(s) for Transient Cyber Assets

and Removable Media that include the sections in Attachment 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence shall include each of the documented plan(s) for Transient Cyber Assets and Removable Media that collectively include each of the applicable sections in Attachment 1 and additional evidence to demonstrate implementation of plan(s) for Transient Cyber Assets and Removable Media. Additional examples of evidence per section are located in Attachment 2. If a Responsible Entity does not use Transient Cyber Asset(s) or Removable Media, examples of evidence include, but are not limited to, a statement, policy, or other document that states the Responsible Entity does not use Transient Cyber Asset(s) or Removable Media.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only four of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only three of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only two of the required baseline items listed in 1.1.1 through 1.1.5. (1.1) OR The Responsible Entity has a process to verify the identity of the software source (1.6.1) but does not have a process to verify the integrity of the software provided by the software source when the method to do so is available to the Responsible Entity from the software source (1.6.2)	The Responsible Entity has not documented or implemented any configuration change management process(es). (R1) OR The Responsible Entity has documented and implemented a configuration change management process(es) that includes only one of the required baseline items listed in 1.1.1 through 1.1.5. (1.1) OR The Responsible Entity does not have a process(es) that requires authorization and documentation of changes that deviate from the existing baseline configuration. (1.2)

R #	Violation Severity Levels

Required Sections for Plans for Transient Cyber Assets and Removable Media

Responsible Entities shall include each of the sections provided below in their plan(s) for Transient Cyber Assets and Removable Media as required under Requirement R4.

Section 1. Transient Cyber Asset(s) Managed by the Responsible Entity.

1.1. Transient Cyber Asset Management: Responsible Entities shall manage Transient Cyber Asset(s), individually or by group: (1) in an ongoing manner to ensure compliance with applicable requirements at all times, (2) in an on-demand manner applying the applicable requirements before connection to a BES Cyber System, or (3) a combination of both (1) and (2) above.

1.2. Transient Cyber Asset Authorization: For each individual or group of Transient Cyber Asset(s), each Responsible Entity shall authorize:

1.2.1. Users, either individually or by group or role;

1.2.2. Locations, either individually or by group; and

1.2.3. Uses, which shall be limited to what is necessary to perform business functions.

1.3. Software Vulnerability Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of vulnerabilities posed by unpatched software on the Transient Cyber Asset (per Transient Cyber Asset capability):

- Security patching, including manual or managed updates;
- Live operating system and software executable only from read-only media;
- System hardening; or
- Other method(s) to mitigate software vulnerabilities.

1.4. Introduction of Malicious Code Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the introduction of malicious code (per Transient Cyber Asset capability):

- Antivirus software, including manual or managed updates of signatures or patterns;
- Application whitelisting; or
- Other method(s) to mitigate the introduction of malicious code.

1.5. Unauthorized Use Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of unauthorized use of Transient Cyber Asset(s):

- Restrict physical access;
- Full-disk encryption with authentication;
- Multi-factor authentication; or
- Other method(s) to mitigate the risk of unauthorized use.

Section 2. Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity.

2.1 Software Vulnerabilities Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of vulnerabilities posed by unpatched software on the Transient Cyber Asset (per Transient Cyber Asset capability):

- Review of installed security patch(es);
- Review of security patching process used by the party;
- Review of other vulnerability mitigation performed by the party; or
- Other method(s) to mitigate software vulnerabilities.

2.2 Introduction of malicious code mitigation: Use one or a combination of the following methods to achieve the objective of mitigating malicious code (per Transient Cyber Asset capability):

- Review of antivirus update level;
- Review of antivirus update process used by the party;
- Review of application whitelisting used by the party;
- Review use of live operating system and software executable only from read-only media;
- Review of system hardening used by the party; or
- Other method(s) to mitigate malicious code.

2.3 For any method used to mitigate software vulnerabilities or malicious code as specified in 2.1 and 2.2, Responsible Entities shall determine whether any additional mitigation actions are necessary and implement such actions prior to connecting the Transient Cyber Asset.

Section 3. Removable Media

3.1. Removable Media Authorization: For each individual or group of Removable Media, each Responsible Entity shall authorize:

3.1.1. Users, either individually or by group or role; and

3.1.2. Locations, either individually or by group.

3.2. Malicious Code Mitigation: To achieve the objective of mitigating the threat of introducing malicious code to high impact or medium impact BES Cyber Systems and their associated Protected Cyber Assets, each Responsible Entity shall:

3.2.1. Use method(s) to detect malicious code on Removable Media using a Cyber Asset other than a BES Cyber System or Protected Cyber Assets; and

3.2.2. Mitigate the threat of detected malicious code on Removable Media prior to connecting the Removable Media to a high impact or medium impact BES Cyber System or associated Protected Cyber Assets.

CIP-010-3 - Attachment 2

Examples of Evidence for Plans for Transient Cyber Assets and Removable Media

Section 1.1: Examples of evidence for Section 1.1 may include, but are not limited to, the method(s) of management for the Transient Cyber Asset(s). This can be included as part of the Transient Cyber Asset plan(s), part of the documentation related to authorization of Transient Cyber Asset(s) managed by the Responsible Entity or part of a security policy.

Section 1.2: Examples of evidence for Section 1.2 may include, but are not limited to, documentation from asset management systems, human resource management systems, or forms or spreadsheets that show authorization of Transient Cyber Asset(s) managed by the Responsible Entity. Alternatively, this can be documented in the overarching plan document.

Section 1.3: Examples of evidence for Section 1.3 may include, but are not limited to, documentation of the method(s) used to mitigate software vulnerabilities posed by unpatched software such as security patch management implementation, the use of live operating systems from read-only media, system hardening practices or other method(s) to mitigate the software vulnerability posed by unpatched software. Evidence can be from change management systems, automated patch management solutions, procedures or processes associated with using live operating systems, or procedures or processes associated with system hardening practices. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the vendor or Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 1.4: Examples of evidence for Section 1.4 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 1.5: Examples of evidence for Section 1.5 may include, but are not limited to, documentation through policies or procedures of the method(s) to restrict physical access; method(s) of the full-disk encryption solution along with the authentication protocol; method(s) of the multi-factor authentication solution; or documentation of other method(s) to mitigate the risk of unauthorized use.

Section 2.1: Examples of evidence for Section 2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of installed security patch(es); memoranda, electronic mail, policies or contracts from parties other than the Responsible Entity that identify the security patching process or vulnerability mitigation performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail, system documentation or contracts that identifies acceptance by the Responsible Entity that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate software vulnerabilities for Transient Cyber Asset(s) managed by a party other than the Responsible Entity. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 2.2: Examples of evidence for Section 2.2 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed antivirus update level; memoranda, electronic mail, system documentation, policies or contracts from the party other than the Responsible Entity that identify the antivirus update process, the use of application whitelisting, use of live of operating systems or system hardening performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that identifies the Responsible Entity's acceptance that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate malicious code for Transient Cyber Asset(s) managed by a party other than the Responsible Entity. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 2.3: Examples of evidence for Section 2.3 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigations are necessary and that they have been implemented prior to connecting the Transient Cyber Asset managed by a party other than the Responsible Entity.

Section 3.1: Examples of evidence for Section 3.1 may include, but are not limited to, documentation from asset management systems, human resource management systems, forms or spreadsheets that shows authorization of Removable Media. The documentation must identify Removable Media, individually or by group of Removable Media, along with the authorized users,

either individually or by group or role, and the authorized locations, either individually or by group.

Section 3.2: Examples of evidence for Section 3.2 may include, but are not limited to, documented process(es) of the method(s) used to mitigate malicious code such as results of scan settings for Removable Media, or implementation of on-demand scanning. Documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and that show mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included. Custom software installed may include scripts developed for local entity functions or

other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Software Integrity and Authenticity

The concept of verifying software integrity and authenticity is a key control in preventing the introduction of malware or counterfeit software. This objective is intended to reduce the likelihood that an attacker could exploit legitimate vendor patch management processes to deliver compromised software updates or patches to a BES Cyber System. The intent of the SDT is to provide controls for verifying the baseline elements that are updated by vendors. It is important to note that this is not limited to only security patches. That is why the requirement was not placed in CIP-007 - Security Patch Management.

NIST SP-800-161 includes a number of security controls, which, when taken together, reduce the probability of a successful "Watering Hole" or similar cyber attack in the industrial control system environment and thus could assist in addressing this objective. For example, in the System and Information Integrity (SI) control family, control SI-7 suggests that the integrity of information systems and obtaining software directly from the developer. In the Configuration Management (CM) control family, control CM-5(3) requires that the information system prevent the installation of firmware of software without the verification that the component has been digitally signed to ensure that the hardware and software components are genuine and valid. NIST SP-800-161, while not meant to be definitive, provides examples of controls for addressing this objective. Other controls also could meet this objective.

It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches.

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.
2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.
3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Requirement R4:

Because most BES Cyber Assets and BES Cyber Systems are isolated from external public or untrusted networks, Transient Cyber Assets and Removable Media are a means for cyber-attack. Transient Cyber Assets and Removable Media are often the only way to transport files to and from secure areas to maintain, monitor, or troubleshoot critical systems. To protect the BES Cyber Assets and BES Cyber Systems, entities are required to document and implement a plan for how they will manage the use of Transient Cyber Assets and Removable Media. The approach of defining a plan allows the Responsible Entity to document the processes that are supportable within its organization and in alignment with its change management processes.

Transient Cyber Assets and Removable Media are those devices connected temporarily to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Transient Cyber Assets and Removable Media do not provide BES reliability services and are not part of the BES Cyber Asset to which they are connected. Examples of these temporarily connected devices include, but are not limited to:

- Diagnostic test equipment;
- Packet sniffers;
- Equipment used for BES Cyber System maintenance;
- Equipment used for BES Cyber System configuration; or
- Equipment used to perform vulnerability assessments.

Transient Cyber Assets can be one of many types of devices from a specially-designed device for maintaining equipment in support of the BES to a platform such as a laptop, desktop, or tablet that may just interface with or run applications that support BES Cyber Systems and is capable of transmitting executable code. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

While the definitions of Transient Cyber Asset and Removable Media include a conditional provision that requires them to be connected for 30 days or less, Section 1.1 of Attachment 1 allows the Responsible Entity to include provisions in its plan(s) that allow continuous or on-demand treatment and application of controls independent of the connected state. Please note that for on-demand treatment, the requirements only apply when Transient Cyber Assets and Removable Media are being connected to a BES Cyber System or Protected Cyber Asset. Once the transient device is disconnected, the requirements listed herein are not applicable until that Transient Cyber Asset or Removable Media is to be reconnected to the BES Cyber Asset or Protected Cyber Asset.

The attachment was created to specify the capabilities and possible security methods available to Responsible Entities based upon asset type, ownership, and management.

With the list of options provided in Attachment 1 for each control area, the entity has the discretion to use the option(s) that is most appropriate. This includes documenting its approach for how and when the entity manages or reviews the Transient Cyber Asset under its control or under the control of parties other than the Responsible Entity. The entity should avoid

implementing a security function that jeopardizes reliability by taking actions that would negatively impact the performance or support of the Transient Cyber Asset, BES Cyber Asset, or Protected Cyber Asset.

Vulnerability Mitigation

The terms “mitigate”, “mitigating”, and “mitigation” are used in the sections in Attachment 1 to address the risks posed by malicious code, software vulnerabilities, and unauthorized use when connecting Transient Cyber Assets and Removable Media. Mitigation in this context does not require that each vulnerability is individually addressed or remediated, as many may be unknown or not have an impact on the system to which the Transient Cyber Asset or Removable Media is connected. Mitigation is meant to reduce security risks presented by connecting the Transient Cyber Asset.

Per Transient Cyber Asset Capability

As with other CIP standards, the requirements are intended for an entity to use the method(s) that the system is capable of performing. The use of “per Transient Cyber Asset capability” is to eliminate the need for a Technical Feasibility Exception when it is understood that the device cannot use a method(s). For example, for malicious code, many types of appliances are not capable of implementing antivirus software; therefore, because it is not a capability of those types of devices, implementation of the antivirus software would not be required for those devices.

Requirement R4, Attachment 1, Section 1 - Transient Cyber Asset(s) Managed by the Responsible Entity

Section 1.1: Entities have a high level of control for the assets that they manage. The requirements listed herein allow entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection or use a combination of these methods. The devices may be managed individually or by group.

Section 1.2: Entities are to document and implement their process(es) to authorize the use of Transient Cyber Assets for which they have direct management. The Transient Cyber Assets may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:

1.2.1 User(s), individually or by group/role, allowed to use the Transient Cyber Asset(s). This can be done by listing a specific person, department, or job function. Caution: consider whether these user(s) must also have authorized electronic access to the applicable system in accordance with CIP-004.

1.2.2 Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group of locations.

1.2.3 The intended or approved use of each individual, type, or group of Transient Cyber Asset. This should also include the software or application packages that are authorized with the purpose of performing defined business functions or tasks (e.g., used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes), and approved network interfaces (e.g., wireless,

including near field communication or Bluetooth, and wired connections). Activities, and software or application packages, not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals through the CIP-004 Security Awareness Program and Cyber Security Training Program about authorized and unauthorized activities or uses (e.g., using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).

Entities should exercise caution when using Transient Cyber Assets and ensure they do not have features enabled (e.g., wireless or Bluetooth features) in a manner that would allow the device to bridge an outside network to an applicable system. Doing so would cause the Transient Cyber Asset to become an unauthorized Electronic Access Point in violation of CIP-005, Requirement R1.

Attention should be paid to Transient Cyber Assets that may be used for assets in differing impact areas (i.e., high impact, medium impact, and low impact). These impact areas have differing levels of protection under the CIP requirements, and measures should be taken to prevent the introduction of malicious code from a lower impact area. An entity may want to consider the need to have separate Transient Cyber Assets for each impact level.

Section 1.3: Entities are to document and implement their process(es) to mitigate software vulnerabilities posed by unpatched software through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. Recognizing there is a huge diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in software vulnerability management solutions, options are listed that include the alternative for the entity to use a technology or process that effectively mitigates vulnerabilities.

- Security patching, including manual or managed updates provides flexibility to the Responsible Entity to determine how its Transient Cyber Asset(s) will be used. It is possible for an entity to have its Transient Cyber Asset be part of an enterprise patch process and receive security patches on a regular schedule or the entity can verify and apply security patches prior to connecting the Transient Cyber Asset to an applicable Cyber Asset. Unlike CIP-007, Requirement R2, there is no expectation of creating dated mitigation plans or other documentation other than what is necessary to identify that the Transient Cyber Asset is receiving appropriate security patches.
- Live operating system and software executable only from read-only media is provided to allow a protected operating system that cannot be modified to deliver malicious software. When entities are creating custom live operating systems, they should check the image during the build to ensure that there is not malicious software on the image.
- System hardening, also called operating system hardening, helps minimize security vulnerabilities by removing all non-essential software programs and utilities and only installing the bare necessities that the computer needs to function. While other

programs may provide useful features, they can provide "back-door" access to the system, and should be removed to harden the system.

- When selecting to use other methods that mitigate software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet the software vulnerability mitigation objective.

Section 1.4: Entities are to document and implement their process(es) to mitigate malicious code through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. As with vulnerability management, there is diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in malicious code protections. When addressing malicious code protection, the Responsible Entity should address methods deployed to deter, detect, or prevent malicious code. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

- Antivirus software, including manual or managed updates of signatures or patterns, provides flexibility just as with security patching, to manage Transient Cyber Asset(s) by deploying antivirus or endpoint security tools that maintain a scheduled update of the signatures or patterns. Also, for devices that do not regularly connect to receive scheduled updates, entities may choose to scan the Transient Cyber Asset prior to connection to ensure no malicious software is present.
- Application whitelisting is a method of authorizing only the applications and processes that are necessary on the Transient Cyber Asset. This reduces the opportunity that malicious software could become resident, much less propagate, from the Transient Cyber Asset to the BES Cyber Asset or BES Cyber System.
- Restricted communication to limit the exchange of data to only the Transient Cyber Asset and the Cyber Assets to which it is connected by restricting or disabling serial or network (including wireless) communications on a managed Transient Cyber Asset can be used to minimize the opportunity to introduce malicious code onto the Transient Cyber Asset while it is not connected to BES Cyber Systems. This renders the device unable to communicate with devices other than the one to which it is connected.
- When selecting to use other methods that mitigate the introduction of malicious code to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the introduction of malicious code objective.

Section 1.5: Entities are to document and implement their process(es) to protect and evaluate Transient Cyber Assets to ensure they mitigate the risks that unauthorized use of the Transient Cyber Asset may present to the BES Cyber System. The concern addressed by this section is the possibility that the Transient Cyber Asset could be tampered with, or exposed to malware, while not in active use by an authorized person. Physical security of the Transient Cyber Asset is certainly a control that will mitigate this risk, but other tools and techniques are also available. The bulleted list of example protections provides some suggested alternatives.

- For restricted physical access, the intent is that the Transient Cyber Asset is maintained within a Physical Security Perimeter or other physical location or enclosure that uses physical access controls to protect the Transient Cyber Asset.
- Full disk encryption with authentication is an option that can be employed to protect a Transient Cyber Asset from unauthorized use. However, it is important that authentication be required to decrypt the device. For example, pre-boot authentication, or power-on authentication, provides a secure, tamper-proof environment external to the operating system as a trusted authentication layer. Authentication prevents data from being read from the hard disk until the user has confirmed they have the correct password or other credentials. By performing the authentication prior to the system decrypting and booting, the risk that an unauthorized person may manipulate the Transient Cyber Asset is mitigated.
- Multi-factor authentication is used to ensure the identity of the person accessing the device. Multi-factor authentication also mitigates the risk that an unauthorized person may manipulate the Transient Cyber Asset.
- In addition to authentication and pure physical security methods, other alternatives are available that an entity may choose to employ. Certain theft recovery solutions can be used to locate the Transient Cyber Asset, detect access, remotely wipe, and lockout the system, thereby mitigating the potential threat from unauthorized use if the Transient Cyber Asset was later connected to a BES Cyber Asset. Other low tech solutions may also be effective to mitigate the risk of using a maliciously-manipulated Transient Cyber Asset, such as tamper evident tags or seals, and executing procedural controls to verify the integrity of the tamper evident tag or seal prior to use.
- When selecting to use other methods that mitigate the risk of unauthorized use to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the risk of unauthorized use objective.

Requirement R4, Attachment 1, Section 2 - Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity

The attachment also recognizes the lack of control for Transient Cyber Assets that are managed by parties other than the Responsible Entity. However, this does not obviate the Responsible Entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not manage. The requirements listed herein allow entities the ability to review the assets to the best of their capability and to meet their obligations.

To facilitate these controls, Responsible Entities may choose to execute agreements with other parties to provide support services to BES Cyber Systems and BES Cyber Assets that may involve the use of Transient Cyber Assets. Entities may consider using the Department of Energy Cybersecurity Procurement Language for Energy Delivery dated April 2014. [1] Procurement language may unify the other party and entity actions supporting the BES Cyber Systems and BES Cyber Assets. CIP program attributes may be considered including roles and responsibilities, access controls, monitoring, logging, vulnerability, and patch management along with incident response and back up recovery may be part of the other party's support. Entities should consider the "General Cybersecurity Procurement Language" and "The Supplier's Life Cycle Security Program" when drafting Master Service Agreements, Contracts, and the CIP program processes and controls.

Section 2.1: Entities are to document and implement their process(es) to mitigate software vulnerabilities through the use of one or more of the protective measures listed.

- Conduct a review of the Transient Cyber Asset managed by a party other than the Responsible Entity to determine whether the security patch level of the device is adequate to mitigate the risk of software vulnerabilities before connecting the Transient Cyber Asset to an applicable system.
- Conduct a review of the other party's security patching process. This can be done either at the time of contracting but no later than prior to connecting the Transient Cyber Asset to an applicable system. Just as with reviewing the security patch level of the device, selecting to use this approach aims to ensure that the Responsible Entity has mitigated the risk of software vulnerabilities to applicable systems.
- Conduct a review of other processes that the other party uses to mitigate the risk of software vulnerabilities. This can be reviewing system hardening, application whitelisting, virtual machines, etc.
- When selecting to use other methods to mitigate software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet mitigation of the risk of software vulnerabilities.

[1] http://www.energy.gov/oe/downloads/cybersecurity-procurement-language-energy-delivery-april-2014

Section 2.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more of the protective measures listed.

- Review the use of antivirus software and signature or pattern levels to ensure that the level is adequate to the Responsible Entity to mitigate the risk of malicious software being introduced to an applicable system.
- Review the antivirus or endpoint security processes of the other party to ensure that their processes are adequate to the Responsible Entity to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of application whitelisting used by the other party to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of live operating systems or software executable only from read-only media to ensure that the media is free from malicious software itself. Entities should review the processes to build the read-only media as well as the media itself.
- Review system hardening practices used by the other party to ensure that unnecessary ports, services, applications, etc. have been disabled or removed. This will limit the chance of introducing malicious software to an applicable system.

Section 2.3: Determine whether additional mitigation actions are necessary, and implement such actions prior to connecting the Transient Cyber Asset managed by a party other than the Responsible Entity. The intent of this section is to ensure that after conducting the selected review from Sections 2.1 and 2.2, if there are deficiencies that do not meet the Responsible Entity's security posture, the other party is required to complete the mitigations prior to connecting their devices to an applicable system.

Requirement R4, Attachment 1, Section 3 - Removable Media

Entities have a high level of control for Removable Media that are going to be connected to their BES Cyber Assets.

Section 3.1: Entities are to document and implement their process(es) to authorize the use of Removable Media. The Removable Media may be listed individually or by type.

- Document the user(s), individually or by group/role, allowed to use the Removable Media. This can be done by listing a specific person, department, or job function. Authorization includes vendors and the entity's personnel. Caution: consider whether these user(s) must have authorized electronic access to the applicable system in accordance with CIP-004.
- Locations where the Removable Media may be used. This can be done by listing a specific location or a group/role of locations.

Section 3.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more method(s) to detect malicious code on the Removable Media before it is connected to a BES Cyber Asset. When using the method(s) to detect malicious code, it is expected to occur from a system that is not part of the

BES Cyber System to reduce the risk of propagating malicious code into the BES Cyber System network or onto one of the BES Cyber Assets. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident. Frequency and timing of the methods used to detect malicious code were intentionally excluded from the requirement because there are multiple timing scenarios that can be incorporated into a plan to mitigate the risk of malicious code. The entities must use the method(s) to detect malicious code on Removable Media before it is connected to the BES Cyber Asset. The timing dictated and documented in the entity's plan should reduce the risk of introducing malicious code to the BES Cyber Asset or Protected Cyber Asset.

As a method to detect malicious code, entities may choose to use Removable Media with on-board malicious code detection tools. For these tools, the Removable Media are still used in conjunction with a Cyber Asset to perform the detection. For Section 3.2.1, the Cyber Asset used to perform the malicious code detection must be outside of the BES Cyber System or Protected Cyber Asset.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon Board adoption, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:
The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

Rationale for Requirement R2:
The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

Rationale for Requirement R3:
The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.
The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

Rationale for R4:
Requirement R4 responds to the directive in FERC Order No. 791, at Paragraphs 6 and 136, to address security-related issues associated with Transient Cyber Assets and Removable Media used on a temporary basis for tasks such as data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To mitigate the risks associated with such tools, Requirement R4 was developed to accomplish the following security objectives:

- Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and
- Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.

Requirement R4 incorporates the concepts from other CIP requirements in CIP-010 and CIP-007 to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes: All requirements related to Transient Cyber Assets and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes.

A. Introduction

1. **Title:** Cyber Security — Configuration Change Management and Vulnerability Assessments

2. **Number:** CIP-0~~10-2~~10-3

3. **Purpose:** To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each ~~Special Protection System (SPS) or~~ Remedial Action Scheme (RAS) where the ~~SPS or~~ RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each ~~SPS or~~ RAS where the ~~SPS or~~ RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**:

All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-0~~10-2~~10-3:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for ~~CIP-010-2~~Project 2016-03.

6. Background:

Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show

documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:
Proposed requirement R1 Part 1.6 addresses directives in Order No. 829 for verifying software integrity and authenticity prior to installation in BES Cyber Systems (P. 48).

The objective of verifying software integrity and authenticity is to ensure that the software being installed in the BES Cyber System was not modified without the awareness of the software supplier and is not counterfeit.

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-0~~10-2~~10-3 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-0~~10-2~~10-3 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-0~~10-2~~10-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-0~~10-2~~10-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-0~~10-2~~10-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-0~~10-2~~10-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

CIP-0~~10-2~~10-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.6	High Impact BES Cyber Systems Medium Impact BES Cyber Systems Note: Implementation does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Part 1.6: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.	For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5, and when the method to do so is available to the Responsible Entity from the software source: 1.6.1. Verify the identity of the software source; and 1.6.2. Verify the integrity of the software obtained from the software source.	An example of evidence may include, but is not limited to a change request record that demonstrates the verification of identity of the software source and integrity of the software was performed during the baseline change.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-0~~10-2~~10-3 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-0~~10-2~~10-3 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-0~~10-2~~10-3 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-0~~10-2~~10-3 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-0~~10-2~~10-3 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-0~~10-2~~10-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-0~~10-2~~10-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-0~~10-2~~10-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

R4. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems and associated Protected Cyber Assets, shall implement, except under CIP Exceptional Circumstances, one or more documented plan(s) for Transient Cyber Assets and Removable Media that include the sections in Attachment 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence shall include each of the documented plan(s) for Transient Cyber Assets and Removable Media that collectively include each of the applicable sections in Attachment 1 and additional evidence to demonstrate implementation of plan(s) for Transient Cyber Assets and Removable Media. Additional examples of evidence per section are located in Attachment 2. If a Responsible Entity does not use Transient Cyber Asset(s) or Removable Media, examples of evidence include, but are not limited to, a statement, policy, or other document that states the Responsible Entity does not use Transient Cyber Asset(s) or Removable Media.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	
2	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.
2	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
2	1/21/16	FERC Order issued approving CIP-010-2. Docket No. RM15-14-000	

3	tbd	Modified to address certain directives in FERC Order No. 829.	Revised

CIP-0~~10-2~~10-3 - Attachment 1

Required Sections for Plans for Transient Cyber Assets and Removable Media

Responsible Entities shall include each of the sections provided below in their plan(s) for Transient Cyber Assets and Removable Media as required under Requirement R4.

Section 1. Transient Cyber Asset(s) Managed by the Responsible Entity.

1.1. Transient Cyber Asset Management: Responsible Entities shall manage Transient Cyber Asset(s), individually or by group: (1) in an ongoing manner to ensure compliance with applicable requirements at all times, (2) in an on-demand manner applying the applicable requirements before connection to a BES Cyber System, or (3) a combination of both (1) and (2) above.

1.2. Transient Cyber Asset Authorization: For each individual or group of Transient Cyber Asset(s), each Responsible Entity shall authorize:

1.2.1. Users, either individually or by group or role;

1.2.2. Locations, either individually or by group; and

1.2.3. Uses, which shall be limited to what is necessary to perform business functions.

1.3. Software Vulnerability Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of vulnerabilities posed by unpatched software on the Transient Cyber Asset (per Transient Cyber Asset capability):

- Security patching, including manual or managed updates;
- Live operating system and software executable only from read-only media;
- System hardening; or
- Other method(s) to mitigate software vulnerabilities.

1.4. Introduction of Malicious Code Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the introduction of malicious code (per Transient Cyber Asset capability):

- Antivirus software, including manual or managed updates of signatures or patterns;
- Application whitelisting; or
- Other method(s) to mitigate the introduction of malicious code.

1.5. Unauthorized Use Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of unauthorized use of Transient Cyber Asset(s):

- Restrict physical access;
- Full-disk encryption with authentication;
- Multi-factor authentication; or
- Other method(s) to mitigate the risk of unauthorized use.

Section 2. Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity.

2.1 Software Vulnerabilities Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of vulnerabilities posed by unpatched software on the Transient Cyber Asset (per Transient Cyber Asset capability):

- Review of installed security patch(es);
- Review of security patching process used by the party;
- Review of other vulnerability mitigation performed by the party; or
- Other method(s) to mitigate software vulnerabilities.

2.2 Introduction of malicious code mitigation: Use one or a combination of the following methods to achieve the objective of mitigating malicious code (per Transient Cyber Asset capability):

- Review of antivirus update level;
- Review of antivirus update process used by the party;
- Review of application whitelisting used by the party;
- Review use of live operating system and software executable only from read-only media;
- Review of system hardening used by the party; or
- Other method(s) to mitigate malicious code.

2.3 For any method used to mitigate software vulnerabilities or malicious code as specified in 2.1 and 2.2, Responsible Entities shall determine whether any additional mitigation actions are necessary and implement such actions prior to connecting the Transient Cyber Asset.

Section 3. Removable Media

3.1. Removable Media Authorization: For each individual or group of Removable Media, each Responsible Entity shall authorize:

3.1.1. Users, either individually or by group or role; and

3.1.2. Locations, either individually or by group.

3.2. Malicious Code Mitigation: To achieve the objective of mitigating the threat of introducing malicious code to high impact or medium impact BES Cyber Systems and their associated Protected Cyber Assets, each Responsible Entity shall:

3.2.1. Use method(s) to detect malicious code on Removable Media using a Cyber Asset other than a BES Cyber System or Protected Cyber Assets; and

3.2.2. Mitigate the threat of detected malicious code on Removable Media prior to connecting the Removable Media to a high impact or medium impact BES Cyber System or associated Protected Cyber Assets.

CIP-0~~10-2~~10-3 - Attachment 2

Examples of Evidence for Plans for Transient Cyber Assets and Removable Media

Section 1.1: Examples of evidence for Section 1.1 may include, but are not limited to, the method(s) of management for the Transient Cyber Asset(s). This can be included as part of the Transient Cyber Asset plan(s), part of the documentation related to authorization of Transient Cyber Asset(s) managed by the Responsible Entity or part of a security policy.

Section 1.2: Examples of evidence for Section 1.2 may include, but are not limited to, documentation from asset management systems, human resource management systems, or forms or spreadsheets that show authorization of Transient Cyber Asset(s) managed by the Responsible Entity. Alternatively, this can be documented in the overarching plan document.

Section 1.3: Examples of evidence for Section 1.3 may include, but are not limited to, documentation of the method(s) used to mitigate software vulnerabilities posed by unpatched software such as security patch management implementation, the use of live operating systems from read-only media, system hardening practices or other method(s) to mitigate the software vulnerability posed by unpatched software. Evidence can be from change management systems, automated patch management solutions, procedures or processes associated with using live operating systems, or procedures or processes associated with system hardening practices. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the vendor or Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 1.4: Examples of evidence for Section 1.4 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 1.5: Examples of evidence for Section 1.5 may include, but are not limited to, documentation through policies or procedures of the method(s) to restrict physical access; method(s) of the full-disk encryption solution along with the authentication protocol; method(s) of the multi-factor authentication solution; or documentation of other method(s) to mitigate the risk of unauthorized use.

Section 2.1: Examples of evidence for Section 2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of installed security patch(es); memoranda, electronic mail, policies or contracts from parties other than the Responsible Entity that identify the security patching process or vulnerability mitigation performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail, system documentation or contracts that identifies acceptance by the Responsible Entity that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate software vulnerabilities for Transient Cyber Asset(s) managed by a party other than the Responsible Entity. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 2.2: Examples of evidence for Section 2.2 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed antivirus update level; memoranda, electronic mail, system documentation, policies or contracts from the party other than the Responsible Entity that identify the antivirus update process, the use of application whitelisting, use of live of operating systems or system hardening performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that identifies the Responsible Entity's acceptance that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate malicious code for Transient Cyber Asset(s) managed by a party other than the Responsible Entity. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 2.3: Examples of evidence for Section 2.3 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigations are necessary and that they have been implemented prior to connecting the Transient Cyber Asset managed by a party other than the Responsible Entity.

Section 3.1: Examples of evidence for Section 3.1 may include, but are not limited to, documentation from asset management systems, human resource management systems, forms or spreadsheets that shows authorization of Removable Media. The documentation must identify Removable Media, individually or by group of Removable Media, along with the authorized users,

either individually or by group or role, and the authorized locations, either individually or by group.

Section 3.2: Examples of evidence for Section 3.2 may include, but are not limited to, documented process(es) of the method(s) used to mitigate malicious code such as results of scan settings for Removable Media, or implementation of on-demand scanning. Documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and that show mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included. Custom software installed may include scripts developed for local entity functions or other custom software developed for a specific task or function for the entity's use. If

additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a

major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Software Integrity and Authenticity

The concept of verifying software integrity and authenticity is a key control in preventing the introduction of malware or counterfeit software. This objective is intended to reduce the likelihood that an attacker could exploit legitimate vendor patch management processes to deliver compromised software updates or patches to a BES Cyber System. The intent of the SDT is to provide controls for verifying the baseline elements that are updated by vendors. It is important to note that this is not limited to only security patches. That is why the requirement was not placed in CIP-007 - Security Patch Management.

NIST SP-800-161 includes a number of security controls, which, when taken together, reduce the probability of a successful "Watering Hole" or similar cyber attack in the industrial control system environment and thus could assist in addressing this objective. For example, in the System and Information Integrity (SI) control family, control SI-7 suggests that the integrity of information systems and obtaining software directly from the developer. In the Configuration Management (CM) control family, control CM-5(3) requires that the information system prevent the installation of firmware of software without the verification that the component has been digitally signed to ensure that the hardware and software components are genuine and valid. NIST SP-800-161, while not meant to be definitive, provides examples of controls for addressing this objective. Other controls also could meet this objective.

It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches.

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.
2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.
3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Requirement R4:

Because most BES Cyber Assets and BES Cyber Systems are isolated from external public or untrusted networks, Transient Cyber Assets and Removable Media are a means for cyber-attack. Transient Cyber Assets and Removable Media are often the only way to transport files to and from secure areas to maintain, monitor, or troubleshoot critical systems. To protect the BES Cyber Assets and BES Cyber Systems, entities are required to document and implement a plan for how they will manage the use of Transient Cyber Assets and Removable Media. The approach of defining a plan allows the Responsible Entity to document the processes that are supportable within its organization and in alignment with its change management processes.

Transient Cyber Assets and Removable Media are those devices connected temporarily to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Transient Cyber Assets and Removable Media do not provide BES reliability services and are not part of the BES Cyber Asset to which they are connected. Examples of these temporarily connected devices include, but are not limited to:

- Diagnostic test equipment;
- Packet sniffers;
- Equipment used for BES Cyber System maintenance;
- Equipment used for BES Cyber System configuration; or
- Equipment used to perform vulnerability assessments.

Transient Cyber Assets can be one of many types of devices from a specially-designed device for maintaining equipment in support of the BES to a platform such as a laptop, desktop, or tablet that may just interface with or run applications that support BES Cyber Systems and is capable of transmitting executable code. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

While the definitions of Transient Cyber Asset and Removable Media include a conditional provision that requires them to be connected for 30 days or less, Section 1.1 of Attachment 1 allows the Responsible Entity to include provisions in its plan(s) that allow continuous or on-demand treatment and application of controls independent of the connected state. Please note that for on-demand treatment, the requirements only apply when Transient Cyber Assets and Removable Media are being connected to a BES Cyber System or Protected Cyber Asset. Once the transient device is disconnected, the requirements listed herein are not applicable until that Transient Cyber Asset or Removable Media is to be reconnected to the BES Cyber Asset or Protected Cyber Asset.

The attachment was created to specify the capabilities and possible security methods available to Responsible Entities based upon asset type, ownership, and management.

With the list of options provided in Attachment 1 for each control area, the entity has the discretion to use the option(s) that is most appropriate. This includes documenting its approach for how and when the entity manages or reviews the Transient Cyber Asset under its control or under the control of parties other than the Responsible Entity. The entity should avoid implementing a security function that jeopardizes reliability by taking actions that would negatively impact the performance or support of the Transient Cyber Asset, BES Cyber Asset, or Protected Cyber Asset.

Vulnerability Mitigation

The terms “mitigate”, “mitigating”, and “mitigation” are used in the sections in Attachment 1 to address the risks posed by malicious code, software vulnerabilities, and unauthorized use when connecting Transient Cyber Assets and Removable Media. Mitigation in this context does not require that each vulnerability is individually addressed or remediated, as many may be unknown or not have an impact on the system to which the Transient Cyber Asset or Removable Media is connected. Mitigation is meant to reduce security risks presented by connecting the Transient Cyber Asset.

Per Transient Cyber Asset Capability

As with other CIP standards, the requirements are intended for an entity to use the method(s) that the system is capable of performing. The use of “per Transient Cyber Asset capability” is to eliminate the need for a Technical Feasibility Exception when it is understood that the device cannot use a method(s). For example, for malicious code, many types of appliances are not capable of implementing antivirus software; therefore, because it is not a capability of those types of devices, implementation of the antivirus software would not be required for those devices.

Requirement R4, Attachment 1, Section 1 - Transient Cyber Asset(s) Managed by the Responsible Entity

Section 1.1: Entities have a high level of control for the assets that they manage. The requirements listed herein allow entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection or use a combination of these methods. The devices may be managed individually or by group.

Section 1.2: Entities are to document and implement their process(es) to authorize the use of Transient Cyber Assets for which they have direct management. The Transient Cyber Assets may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:

1.2.1 User(s), individually or by group/role, allowed to use the Transient Cyber Asset(s). This can be done by listing a specific person, department, or job function. Caution: consider whether these user(s) must also have authorized electronic access to the applicable system in accordance with CIP-004.

1.2.2 Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group of locations.

1.2.3 The intended or approved use of each individual, type, or group of Transient Cyber Asset. This should also include the software or application packages that are authorized with the purpose of performing defined business functions or tasks (e.g., used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes), and approved network interfaces (e.g., wireless, including near field communication or Bluetooth, and wired connections). Activities, and software or application packages, not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals through the CIP-004 Security Awareness Program and Cyber Security Training Program about authorized and unauthorized activities or uses (e.g., using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).

Entities should exercise caution when using Transient Cyber Assets and ensure they do not have features enabled (e.g., wireless or Bluetooth features) in a manner that would allow the device to bridge an outside network to an applicable system. Doing so would cause the Transient Cyber Asset to become an unauthorized Electronic Access Point in violation of CIP-005, Requirement R1.

Attention should be paid to Transient Cyber Assets that may be used for assets in differing impact areas (i.e., high impact, medium impact, and low impact). These impact areas have differing levels of protection under the CIP requirements, and measures should be taken to prevent the introduction of malicious code from a lower impact area. An entity may want to consider the need to have separate Transient Cyber Assets for each impact level.

Section 1.3: Entities are to document and implement their process(es) to mitigate software vulnerabilities posed by unpatched software through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. Recognizing there is a huge diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in software vulnerability management solutions, options are listed that include the alternative for the entity to use a technology or process that effectively mitigates vulnerabilities.

- Security patching, including manual or managed updates provides flexibility to the Responsible Entity to determine how its Transient Cyber Asset(s) will be used. It is possible for an entity to have its Transient Cyber Asset be part of an enterprise patch process and receive security patches on a regular schedule or the entity can verify and apply security patches prior to connecting the Transient Cyber Asset to an applicable Cyber Asset. Unlike CIP-007, Requirement R2, there is no expectation of creating dated mitigation plans or other documentation other than what is necessary to identify that the Transient Cyber Asset is receiving appropriate security patches.
- Live operating system and software executable only from read-only media is provided to allow a protected operating system that cannot be modified to deliver malicious software. When entities are creating custom live operating systems, they

should check the image during the build to ensure that there is not malicious software on the image.

- System hardening, also called operating system hardening, helps minimize security vulnerabilities by removing all non-essential software programs and utilities and only installing the bare necessities that the computer needs to function. While other programs may provide useful features, they can provide "back-door" access to the system, and should be removed to harden the system.
- When selecting to use other methods that mitigate software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet the software vulnerability mitigation objective.

Section 1.4: Entities are to document and implement their process(es) to mitigate malicious code through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. As with vulnerability management, there is diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in malicious code protections. When addressing malicious code protection, the Responsible Entity should address methods deployed to deter, detect, or prevent malicious code. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

- Antivirus software, including manual or managed updates of signatures or patterns, provides flexibility just as with security patching, to manage Transient Cyber Asset(s) by deploying antivirus or endpoint security tools that maintain a scheduled update of the signatures or patterns. Also, for devices that do not regularly connect to receive scheduled updates, entities may choose to scan the Transient Cyber Asset prior to connection to ensure no malicious software is present.
- Application whitelisting is a method of authorizing only the applications and processes that are necessary on the Transient Cyber Asset. This reduces the opportunity that malicious software could become resident, much less propagate, from the Transient Cyber Asset to the BES Cyber Asset or BES Cyber System.
- Restricted communication to limit the exchange of data to only the Transient Cyber Asset and the Cyber Assets to which it is connected by restricting or disabling serial or network (including wireless) communications on a managed Transient Cyber Asset can be used to minimize the opportunity to introduce malicious code onto the Transient Cyber Asset while it is not connected to BES Cyber Systems. This renders the device unable to communicate with devices other than the one to which it is connected.
- When selecting to use other methods that mitigate the introduction of malicious code to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the introduction of malicious code objective.

Section 1.5: Entities are to document and implement their process(es) to protect and evaluate Transient Cyber Assets to ensure they mitigate the risks that unauthorized use of the Transient Cyber Asset may present to the BES Cyber System. The concern addressed by this section is the possibility that the Transient Cyber Asset could be tampered with, or exposed to malware, while not in active use by an authorized person. Physical security of the Transient Cyber Asset is certainly a control that will mitigate this risk, but other tools and techniques are also available. The bulleted list of example protections provides some suggested alternatives.

- For restricted physical access, the intent is that the Transient Cyber Asset is maintained within a Physical Security Perimeter or other physical location or enclosure that uses physical access controls to protect the Transient Cyber Asset.
- Full disk encryption with authentication is an option that can be employed to protect a Transient Cyber Asset from unauthorized use. However, it is important that authentication be required to decrypt the device. For example, pre-boot authentication, or power-on authentication, provides a secure, tamper-proof environment external to the operating system as a trusted authentication layer. Authentication prevents data from being read from the hard disk until the user has confirmed they have the correct password or other credentials. By performing the authentication prior to the system decrypting and booting, the risk that an unauthorized person may manipulate the Transient Cyber Asset is mitigated.
- Multi-factor authentication is used to ensure the identity of the person accessing the device. Multi-factor authentication also mitigates the risk that an unauthorized person may manipulate the Transient Cyber Asset.
- In addition to authentication and pure physical security methods, other alternatives are available that an entity may choose to employ. Certain theft recovery solutions can be used to locate the Transient Cyber Asset, detect access, remotely wipe, and lockout the system, thereby mitigating the potential threat from unauthorized use if the Transient Cyber Asset was later connected to a BES Cyber Asset. Other low tech solutions may also be effective to mitigate the risk of using a maliciously-manipulated Transient Cyber Asset, such as tamper evident tags or seals, and executing procedural controls to verify the integrity of the tamper evident tag or seal prior to use.
- When selecting to use other methods that mitigate the risk of unauthorized use to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the risk of unauthorized use objective.

Requirement R4, Attachment 1, Section 2 - Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity

The attachment also recognizes the lack of control for Transient Cyber Assets that are managed by parties other than the Responsible Entity. However, this does not obviate the Responsible Entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent

malicious code on Transient Cyber Assets it does not manage. The requirements listed herein allow entities the ability to review the assets to the best of their capability and to meet their obligations.

To facilitate these controls, Responsible Entities may choose to execute agreements with other parties to provide support services to BES Cyber Systems and BES Cyber Assets that may involve the use of Transient Cyber Assets. Entities may consider using the Department of Energy Cybersecurity Procurement Language for Energy Delivery dated April 2014. [1] Procurement language may unify the other party and entity actions supporting the BES Cyber Systems and BES Cyber Assets. CIP program attributes may be considered including roles and responsibilities, access controls, monitoring, logging, vulnerability, and patch management along with incident response and back up recovery may be part of the other party's support. Entities should consider the "General Cybersecurity Procurement Language" and "The Supplier's Life Cycle Security Program" when drafting Master Service Agreements, Contracts, and the CIP program processes and controls.

Section 2.1: Entities are to document and implement their process(es) to mitigate software vulnerabilities through the use of one or more of the protective measures listed.

- Conduct a review of the Transient Cyber Asset managed by a party other than the Responsible Entity to determine whether the security patch level of the device is adequate to mitigate the risk of software vulnerabilities before connecting the Transient Cyber Asset to an applicable system.
- Conduct a review of the other party's security patching process. This can be done either at the time of contracting but no later than prior to connecting the Transient Cyber Asset to an applicable system. Just as with reviewing the security patch level of the device, selecting to use this approach aims to ensure that the Responsible Entity has mitigated the risk of software vulnerabilities to applicable systems.
- Conduct a review of other processes that the other party uses to mitigate the risk of software vulnerabilities. This can be reviewing system hardening, application whitelisting, virtual machines, etc.
- When selecting to use other methods to mitigate software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet mitigation of the risk of software vulnerabilities.

Section 2.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more of the protective measures listed.

- Review the use of antivirus software and signature or pattern levels to ensure that the level is adequate to the Responsible Entity to mitigate the risk of malicious software being introduced to an applicable system.

[1] http://www.energy.gov/oe/downloads/cybersecurity-procurement-language-energy-delivery-april-2014

- Review the antivirus or endpoint security processes of the other party to ensure that their processes are adequate to the Responsible Entity to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of application whitelisting used by the other party to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of live operating systems or software executable only from read-only media to ensure that the media is free from malicious software itself. Entities should review the processes to build the read-only media as well as the media itself.
- Review system hardening practices used by the other party to ensure that unnecessary ports, services, applications, etc. have been disabled or removed. This will limit the chance of introducing malicious software to an applicable system.

Section 2.3: Determine whether additional mitigation actions are necessary, and implement such actions prior to connecting the Transient Cyber Asset managed by a party other than the Responsible Entity. The intent of this section is to ensure that after conducting the selected review from Sections 2.1 and 2.2, if there are deficiencies that do not meet the Responsible Entity's security posture, the other party is required to complete the mitigations prior to connecting their devices to an applicable system.

Requirement R4, Attachment 1, Section 3 - Removable Media

Entities have a high level of control for Removable Media that are going to be connected to their BES Cyber Assets.

Section 3.1: Entities are to document and implement their process(es) to authorize the use of Removable Media. The Removable Media may be listed individually or by type.

- Document the user(s), individually or by group/role, allowed to use the Removable Media. This can be done by listing a specific person, department, or job function. Authorization includes vendors and the entity's personnel. Caution: consider whether these user(s) must have authorized electronic access to the applicable system in accordance with CIP-004.
- Locations where the Removable Media may be used. This can be done by listing a specific location or a group/role of locations.

Section 3.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more method(s) to detect malicious code on the Removable Media before it is connected to a BES Cyber Asset. When using the method(s) to detect malicious code, it is expected to occur from a system that is not part of the BES Cyber System to reduce the risk of propagating malicious code into the BES Cyber System network or onto one of the BES Cyber Assets. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident. Frequency and timing of the methods used to detect malicious code were intentionally excluded from the requirement because there are multiple timing scenarios that

can be incorporated into a plan to mitigate the risk of malicious code. The entities must use the method(s) to detect malicious code on Removable Media before it is connected to the BES Cyber Asset. The timing dictated and documented in the entity's plan should reduce the risk of introducing malicious code to the BES Cyber Asset or Protected Cyber Asset.

As a method to detect malicious code, entities may choose to use Removable Media with on-board malicious code detection tools. For these tools, the Removable Media are still used in conjunction with a Cyber Asset to perform the detection. For Section 3.2.1, the Cyber Asset used to perform the malicious code detection must be outside of the BES Cyber System or Protected Cyber Asset.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:
The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

Rationale for Requirement R2:
The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

Rationale for Requirement R3:
The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.
The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

Rationale for R4:
Requirement R4 responds to the directive in FERC Order No. 791, at Paragraphs 6 and 136, to address security-related issues associated with Transient Cyber Assets and Removable Media used on a temporary basis for tasks such as data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To mitigate the risks associated with such tools, Requirement R4 was developed to accomplish the following security objectives:

- Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and
- Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.

Requirement R4 incorporates the concepts from other CIP requirements in CIP-010~~-2~~ and CIP-007~~-6~~ to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes: All requirements related to Transient Cyber Assets and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Description of Current Draft

This is the first draft of the proposed standard.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	October 19, 2016
SAR posted for comment	October 20 - November 21, 2016
45-day formal comment period with ballot	January 19 - March 6, 2017

Anticipated Actions	Date
45-day formal comment period with ballot	May 2017
NERC Board (Board) adoption	August 2017

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): None

Upon Board adoption, the rationale boxes will be moved to the Supplemental Material Section.

A. Introduction

1. **Title:** **Cyber Security - Supply Chain Risk Management**

2. **Number:** **CIP-013-1**

3. **Purpose:** To mitigate cyber security risks to the reliable operation of the Bulk Electric System (BES) by implementing security controls for supply chain risk management of BES Cyber Systems.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.3. Generator Operator

   4.1.4. Generator Owner

   4.1.5. Reliability Coordinator

   4.1.6. Transmission Operator

   4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers

4.2.2.1. All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-013-1:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the identification and categorization process required by CIP-002-5, or any subsequent version of that Reliability Standard.

5. Effective Date: See Implementation Plan for Project 2016-03.

B. Requirements and Measures

Rationale for Requirement R1:
The proposed Requirement addresses Order No. 829 directives for entities to implement a plan(s) that includes processes for mitigating cyber security risks in the supply chain. The plan(s) is required to address the following four objectives (Order No. 829 at P. 45):

(1) Software integrity and authenticity;
(2) Vendor remote access;
(3) Information system planning; and
(4) Vendor risk management and procurement controls.

The cyber security risk management plan(s) specified in Requirement R1 apply to high and medium impact BES Cyber Systems.

Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders), consistent with Order No. 829 (P. 36).

Requirement R1 Part 1.1 addresses the directive in Order No. 829 for identification and documentation of cyber security risks in the planning and development processes related to the procurement of BES Cyber Systems (P. 56). The security objective is to ensure entities consider cyber security risks to the BES from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s); and options for mitigating these risks when planning for BES Cyber Systems.

Requirement R1 Part 1.2 addresses the directive in Order No. 829 for procurement controls to address the provision and verification of security concepts in future contracts for BES Cyber Systems (P. 59). The objective of Part 1.2 is for entities to include these topics in their plans so that procurement and contract negotiation processes address the applicable risks. Implementation of elements contained in the entity's plan related to Part 1.2 may be accomplished through the entity's procurement and contract negotiation

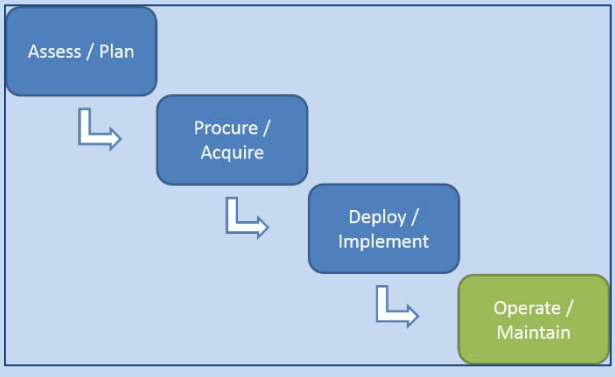
processes. For example, entities can implement the plan by including applicable procurement items from their plan in Requests for Proposals (RFPs) and in negotiations with vendors. Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan. Although the expectation is that Responsible Entities would enforce the security-related provisions in the contract based on the terms and conditions of that contract, such contract enforcement and vendor performance or adherence to the negotiated contract is not subject to this Reliability Standard.

The objective of verifying software integrity and authenticity (Part 1.2.5) is to help ensure that software installed on BES Cyber Systems is not modified prior to installation without the awareness of the software supplier and is not counterfeit. Part 1.2.5 is not an operational requirement for entities to perform such verification; instead, it requires entities to address the software integrity and authenticity issue in its contracting process to provide the entity the means by which to perform such verification under CIP-010-3.

The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contract with to supply BES Cyber Systems and related services. It does not include other NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

Collectively, the provisions of CIP-013-1 address an entity's controls for managing cyber security risks to BES Cyber Systems during the planning, acquisition, and deployment phases of the system life cycle, as shown below.

Notional BES Cyber System Life Cycle



R1. Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber Systems. The plan(s) shall include: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. One or more process(es) used in planning for the procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the Bulk Electric System from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s).

1.2. One or more process(es) used in procuring BES Cyber Systems that address the following, as applicable:

1.2.1. Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

1.2.2. Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

1.2.3. Notification by vendors when remote or onsite access should no longer be granted to vendor representatives;

1.2.4. Disclosure by vendors of known vulnerabilities;

1.2.5. Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System; and

1.2.6. Coordination of controls for (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s).

M1. Evidence shall include one or more documented supply chain cyber security risk management plan(s) as specified in the Requirement.

R2. Each Responsible Entity shall implement its supply chain cyber security risk management plan(s) specified in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

M2. Evidence shall include documentation to demonstrate implementation of the supply chain cyber security risk management plan(s), which could include, but is not limited

to, correspondence, policy documents, or working documents that demonstrate use of the supply chain cyber security risk management plan.

Rationale for Requirement R3:
The proposed requirement addresses Order No. 829 directives for entities to periodically reassess selected supply chain cyber security risk management controls (P. 46).

Entities perform periodic assessment to keep plans up-to-date and address current and emerging supply chain-related concerns and vulnerabilities. Examples of sources of information that the entity could consider include guidance or information issued by:

- NERC or the E-ISAC
- ICS-CERT
- Canadian Cyber Incident Response Centre (CCIRC)

R3. Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Evidence shall include the dated supply chain cyber security risk management plan(s) approved by the CIP Senior Manager or delegate(s) and additional evidence to demonstrate review of the supply chain cyber security risk management plan(s). Evidence may include, but is not limited to, policy documents, revision history, records of review, or workflow evidence from a document management system that indicate review of supply chain risk management plan(s) at least once every 15 calendar months; and documented approval by the CIP Senior Manager or delegate.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s) which include the use of processes in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2, but the plans do not include one of the elements in Part 1.2.1 through Part 1.2.6.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s) which include the use of processes in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2, but the plans do not include two or more of the elements in Part 1.2.1 through Part 1.2.6.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s), but the plan(s) did not include the use of processes in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, or the plan(s) did not include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s), but the plan(s) did not include the use of processes in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and the plan(s) did not include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2. OR The Responsible Entity did not develop one or more documented supply chain cyber security risk management plan(s) as specified in the Requirement.

R2.	N/A	N/A	N/A	The Responsible Entity did not implement its supply chain cyber security risk management plan(s) specified in the requirement.
R3.	The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did so more than 15 calendar months but less than or equal to 16 calendar months since the previous review as specified in the Requirement.	The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did so more than 16 calendar months but less than or equal to 17 calendar months since the previous review as specified in the Requirement.	The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did so more than 17 calendar months but less than or equal to 18 calendar months since the previous review as specified in the Requirement.	The Responsible Entity did not review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) within 18 calendar months of the previous review as specified in the Requirement.

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): None

Upon Board adoption, the rationale boxes will be moved to the Supplemental Material Section.

A. Introduction

1. **Title:** **Cyber Security - Supply Chain Risk Management**

2. **Number:** **CIP-013-1**

3. **Purpose:** To mitigate cyber security risks to the reliable operation of the Bulk Electric System (BES) by implementing security controls for supply chain risk management of BES Cyber Systems.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.3. Generator Operator

   4.1.4. Generator Owner

   4.1.5. Reliability Coordinator

   4.1.6. Transmission Operator

   4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers

4.2.2.1. All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-013-1:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the identification and categorization process required by CIP-002-5, or any subsequent version of that Reliability Standard.

5. Effective Date: See Implementation Plan for Project 2016-03.

B. Requirements and Measures

Rationale for Requirement R1:
The proposed Requirement addresses Order No. 829 directives for entities to implement a plan(s) that includes processes for mitigating cyber security risks in the supply chain. The plan(s) is required to address the following four objectives (Order No. 829 at P. 45):

(1) Software integrity and authenticity;
(2) Vendor remote access;
(3) Information system planning; and
(4) Vendor risk management and procurement controls.

The cyber security risk management plan(s) specified in Requirement R1 apply to high and medium impact BES Cyber Systems.

Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders), consistent with Order No. 829 (P. 36).

Requirement R1 Part 1.1 addresses the directive in Order No. 829 for identification and documentation of cyber security risks in the planning and development processes related to the procurement of BES Cyber Systems (P. 56). The security objective is to ensure entities consider cyber security risks to the BES from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s); and options for mitigating these risks when planning for BES Cyber Systems.

Requirement R1 Part 1.2 addresses the directive in Order No. 829 for procurement controls to address the provision and verification of security concepts in future contracts for BES Cyber Systems (P. 59). The objective of Part 1.2 is for entities to include these topics in their plans so that procurement and contract negotiation processes address the applicable risks. Implementation of elements contained in the entity's plan related to Part 1.2 may be accomplished through the entity's procurement and contract negotiation

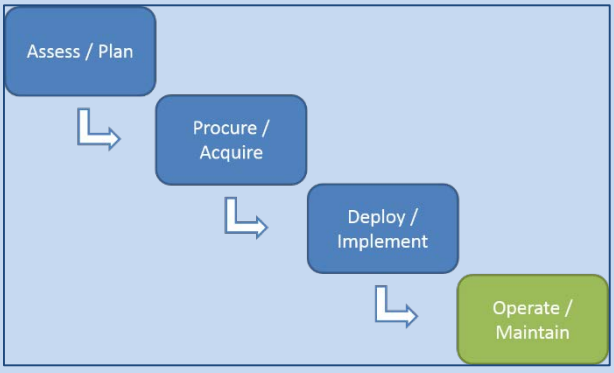
processes. For example, entities can implement the plan by including applicable procurement items from their plan in Requests for Proposals (RFPs) and in negotiations with vendors. Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan. Although the expectation is that Responsible Entities would enforce the security-related provisions in the contract based on the terms and conditions of that contract, such contract enforcement and vendor performance or adherence to the negotiated contract is not subject to this Reliability Standard.

The objective of verifying software integrity and authenticity (Part 1.2.5) is to help ensure that software installed on BES Cyber Systems is not modified prior to installation without the awareness of the software supplier and is not counterfeit. Part 1.2.5 is not an operational requirement for entities to perform such verification; instead, it requires entities to address the software integrity and authenticity issue in its contracting process to provide the entity the means by which to perform such verification under CIP-010-3.

The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contract with to supply BES Cyber Systems and related services. It does not include other NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

Collectively, the provisions of CIP-013-1 address an entity's controls for managing cyber security risks to BES Cyber Systems during the planning, acquisition, and deployment phases of the system life cycle, as shown below.

Notional BES Cyber System Life Cycle



R1. Each Responsible Entity shall ~~implement~~ develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber Systems. ~~that address controls for mitigating cyber security risks to BES Cyber Systems and, if applicable, associated Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets.~~ The plan(s) shall ~~address~~include: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

~~**1.1.** The use of controls in BES Cyber System planning and development to:~~

~~**1.1.1.** Identify and assess risk(s) during the procurement and deployment of vendor products and services; and~~

~~**1.1.2.** Evaluate methods to address identified risk(s).~~

1.1. One or more process(es) used in planning for the procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the Bulk Electric System from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s).

~~**1.2.**~~

~~The use of controls in procuring vendor product(s) or service(s) that address the following items, to the extent each item applies to the Responsible Entity's BES Cyber Systems and, if applicable, associated Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets:~~ ~~The use of~~

1.2. One or more process(es) used in procuring BES Cyber Systems that address the following, as applicable:

1.2.1. ~~Process(es) for notification of vendor security events;~~ Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

~~**1.2.1.**~~**1.2.2.** Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

~~**1.2.2.**~~**1.2.3.** ~~Process(es) for notification when vendor employee remote or onsite access should no longer be granted;~~ Notification by vendors when remote or onsite access should no longer be granted to vendor representatives;

~~**1.2.3.**~~**1.2.4.** ~~Process(es) for disclosure of known vulnerabilities;~~ Disclosure by vendors of known vulnerabilities;

~~**1.2.4.** Coordination of response to vendor-related cyber security incidents;~~

1.2.5. ~~Process(es) for verifying software integrity and authenticity of all software and patches that are intended for use;~~ Verification of software

integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System; and

1.2.6. ~~Coordination of remote access controls for (i) vendor-initiated Interactive Remote Access and (ii) system-to-system remote access with a vendor(s); and~~ Coordination of controls for (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s).

~~1.2.6.~~1.2.7.

~~Other process(es) to address risk(s) as determined in Part 1.1.2, if applicable.~~

M1. Evidence shall include ~~(i)~~ one or more documented supply chain cyber security risk management plan(s) ~~that address controls for mitigating cyber security risks~~ as specified in the Requirement.~~; and (ii) documentation to demonstrate implementation of the supply chain cyber security risk management plan(s), which could include, but is not limited to, written agreements in electronic or hard copy format, correspondence, policy documents, or working documents that demonstrate implementation of the cyber security risk management plan(s).~~

R2. Each Responsible Entity shall implement its supply chain cyber security risk management plan(s) specified in Requirement R1 *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*.

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

~~M1.~~M2. Evidence shall include documentation to demonstrate implementation of the supply chain cyber security risk management plan(s), which could include, but is not limited to, correspondence, policy documents, or working documents that demonstrate use of the supply chain cyber security risk management plan.

Rationale for Requirement ~~R2~~R3:
The proposed requirement addresses Order No. 829 directives for entities to periodically reassess selected supply chain cyber security risk management controls (P. 46).

~~Order No. 829 also directs that the p~~Entities perform periodic assessment ~~"ensure that the required~~to keep plans ~~remains~~ up-to-date and~~,~~ address~~ing~~ current and emerging supply chain-related concerns and vulnerabilities.~~" (P. 47).~~ Examples of sources of information that the entity could consider~~s~~ include guidance or information issued by:

- NERC or the E-ISAC
- ICS-CERT
- Canadian Cyber Incident Response Centre (CCIRC)

~~R2.~~R3. Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval ~~update, as necessary,~~of its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months~~, which shall include:~~. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

~~**2.1.** Evaluation of revisions, if any, to address applicable new supply chain security risks and mitigation measures; and~~

~~**2.2.** Obtaining CIP Senior Manager or delegate approval.~~

~~M2.~~M3. Evidence shall include the dated supply chain cyber security risk management plan(s) approved by the CIP Senior Manager or delegate(s) and additional evidence to demonstrate review of the supply chain cyber security risk management plan(s~~) and evaluation of revisions~~). ~~, if any, to address applicable new supply chain security risks and mitigation measures as specified in the Requirement.~~ Evidence may include, but is not limited to, policy documents, revision history, records of review, or workflow evidence from a document management system that indicate review of supply chain risk management plan(s) at least once every 15 calendar months; and documented approval by the CIP Senior Manager or delegate.

~~**R3.** Each Responsible Entity shall implement one or more documented process(es) for verifying the integrity and authenticity of the following software and firmware before being placed in operation on high and medium impact BES Cyber Systems: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*~~

~~**3.1.** Operating System(s);~~

~~**3.2.** Firmware;~~

~~**3.3.** Commercially available or open-source application software; and~~

~~**3.4.** Patches, updates, and upgrades to 3.1 through 3.3.~~

~~**M3.** Evidence shall include (i) a documented process(es) for verifying the integrity and authenticity of software and firmware before being placed in operation on high and medium impact BES Cyber Systems as specified in the Requirement; and (ii) evidence to show that the process was implemented. This evidence may include, but is not limited to, documentation that the entity performed the actions contained in the process to verify the integrity and authenticity of software and firmware and any patches, updates, and upgrades to software and firmware prior to installation on high and medium impact BES Cyber Systems.~~

R4. Each Responsible Entity shall implement one or more documented process(es) for controlling vendor remote access to high and medium impact BES Cyber Systems. The process(es) shall provide the following for (i) vendor-initiated Interactive Remote Access and (ii) system-to-system remote access with a vendor(s): *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

4.1. Authorization of remote access by the Responsible Entity;

4.2. Logging and monitoring of remote access sessions to detect unauthorized activity; and

4.3. Disabling or otherwise responding to unauthorized activity during remote access sessions.

M4. Evidence shall include (i) a documented process(es) for controlling vendor remote access as specified in the Requirement; and (ii) evidence to show that the process was implemented. This evidence may include, but is not limited to, documentation of authorization of vendor remote access; hard copy or electronic logs of vendor-initiated Interactive Remote Access and system-to-system remote access sessions; hard copy or electronic listing of alert capabilities applicable to vendor remote access of the BES Cyber System; or records of response to unauthorized vendor remote access.

R5. Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BES Cyber Systems shall have one or more documented cyber security policies, which shall be reviewed and approved by the CIP Senior Manager or delegate at least once every 15 calendar months, that address the following topics for its low impact BES Cyber Systems: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

5.1. Integrity and authenticity of software and firmware and any patches, updates, and upgrades to software and firmware; and

5.2. Controlling vendor-initiated remote access, including system-to-system remote access with vendor(s).

M5. Evidence may include, but is not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager or delegate for each cyber security policy.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with

mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s) which include the use of processes in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2, but the plans do not include one of the elements in Part 1.2.1 through Part 1.2.6. ~~N/A~~	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s) which include the use of processes in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2, but the plans do not include two or more of the elements in Part 1.2.1 through Part 1.2.6. ~~N/A~~	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s), but the plan(s) did not include the use of processes in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, or the plan(s) did not include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s), but the plan(s) did not include the use of processes in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and the plan(s) did not include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2. OR The Responsible Entity did not develop ~~The Responsible Entity did not implement~~one or more documented supply chain cyber security risk management plan(s) as specified in the Requirement.

R2.	N/A ~~The Responsible Entity reviewed and updated, as necessary, its supply chain cyber security risk management plan(s) and obtained CIP Senior Manager or delegate approval but did so more than 15 calendar months but less than or equal to 16 calendar months since the previous review as specified in the Requirement.~~	N/A ~~The Responsible Entity reviewed and updated, as necessary, its supply chain cyber security risk management plan(s) and obtained CIP Senior Manager or delegate approval but did so more than 16 calendar months but less than or equal to 17 calendar months since the previous review as specified in the Requirement.~~	N/A ~~The Responsible Entity reviewed and updated, as necessary, its supply chain cyber security risk management plan(s) and obtained CIP Senior Manager or delegate approval but did so more than 17 calendar months but less than or equal to 18 calendar months since the previous review as specified in the Requirement.~~	The Responsible Entity did not implement its supply chain cyber security risk management plan(s) as specified in the requirement.~~The Responsible Entity did not review and update, as necessary, its supply chain cyber security risk management plan(s) and obtain CIP Senior Manager or delegate approval within 18 calendar months of the previous review as specified in the Requirement.~~
R3.	The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did so more than 15 calendar months but less than or equal to 16 calendar months since the previous review as specified in the Requirement.~~N/A~~	The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did so more than 16 calendar months but less than or equal to 17 calendar months since the previous review as specified in the Requirement.~~N/A~~	The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did so more than 17 calendar months but less than or equal to 18 calendar months since the previous review as specified in the Requirement.~~N/A~~	The Responsible Entity did not review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) within 18 calendar months of the previous review as specified in the Requirement.~~The Responsible Entity did not implement one or more documented process(es) for verifying the integrity and authenticity of software and~~

				~~firmware before being placed in operation on high and medium impact BES Cyber Systems as specified in the Requirement.~~

Implementation Plan

Project 2016-03 Cyber Security Supply Chain Risk Management Reliability Standard

Applicable Standard(s)

CIP-005-6 — Cyber Security — Electronic Security Perimeters

CIP-010-3 — Configuration Change Management and Vulnerability Assessments

CIP-013-1 — Cyber Security — Supply Chain Risk Management

Requested Retirement(s)

CIP-005-5 — Cyber Security — Electronic Security Perimeters

CIP-010-2 — Configuration Change Management and Vulnerability Assessments

Prerequisite Standard(s)

None

Applicable Entities

- Balancing Authority
- Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:
  - Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:
  - Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and
  - Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.
  - Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.
  - Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.
- Generator Operator
- Generator Owner
- Reliability Coordinator

- Transmission Operator
- Transmission Owner

Background

On July 21, 2016, the Federal Energy Regulatory Commission (FERC) issued Order No. 829 directing NERC to develop a new or modified Reliability Standard that addresses supply chain risk management for industrial control system hardware, software, and computing and networking services associated with Bulk Electric System (BES) operations. Order No. 829 (at P 2) states:

> [The Commission directs] NERC to develop a forward-looking, objective-based Reliability Standard to require each affected entity to develop and implement a plan that includes security controls for supply chain management for industrial control system hardware, software, and services associated with bulk electric system operations. The new or modified Reliability Standard should address the following security objectives, [discussed in detail in the Order]: (1) software integrity and authenticity; (2) vendor remote access; (3) information system planning; and (4) vendor risk management and procurement controls.

FERC directed NERC to submit the new or modified Reliability Standard(s) within one year of the effective date of Order No. 829, i.e., by September 27, 2017.

General Considerations

Consistent with the directive to develop a forward-looking Reliability Standard, the implementation of Reliability Standards in Project 2016-03 do not require the abrogation or re-negotiation of contracts (including amendments to master agreements and purchase orders) with vendors, suppliers or other entities executed as of the effective date of the proposed Reliability Standards (See FERC Order No. 829, P. 36).

Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in the contract do not determine whether the contract is within scope of CIP-013-1.

Effective Date

For all Reliability Standards in Project 2016-03 — CIP-005-6, CIP-010-3, and CIP-013-1
Where approval by an applicable governmental authority is required, the Reliability Standard shall become effective on the first day of the first calendar quarter that is 18 months after the effective date of the applicable governmental authority's order approving the Reliability Standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the Reliability Standard shall become effective on the first day of the first calendar quarter that is 18 months after the date

the Reliability Standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Initial Performance of Periodic Requirements

CIP-013-1 Requirement R3
The initial review and approval of supply chain cyber security risk management plans by CIP Senior Manager or Delegate pursuant to Requirement R3 must be completed on or before the effective date of CIP-013-1.

Definition

None

Retirement Date

Standards listed in the **Requested Retirement(s)** section shall be retired immediately prior to the effective date in the particular jurisdiction in which the revised standards are becoming effective.

- Transmission Operator
- Transmission Owner

Background

On July 21, 2016, the Federal Energy Regulatory Commission (FERC) issued Order No. 829 directing NERC to develop a new or modified Reliability Standard that addresses supply chain risk management for industrial control system hardware, software, and computing and networking services associated with Bulk Electric System (BES) operations. Order No. 829 (at P 2) states:

> "[The Commission directs] NERC to develop a forward-looking, objective-based Reliability Standard to require each affected entity to develop and implement a plan that includes security controls for supply chain management for industrial control system hardware, software, and services associated with bulk electric system operations. The new or modified Reliability Standard should address the following security objectives, [discussed in detail in the Order]: (1) software integrity and authenticity; (2) vendor remote access; (3) information system planning; and (4) vendor risk management and procurement controls."

FERC directed NERC to submit the new or modified Reliability Standard(s) within one year of the effective date of Order No. 829, i.e., by September 27, 2017.

General Considerations

Consistent with the directive to develop a forward-looking Reliability Standard, the implementation of ~~r~~Reliability ~~s~~Standards in Project 2016-03 ~~CIP-013-1~~ do~~es~~ not require the abrogation or re-negotiation of contracts (including amendments to master agreements and purchase orders) with vendors, suppliers or other entities executed as of the effective date of the proposed Reliability ~~s~~Standards~~CIP-013-1~~ (See FERC Order No. 829, P. 36).

Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in the contract do not determine whether the contract is within scope of CIP-013-1.

Effective Date

~~CIP-013-1 — Cyber Security — Supply Chain Risk Management~~For all Reliability ~~s~~Standards in Project 2016-03 — CIP-005-6, CIP-010-3, and CIP-013-1

Where approval by an applicable governmental authority is required, the Reliability ~~standards~~ Standards ~~s~~ shall become effective on the first day of the first calendar quarter that is ~~twelve (12~~18~~)~~ months after the effective date of the applicable governmental authority's order approving the

Reliability ~~standards~~Standards~~s~~, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the Reliability ~~standards~~ Standards~~s~~ shall become effective on the first day of the first calendar quarter that is ~~twelve (12~~18~~)~~ months after the date the Reliability ~~standards~~ Standards~~s~~ is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Initial Performance of Periodic Requirements

CIP-013-1 Requirement ~~R2~~R3

The initial review and approval ~~and update, as necessary,~~ of supply chain cyber security risk management plans by CIP Senior Manager or Delegate pursuant to Requirement ~~R2~~ R3 must be completed on or before ~~within fifteen (15) calendar months of~~ the effective date of CIP-013-1.

Definition

None

Retirement Date

Standards listed in the **Requested Retirement(s)** section shall be retired immediately prior to the effective date in the particular jurisdiction in which the revised standards are becoming effective.~~None~~

Unofficial Comment Form

Project 2016-03 Cyber Security Supply Chain Risk Management

DO NOT use this form for submitting comments. Use the electronic form to submit comments on the following proposed standards:

- CIP-013-1 – Cyber Security – Supply Chain Risk Management
- CIP-005-6 – Cyber Security – Electronic Security Perimeter(s)
- CIP-010-3 – Cyber Security – Configuration Change Management and Vulnerability Assessments

The electronic comment form must be completed by **8:00 p.m. Eastern, Thursday, June 15, 2017**.

Documents and information about this project are available on the project page. If you have any questions, contact Senior Standards Developer, Mark Olson (via email), or at (404) 446-9760.

Background Information

On July 21, 2016, the Federal Energy Regulatory Commission (Commission) issued Order No. 829 directing NERC to develop a new or modified Reliability Standard that addresses supply chain risk management for industrial control system hardware, software, and computing and networking services associated with Bulk Electric System (BES) operations as follows:

> "[The Commission directs] NERC to develop a forward-looking, objective-based Reliability Standard to require each affected entity to develop and implement a plan that includes security controls for supply chain management for industrial control system hardware, software, and services associated with bulk electric system operations. The new or modified Reliability Standard should address the following security objectives, [discussed in detail in the Order]: (1) software integrity and authenticity; (2) vendor remote access; (3) information system planning; and (4) vendor risk management and procurement controls."

NERC must file the new or revised Standard by September 27, 2017, to meet the one-year deadline established by the Commission in Order No. 829.

The standard drafting team (SDT) has developed the proposed standard and modifications to approved standards to address the above directives.

Questions

You do not have to answer all questions. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

1. The SDT has revised requirements for developing and implementing supply chain cyber security risk management plans (CIP-013-1 Requirements R1 – R3) in response to stakeholder comments. Do you agree with the proposed requirements? If you do not agree, or if you agree but have comments or suggestions for the proposed requirements, please provide your recommendation and explanation.

☐ Yes
☐ No
Comments:

2. The SDT developed proposed CIP-005-6 Requirement R2 Parts 2.4 and 2.5 to address the Order No. 829 directives for controls on vendor-initiated remote access to BES Cyber Systems covering both user-initiated and machine-to-machine vendor remote access. The SDT followed an approach recommended by stakeholders during the initial posting of CIP-013-1. Do you agree with proposed revisions in CIP-005-6? If you do not agree, or if you agree but have comments or suggestions, please provide your recommendation and explanation.

☐ Yes
☐ No
Comments:

3. The SDT developed proposed CIP-010-3 Requirement R1 Part 1.6 to address the Order No. 829 directive for entities to address verification of software integrity and authenticity in the BES Cyber System environment (P 48). The SDT followed an approach recommended by stakeholders during the initial posting of CIP-013-1. Do you agree with proposed revisions in CIP-010-3? If you do not agree, or if you agree but have comments or suggestions for the proposed requirement, please provide your recommendation and explanation.

☐ Yes
☐ No
Comments:

4. The SDT removed low-impact BES Cyber Systems from the applicability in CIP-013-1 and is not proposing any new requirements for these cyber systems. The SDT believes that the proposed applicability to high and medium impact BES Cyber Systems appropriately focuses industry resources on

supply chain cyber security risk management for industrial control system hardware, software, and computing and networking services associated with BES operations, as specified in Order No. 829. Do you agree with the SDT's removal of low impact BES Cyber Systems from CIP-013-1? If you do not agree, or if you agree but have comments or suggestions, please provide your recommendation and explanation.

☐ Yes
☐ No
Comments:

5. The SDT revised the Implementation Plan in response to stakeholder comments. Do you agree with the Implementation Plan for the requirements in Project 2016-03? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan, please provide your recommendation and explanation.

☐ Yes
☐ No
Comments:

6. The SDT revised the Violation Severity Levels (VSLs) for requirements in CIP-013-1, CIP-005-6, and CIP-010-3. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the proposed requirements? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs, please provide your recommendation and explanation.

☐ Yes
☐ No
Comments:

7. The SDT developed draft Implementation Guidance for CIP-013 to provide examples of how a Responsible Entity could comply with the requirements. The draft Implementation Guidance does not prescribe the only approach to compliance. Rather, it describes some approaches the SDT believes would be effective ways to comply with the standard. See NERC's Compliance Guidance policy for information on Implementation Guidance. Do you agree with the example approaches in the draft Implementation Guidance? If you do not agree, or if you agree but have comments or suggestions for the draft Implementation Guidance, please provide your recommendation and explanation.

☐ Yes
☐ No
Comments:

8. The SDT believes proposed CIP-013-1 and the draft Implementation Guidance provide entities with flexibility to meet the reliability objectives in a cost effective manner. Do you agree? If you do not agree, or if you agree but have suggestions for improvement to enable additional cost effective approaches, please provide your recommendation and, if appropriate, technical justification.

☐ Yes
☐ No
Comments:

9. Provide any additional comments for the SDT to consider, if desired.
Comments:

Violation Risk Factor and Violation Severity Level Justifications

Project 2016-03 — Cyber Security — Supply Chain Risk Management

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in **Project 2016-03 — Cyber Security — Supply Chain Risk Management.** Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined by the ERO Sanctions Guidelines. The Cyber Security Supply Chain Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications for CIP-013-01, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	R1 is a requirement in an Operations Planning time horizon to develop one or more documented supply chain cyber security risk management plan(s). If violated, it could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report**

VRF Justifications for CIP-013-01, R1	
Proposed VRF	**Medium**
	This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a new requirement addressing specific reliability goals.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R1 contains only one objective, which is to address an entity's controls for managing cyber security risks to BES Cyber Systems during the planning, acquisition, and deployment phases of the system life cycle. Since the requirement has only one objective, only one VRF was assigned.

VSLs for CIP-013-1, R1			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s) which include the use of processes in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2, but the plans do not include one of the elements in Part 1.2.1 through Part 1.2.6.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s) which include the use of processes in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2, but the plans do not include two or more of the elements in Part 1.2.1 through Part 1.2.6.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s), but the plan(s) did not include the use of processes in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, or the plan(s) did not include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s), but the plan(s) did not include the use of processes in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and the plan(s) did not include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2. OR The Responsible Entity did not develop one or more documented supply chain cyber security risk management plan(s) as specified in the Requirement.

VSL Justifications for CIP-013-1, R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R1 is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

VSL Justifications for CIP-013-1, R1	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology. The VSL is assigned for a single instance of failing to develop one or more documented supply chain cyber security risk management plan(s) that set forth the controls.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	An entity's violation of a single part of the plan specified in the requirement does not constitute a lapse in protection that compromises network security. Therefore a binary VSL is not warranted.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	There is no documentation and implementation interdependence within the requirement.

VRF Justifications for CIP-013-1, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	R2 is a requirement in Operations Planning time horizon that requires entities to implement its supply chain cybersecurity risk management plan(s) specified in Requirement R1. If violated, failing to implement this plan could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a new requirement addressing specific reliability goals.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R2 contains only one objective and only one VRF was assigned. The requirement does not comingle more than one obligation.

VSLs for CIP-013-1, R2			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Responsible Entity did not implement its supply chain cyber security risk management plan(s) as specified in the requirement.

VSL Justifications for CIP-013-1, R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment for R2 is SEVERE which is consistent with binary criteria. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSL is based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	A single VSL of Severe is assigned.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	There is no documentation and implementation interdependence within the requirement.

VRF Justifications for CIP-013-1, R3	
Proposed VRF	**Medium**
NERC VRF Discussion	R3 is a requirement in Operations Planning time horizon that requires the Responsible Entity to periodically review and obtain CIP Senior Manager or delegate approval of supply chain cyber security risk management plans. The reliability objective is to ensure plans remain up to date and address current and emerging supply chain-related cyber security concerns and vulnerabilities. If the requirement is violated, it could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a new requirement addressing specific reliability goals.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R3 contains only one objective and only one VRF was assigned. The requirement does not comingle more than one obligation.

VSLs for CIP-013-1, R3			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did so more than 15 calendar months but less than or equal to 16 calendar months since the previous review as specified in the Requirement.	The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did so more than 16 calendar months but less than or equal to 17 calendar months since the previous review as specified in the Requirement.	The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did so more than 17 calendar months but less than or equal to 18 calendar months since the previous review as specified in the Requirement.	The Responsible Entity did not review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) within 18 calendar months of the previous review as specified in the Requirement.

VSL Justifications for CIP-013-1, R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R1 is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

VSL Justifications for CIP-013-1, R3	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	An entity's violation of the review requirement by some number of months less than 18 calendar months does not constitute a lapse in protection that compromises network security. Therefore a binary VSL is not warranted.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	There is no documentation and implementation interdependence within the requirement.

VRF Justifications for CIP-005-6, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	R2 is a requirement in an Operations Planning and Same Day Operations time horizon to implement one or more documented processes for controlling vendor remote access to high and medium impact BES Cyber Systems. If violated, it could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a revised requirement with the addition of two parts addressing specific reliability goals. The VRF of Medium is consistent with the approved version of the standard.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R2 contains only one objective and only one VRF was assigned. The requirement does not comingle more than one obligation.

VSLs for CIP-005-6, R2			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity does not have documented processes for one or more of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for one of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for two of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for three of the applicable items for Requirement Parts 2.1 through 2.3; OR The Responsible Entity did not have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) (2.4) and one or more methods to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access) (2.5).

VSL Justifications for CIP-005-6, R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.

FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment for R2 is not binary. Guideline 2b: The proposed VSLs do not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5	An entity's violation of a single part of the requirement does not constitute a lapse in protection that compromises network security. Therefore a binary VSL is not warranted.

Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	There is no documentation and implementation interdependence within the requirement.

VRF Justifications for CIP-010-1, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	R1 is a requirement in Operations Planning time horizon that requires the Responsible Entity to implement one or more documented processes that include each of the applicable requirement parts for configuration change management. If violated, it could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** This requirement does not address any of the critical areas identified in the Final Blackout Report.

VRF Justifications for CIP-010-1, R1	
Proposed VRF	**Medium**
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a revised requirement with an additional part to address specific reliability goals. The VRF of Medium is consistent with the approved version of the standard.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R1 contains only one objective and only one VRF was assigned. The requirement does not comingle more than one obligation

FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	There is no documentation and implementation interdependence within the requirement.

Violation Risk Factor and Violation Severity Level Justifications

Project 2016-03 — Cyber Security — Supply Chain Risk Management

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in **Project 2016-03 — Cyber Security — Supply Chain Risk Management.** Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined by the ERO Sanctions Guidelines. The Cyber Security Supply Chain Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications for CIP-013-01, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	R1 is a requirement in an Operations Planning time ~~frame~~ horizon to develop one or more documented supply chain cyber security risk management plan(s). If violated, it could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.

VRF Justifications for CIP-013-01, R1	
Proposed VRF	**Medium**
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a new requirement addressing specific reliability goals.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R1 contains only one objective, which is to address an entity's controls for managing cyber security risks to BES Cyber Systems during the planning, acquisition, and deployment phases of the system life cycle~~develop one or more documented supply chain cyber security risk management plan(s)~~. Since the requirement has only one objective, only one VRF was assigned.

VSLs for CIP-013-1, R1			
Lower	Moderate	High	Severe

The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s) which include the use of processes in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2, but the plans do not include one of the elements in Part 1.2.1 through Part 1.2.6.~~N/A~~	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s) which include the use of processes in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2, but the plans do not include two or more of the elements in Part 1.2.1 through Part 1.2.6.~~N/A~~	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s), but the plan(s) did not include the use of processes in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, or the plan(s) did not include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2.~~The Responsible Entity implemented one or more documented supply chain risk management plan(s), but the plan(s) did not include one of the elements specified in Parts 1.1 or 1.2.~~	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s), but the plan(s) did not include the use of processes in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and the plan(s) did not include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2. OR The Responsible Entity did not develop ~~The Responsible Entity did not implement~~one or more documented supply chain cyber security risk management plan(s) as specified in the Requirement.~~The Responsible Entity implemented one or more documented supply chain risk management plan(s), but the plan(s) did not include either of the elements specified in Parts 1.1 or 1.2.;~~ ~~OR~~ ~~The Responsible Entity did not implement one or more~~

			~~documented supply chain risk management plan(s) as specified in the Requirement.~~

VRF Justifications for CIP-013-1, R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R1 is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF Justifications for CIP-013-1, R1	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology. The VSL is assigned for a single instance of failing to develop one or more documented supply chain cyber security risk management plan(s) that set forth the controls.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	An entity's violation of a single part of the plan specified in the requirement does not constitute a lapse in protection that compromises network security. Therefore a binary VSL is not warranted.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	There is no documentation and implementation interdependence within the requirement.

VRF Justifications for CIP-013-1, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	R2 is a requirement in Operations Planning time ~~frame~~ horizon that requires entities to implement its supply chain cybersecurity risk management plan(s) specified in Requirement R1. If violated, failing to implement this plan could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a new requirement addressing specific reliability goals.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R2 contains only one objective and only one VRF was assigned. The requirement does not comingle more than one obligation.

VSLs for CIP-013-1, R2			
Lower	**Moderate**	**High**	**Severe**
~~The Responsible Entity reviewed and updated, as necessary, its supply chain cyber security risk management plan(s) and obtained CIP Senior Manager or delegate approval but did so more than 15 calendar months but less than or equal to 16 calendar months since the previous review as specified in the Requirement.~~N/A	~~The Responsible Entity reviewed and updated, as necessary, its supply chain cyber security risk management plan(s) and obtained CIP Senior Manager or delegate approval but did so more than 16 calendar months but less than or equal to 17 calendar months since the previous review as specified in the Requirement.~~N/A	~~The Responsible Entity reviewed and updated, as necessary, its supply chain cyber security risk management plan(s) and obtained CIP Senior Manager or delegate approval but did so more than 17 calendar months but less than or equal to 18 calendar months since the previous review as specified in the Requirement.~~N/A	The Responsible Entity did not implement its supply chain cyber security risk management plan(s) as specified in the requirement.~~The Responsible Entity did not review and update, as necessary, its supply chain cyber security risk management plan(s) and obtain CIP Senior Manager or delegate approval within 18 calendar months of the previous review as specified in the Requirement.~~

VSL Justifications for CIP-013-1, R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment for R2 is SEVERE which is consistent with ~~not~~ binary criteria. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for CIP-013-1, R2	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSL~~s are~~ is based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	~~An entity's violation of a single part of the requirement does not constitute a lapse in protection that compromises network security. Table of Contents

Introduction

On July 21, 2016, the Federal Energy Regulatory Commission (FERC) issued Order No. 829 directing the North American Electric Reliability Corporation (NERC) to develop a new or modified Reliability Standard that addresses cyber security supply chain risk management for industrial control system hardware, software, and computing and networking services associated with Bulk Electric System (BES) operations as follows:

> [The Commission directs] NERC to develop a forward-looking, objective-based Reliability Standard to require each affected entity to develop and implement a plan that includes security controls for supply chain management for industrial control system hardware, software, and services associated with bulk electric system operations. The new or modified Reliability Standard should address the following security objectives, [discussed in detail in the Order]: (1) software integrity and authenticity; (2) vendor remote access; (3) information system planning; and (4) vendor risk management and procurement controls.

Reliability Standard **CIP-013-1 – Cyber Security – Supply Chain Risk Management** addresses the relevant cyber security supply chain risks in the planning, acquisition, and deployment phases of the system life cycle for high and medium impact BES Cyber Systems[1].

This implementation guidance provides considerations for implementing the requirements in CIP-013-1 and examples of approaches that responsible entities could use to meet the requirements. The examples do not constitute the only approach to complying with CIP-013-1. Responsible Entities may choose alternative approaches that better fit their situation.

[1] Responsible Entities identify high and medium impact BES Cyber Systems according to the identification and categorization process required by CIP-002-5, or subsequent version of that standard.

Requirement R1

R1. *Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber Systems. The plan(s) shall include:*

1.1. *One or more process(es) used in planning for the procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the Bulk Electric System from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s).*

1.2. *One or more process(es) used in procuring BES Cyber Systems that address the following, as applicable:*

1.2.1. *Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;*

1.2.2. *Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;*

1.2.3. *Notification by vendors when remote or onsite access should no longer be granted to vendor representatives;*

1.2.4. *Disclosure by vendors of known vulnerabilities;*

1.2.5. *Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System; and*

1.2.6. *Coordination of controls for (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s).*

General Considerations for R1

The following are some general considerations for Responsible Entities as they implement Requirement R1:

First, in developing their supply chain cyber security risk management plan(s), Responsible entities should consider how to leverage the various components and phases of their processes (e.g. defined requirements, request for proposal, bid evaluation, external vendor assessment tools and data, third party certifications and audit reports, etc.) to help them meet the objective of Requirement R1 and give them flexibility to negotiate contracts with vendors to efficiently mitigate risks. Focusing solely on the negotiation of specific contract terms could have unintended consequences, including significant and unexpected cost increases for the product or service or vendors refusing to enter into contracts.

Additionally, a Responsible Entity may not have the ability to obtain each of its desired cyber security controls in its contract with each of its vendors. Factors such as competition, limited supply sources, expense, criticality of the product or service, and maturity of the vendor or product line could affect the terms and conditions ultimately negotiated by the parties and included in a contract. This variation in contract terms is anticipated and, in turn, the note in Requirement R2 provides that the actual terms and conditions of the contract are outside the scope of Reliability Standard CIP-013-1.

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the

following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

The focus of Requirement R1 is on the steps the Responsibility Entity takes to consider cyber security risks from vendor products or services during BES Cyber System planning and procurement. In the event the vendor is unwilling to engage in the negotiation process for cyber security controls, the Responsible Entity could explore other sources of supply or mitigating controls to reduce the risk to the BES cyber systems, as the Responsible Entity's circumstances allow.

In developing and implementing its supply chain cyber security risk management plan, a Responsible Entity may consider identifying and prioritizing security controls based on the cyber security risks presented by the vendor and the criticality of the product or service to reliable operations. For instance, Responsible Entities may establish a baseline set of controls for given products or services that a vendor must meet prior to transacting with that vendor for those products and services (i.e., "must-have controls"). As risks differ between products and services, the baseline security controls – or "must haves" – may differ for the various products and services the Responsible Entities procures for its BES Cyber Systems. This risk-based approach could help create efficiencies in the Responsible Entity's procurement processes while meeting the security objectives of Requirement R1.

The objective of addressing the verification of software integrity and authenticity during the procurement phase of BES Cyber System(s) (Part 1.2.5) is to identify the capability of the vendor(s) to ensure that the software installed on BES Cyber System(s) is trustworthy. Part 1.2.5 is not an operational requirement for Responsible Entities to perform the verification; instead, Part 1.2.5 is aimed at identifying during the procurement phase the vendor's capability to provide software integrity and authenticity assurance and establish vendor performance based on the vendor's capability in order to implement CIP-010-3, Requirement R1, Part 1.6.

Implementation Guidance for R1

Responsible entities use various processes as they plan to procure BES Cyber Systems. Below are some examples of approaches to comply with this requirement:

R1. *Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber Systems. The plan(s) shall include:*

- The Responsible Entity could establish one or more documents explaining the process by which the Responsible Entity will address supply chain cyber security risk management for high and medium impact BES Cyber Systems. To achieve the flexibility needed for supply chain cyber security risk management, Responsible Entities can use a "risk-based approach". One element of, or approach to, a risk-based cyber security risk management plan is **system-based**, focusing on specific controls for high and medium impact BES Cyber Systems to address the risks presented in procuring those systems or services for those systems. A risk-based approach could also be **vendor-based**, focusing on the risks posed by various vendors of its BES Cyber Systems. Entities may combine both of these approaches into their plans. This flexibility is important to account for the varying "needs and characteristics of responsible entities and the diversity of BES Cyber System environments, technologies, and risk (FERC Order No. 829 P 44)."

1.1. *One or more process(es) used in planning for the procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the Bulk Electric System from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s).*

A Responsible Entity could document in its supply chain cyber security risk management plan one or more processes that it will use when planning for the procurement of BES Cyber Systems to identify and assess cyber security risks to the Bulk Electric System from vendor products or services as specified in the requirement. Examples of processes, or outcomes of these processes, for complying with Part 1.1 are described below. A Responsible Entity could comply with Part 1.1 using either the first (team review) approach, or the second (risk assessment process) approach, a combination of the two approaches, or another approach determined by the Responsible Entity to comply with Part 1.1.

- A Responsible Entity can develop a process to form a team of subject matter experts from across the organization to participate in the BES Cyber System planning and acquisition process(es). The Responsible Entity should consider the relevant subject matter expertise necessary to meet the objective of Part 1.1 and include the appropriate representation of business operations, security architecture, information communications and technology, supply chain, compliance, and legal. Examples of factors that this team could consider in planning for the procurement of BES Cyber Systems as specified in Part 1.1 include:
  - Cyber security risk(s) to the BES that could be introduced by a vendor in new or planned modifications to BES Cyber Systems.
  - Vendor security processes and related procedures, including: system architecture, change control processes, remote access requirements, and security notification processes.
  - Periodic review processes that can be used with critical vendor(s) to review and assess any changes in vendor's security controls, product lifecycle management, supply chain, and roadmap to identify opportunities for continuous improvement.
  - Vendor use of third party (e.g., product/personnel certification processes) or independent review methods to verify product and/or service security practices.
  - Third-party security assessments or penetration testing provided by the vendors.
  - Vendor supply chain channels and plans to mitigate potential risks or disruptions.
  - Known system vulnerabilities; known threat techniques, tactics, and procedures; and related mitigation measures that could be introduced by vendor's information systems, components, or information system services.
  - Corporate governance and approval processes.
  - Methods to minimize network exposure, e.g., prevent internet accessibility, use of firewalls, and use of secure remote access techniques.
  - Methods to limit and/or control remote access from vendors to Responsible Entity's BES Cyber Systems.
  - Vendor's risk assessments and mitigation measures for cyber security during the planning and procurement process.
  - Mitigating controls that can be implemented by the Responsible Entity of the vendor. Examples include hardening the information system, minimizing the attack surface, ensuring ongoing support for system components, identification of alternate sources for critical components, etc.
- A Responsible Entity can develop a risk assessment process to identify and assess potential cyber security risks resulting from (i) procuring and installing vendor equipment and software and (ii) transitions from one vendor(s) to another vendor(s). This process could consider the following:
  - Potential risks based on the vendor's information systems, system components, and/or information system services / integrators. Examples of considerations include:

- Critical systems, components, or services that impact the operations or reliability of BES Cyber Systems.
- Product components that are not owned and managed by the vendor that may introduce additional risks, such as open source code or components from third party developers and manufacturers.

- Potential risks based on the vendor's risk management controls. Examples of vendor risk management controls to consider include[2]:
  - Personnel background and screening practices by vendors.
  - Training programs and assessments of vendor personnel on cyber security.
  - Formal vendor security programs which include their technical, organizational, and security management practices.
  - Vendor's physical and cyber security access controls to protect the facilities and product lifecycle.
  - Vendor's security engineering principles in (i) developing layered protections; (ii) establishing sound security policy, architecture, and controls as the foundation for design; (iii) incorporating security requirements into the system development lifecycle; (iv) delineating physical and logical security boundaries; (v) ensuring that system developers are training on how to build security software; (vi) tailoring security controls to meet organizational and operational needs; (vii) performing threat modeling to identify use cases, threat agents, attack vectors, and attack patterns as well as compensating controls and design patterns needed to mitigate risk; and (viii) reducing risk to acceptable levels, thus enabling informed risk management decisions. (NIST SP 800-53 SA-8 – Security Engineering Principles).
  - System Development Life Cycle program (SDLC) methodology from design through patch management to understand how cyber security is incorporated throughout the vendor's processes.
  - Vendor certifications and their alignment with recognized industry and regulatory controls.
  - Summary of any internal or independent cyber security testing performed on the vendor products to ensure secure and reliable operations.[3]
  - Vendor product roadmap describing vendor support of software patches, firmware updates, replacement parts and ongoing maintenance support.
  - Identify processes and controls for ongoing management of Responsible Entity and vendor's intellectual property ownership and responsibilities, if applicable. Examples include use of encryption algorithms for securing software code, data and information, designs, and proprietary processes while at rest or in transit.
- Based on risk assessment, identify mitigating controls that can be implemented by the Responsible Entity or the vendor. Examples include hardening the information system, minimizing the attack surface, ensuring ongoing support for system components, identification of alternate sources for critical components, etc.

[2] Tools such as the Standardized Information Gathering (SIG) Questionnaire from the Shared Assessments Program can aid in assessing vendor risk.

[3] For example, a Responsible Entity can request that the vendor provide a Standards for Attestation Engagements (SSAE) No. 18 SOC 2 audit report.

1.2. *One or more process(es) used in procuring BES Cyber Systems that address the following, as applicable:*

A Responsible Entity could document in its supply chain cyber security risk management plan one or more processes that it will use when procuring BES Cyber Systems to address Parts 1.2.1 through 1.2.6. The following are examples of processes, or outcomes of these processes, for complying with Part 1.2.

- Request cyber security terms relevant to applicable Parts 1.2.1 through 1.2.6 in the procurement process (request for proposal (RFP) or contract negotiation) for BES Cyber Systems to ensure that vendors understand the cyber security expectations for implementing proper security controls throughout the design, development, testing, manufacturing, delivery, installation, support, and disposition of the product lifecycle[4].
- During negotiations of procurement contracts or processes with vendors, the Responsible Entity can document the rationale, mitigating controls, or acceptance of deviations from the Responsible Entity's standard cyber security procurement language that is applicable to the vendor's system component, system integrators, or external service providers.

Examples of ways that a Responsible Entity could, through process(es) for procuring BES Cyber Systems required by Part 1.2, comply with Parts 1.2.1 through 1.2.6 are described below.

1.2.1. *Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;*

- In an RFP or during contract negotiations, request that the vendor include in the contract provisions an obligation for the vendor to provide notification of any identified, threatened, attempted or successful breach of vendor's components, software or systems (*e.g.,* "security event") that have potential adverse impacts to the availability or reliability of BES Cyber Systems. Security event notifications to the Responsible Entity should be sent to designated point of contact as determined by the Responsible Entity and vendor. Examples of information to request that vendor's include in notifications to the Responsible Entity are(i) mitigating controls that the Responsible Entity can implement, if applicable (ii) availability of patch or corrective components, if applicable.

1.2.2. *Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;*

- A Responsible Entity and vendor can agree on service level agreements for response to cyber security incidents and commitment from vendor to collaborate with the Responsible Entity in implement mitigating controls and product corrections.
- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor such that, in the event the vendor identifies a vulnerability that has resulted

[4] An example set of baseline supply chain cyber security procurement language for use by BES owners, operators, and vendors during the procurement process can be obtained from the "Cybersecurity Procurement Language for Energy Delivery Systems" developed by the Energy Sector Control Systems Working Group (ESCSWG).

in a cyber security incident related to the products or services provided to the Responsible Entity, the vendor should provide notification to Responsible Entity. The contract could specify that the vendor provide defined information regarding the products or services at risk and appropriate precautions available to minimize risks. Until the cyber security incident has been corrected, the vendor could be requested to perform analysis of information available or obtainable, provide an action plan, provide ongoing status reports, mitigating controls, and final resolution within reasonable periods as agreed on by vendor and Responsible Entity.

1.2.3. *1.2.3. Notification by vendors when remote or onsite access should no longer be granted to vendor representatives;*

- In an RFP or during contract negotiations, request that the vendor include in the contract provisions an obligation for the vendor to provide notification to the Responsible Entity when vendor employee remote or onsite access should no longer be granted. This does not require the vendor to share sensitive information about vendor employees. Circumstances for no longer granting access to vendor employees include: (i) vendor determines that any of the persons permitted access is no longer required, (ii) persons permitted access are no longer qualified to maintain access, or (iii) vendor's employment of any of the persons permitted access is terminated for any reason. Request vendor cooperation in obtaining Responsible Entity notification within a negotiated period of time of such determination. The vendor and Responsible Entity should define alternative methods that will be implemented in order to continue ongoing operations or services as needed.
- If vendor utilizes third parties (or subcontractors) to perform services to Responsible Entity, require vendors to obtain Responsible Entity's prior approval and require third party's adherence to the requirements and access termination rights imposed on the vendor directly.

1.2.4. *Disclosure by vendors of known vulnerabilities;*

- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor for cooperation in obtaining access to summary documentation within a negotiated period of any identified security breaches involving the procured product or its supply chain that impact the availability or reliability of the Responsible Entity's BES Cyber System. Documentation should include a summary description of the breach, its potential security impact, its root cause, and recommended corrective actions involving the procured product.
- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor for cooperation in obtaining, within a negotiated time period after establishing appropriate confidentiality agreement, access to summary documentation of uncorrected security vulnerabilities in the procured product that have not been publicly disclosed. The summary documentation should include a description of each vulnerability and its potential impact, root cause, and recommended compensating security controls, mitigations, and/or procedural workarounds.
- During procurement, review with the vendor summary documentation of publicly disclosed vulnerabilities in the product being procured and the status of the vendor's disposition of those publicly disclosed vulnerabilities.

1.2.5. *Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System; and*

- During procurement, request access to vendor documentation detailing the vendor patch management program and update process for all system components being procured (including third-party hardware, software, and firmware). This documentation should include the vendor's method or recommendation for how the integrity of the patch is validated by Responsible Entity. Ask vendors to describe the processes they use for delivering software and the methods that can be used to verify the integrity and authenticity of the software upon receipt, including systems with preinstalled software.
- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor to provide access to vendor documentation for the procured products (including third-party hardware, software, firmware, and services) regarding the release schedule and availability of updates and patches that should be considered or applied. Documentation should include instructions for securely applying, validating and testing the updates and patches.
- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor to provide appropriate software and firmware updates to remediate newly discovered vulnerabilities or weaknesses within a reasonable period for duration of the product life cycle. Consideration regarding service level agreements for updates and patches to remediate critical vulnerabilities should be a shorter period than other updates. If updates cannot be made available by the vendor within a reasonable period, the vendor should be required to provide mitigations and/or workarounds.
- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor to provide fingerprints or cipher hashes for all software so that the Responsible Entity can verify the values prior to installation on the BES Cyber System to verify the integrity of the software.
- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor such that when third-party software components are provided by the vendor, the vendors provide appropriate updates and patches to remediate newly discovered vulnerabilities or weaknesses of the third-party software components.

1.2.6. *Coordination of controls for (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s).*

- During procurement, request vendors specify specific IP addresses, ports, and minimum privileges required to perform remote access services.
- Request vendors use individual user accounts that can be configured to limit access and permissions.
- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor to maintain their IT assets (hardware, software and firmware) connecting to Responsible Entity network with current updates to remediate security vulnerabilities or weaknesses identified by the original OEM or Responsible Entity.
- During procurement, request vendors document their processes for restricting connections from unauthorized personnel. Vendor personnel are not authorized to disclose or share account credentials, passwords or established connections.
- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor such that for vendor system-to-system connections that may limit the Responsible Entity's capability to authenticate the personnel connecting from the vendor's systems, the vendor will maintain complete and accurate books, user logs, access credential data, records, and other information applicable to connection access activities for a negotiated time period.

Requirement R2

R2. *Each Responsible Entity shall implement its supply chain cyber security risk management plan(s) specified in Requirement R1.*

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

General Considerations for R2

Implementation of the supply chain cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders), consistent with Order No. 829 (P. 36). Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in the contract do not determine whether the contract is within scope of CIP-013-1.

Requirement R3

R3. *Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months.*

General Considerations for R3

In the Requirement R3 review, responsible entities should consider new risks and available mitigation measures, which could come from a variety of sources that include NERC, DHS, and other sources.

Implementation Guidance for R3

Responsible entities use various processes to address this requirement. Below are some examples of approaches to comply with this requirement:

- A team of subject matter experts from across the organization representing appropriate business operations, security architecture, information communications and technology, supply chain, compliance, legal, etc. reviews the supply chain cyber security risk management plan at least once every 15 calendar months to reassess for any changes needed. Sources of information for changes include, but are not limited to:
  - Requirements or guidelines from regulatory agencies
  - Industry best practices and guidance that improve supply chain cyber security risk management controls (e.g. NERC, DOE, DHS, ICS-CERT, Canadian Cyber Incident Response Center (CCIRC), and NIST).
  - Mitigating controls to address new and emerging supply chain-related cyber security concerns and vulnerabilities
  - Internal organizational continuous improvement feedback regarding identified deficiencies, opportunities for improvement, and lessons learned.
- The CIP Senior Manager, or approved delegate, reviews any changes to the supply chain cyber security risk management plan at least once every 15 calendar months. Reviews may be more frequent based on the timing and scope of changes to the supply chain cyber security risk management plan(s). Upon approval of changes to the supply chain cyber security risk management plan(s), the CIP Senior Manager or approved delegate should provide appropriate communications to the affected organizations or individuals. Additionally, communications or training material may be developed to ensure any organizational areas affected by revisions are informed.

Order No. 829 Citation	Directive / Guidance	Resolution
P 43	[the Commission directs] that NERC, pursuant to section 215(d)(5) of the FPA, develop a forward-looking, objective-driven new or modified Reliability Standard to require each affected entity to develop and implement a plan that includes security controls for supply chain management for industrial control system hardware, software, and services associated with bulk electric system operations.	Proposed CIP-013-1 addresses the directive. The purpose of the proposed standard is: *To mitigate cyber security risks to the reliable operation of the Bulk Electric System (BES) by implementing security controls for supply chain risk management of BES Cyber Systems.* CIP-013-1 is applicable to high and medium impact BES Cyber Systems. The proposed applicability appropriately focuses industry resources on supply chain cyber security risk management for industrial control system hardware, software, and computing and networking services associated with BES operations.
P 44	[the Commission directs] NERC to submit the new or modified Reliability Standard within one year of the effective date of this Final Rule. NERC should submit an informational filing [by December 26, 2016] with a plan to address the Commission's directive.	The proposed/modified standard(s) must be filed by September 27, 2017. NERC filed its plan to address the directive on December 15, 2016.
P 45	The plan required by the new or modified Reliability Standard developed by NERC should address, at a minimum, the following four specific security objectives in the context of addressing supply chain management risks: (1) software integrity and authenticity; (2) vendor remote access; (3) information system planning; and (4) vendor risk management and procurement controls. Responsible entities should be required to achieve these four objectives but have the flexibility as to how to reach the objective (i.e., the Reliability Standard should set goals (the	The directive is addressed by Requirements R1, R2, and R3 of proposed CIP-013-1. Requirement R1 specifies that entities must develop, and Requirement R2 specifies that entities must implement, one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber Systems that include one or more process(es) for mitigating

Order No. 829 Citation	Directive / Guidance	Resolution
	"what"), while allowing flexibility in how a responsible entity subject to the Reliability Standard achieves that goal (the "how")).	cyber security risks to BES Cyber Systems. The plans address the four objectives from Order No. 829 (P 45) during the planning, acquisition, and deployment phases of the system life cycle. **Proposed CIP-013-1 Requirement R1** **R1.** Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber Systems. The plan(s) shall include: **1.1.** One or more process(es) used in planning for the procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the Bulk Electric System from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s). **1.2.** One or more process(es) used in procuring BES Cyber Systems that address the following, as applicable: **1.2.1.** Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity; **1.2.2.** Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

Order No. 829 Citation	Directive / Guidance	Resolution
		1.2.3. Notification by vendors when remote or onsite access should no longer be granted to vendor representatives; **1.2.4.** Disclosure by vendors of known vulnerabilities; **1.2.5.** Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System; and **1.2.6.** Coordination of controls for (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s). **Proposed CIP-013-1 Requirement R2** **R2.** Each Responsible Entity shall implement its supply chain cyber security risk management plan(s) specified in Requirement R1.
P 46	The new or modified Reliability Standard should also require a periodic reassessment of the utility's selected controls. Consistent with or similar to the requirement in Reliability Standard CIP-003-6, Requirement R1, the Reliability Standard should require the responsible entity's CIP Senior Manager to review and approve the controls adopted to meet the specific security objectives identified in the Reliability Standard at least every 15 months. This periodic assessment should better ensure that the required plan remains up-to-date, addressing current and emerging supply chain-related concerns and vulnerabilities.	The directive is addressed in proposed CIP-013-1 Requirement R3. **Proposed CIP-013-1 Requirement R3** **R3.** Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months
p 47	Also, consistent with this reliance on an objectives-based approach, and as part of this periodic review and approval, the	The directive is addressed in proposed CIP-013-1 Requirement R3 (shown above) and supporting guidance.

Order No. 829 Citation	Directive / Guidance	Resolution
	responsible entity's CIP Senior Manager should consider any guidance issued by NERC, the U.S. Department of Homeland Security (DHS) or other relevant authorities for the planning, procurement, and operation of industrial control systems and supporting information systems equipment since the prior approval, and identify any changes made to address the recent guidance.	**Proposed CIP-013-1 Rationale for Requirement R3:** Entities perform periodic assessment to keep plans up-to-date and, addressing current and emerging supply chain-related concerns and vulnerabilities. Examples of sources of information that the entity could consider include guidance or information issued by: •NERC or the E-ISAC •ICS-CERT •Canadian Cyber Incident Response Centre (CCIRC) *Implementation Guidance* developed by the drafting team and submitted for ERO endorsement includes example controls.
Objective 1: Software Integrity and Authenticity		
P 48	The new or modified Reliability Standard must address verification of: (1) the identity of the software publisher for all software and patches that are intended for use on BES Cyber Systems; and (2) the integrity of the software and patches before they are installed in the BES Cyber System environment.	The directive is addressed in proposed CIP-013-1 Requirement R1 Part 1.2.5 (discussed above) and CIP-010-3 Requirements R1 Part 1.6. The objective of verifying software integrity and authenticity is to ensure that the software being installed in the BES Cyber System was not modified without the awareness of the software supplier and is not counterfeit. **Proposed CIP-010-3 Requirement R1** **R1.** Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-3 Table R1 – Configuration Change Management*. **1.6.** For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5, and when the method to do so is available to the Responsible Entity from the software source:

Order No. 829 Citation	Directive / Guidance	Resolution
		1.6.1. Verify the identity of the software source; and **1.6.2.** Verify the integrity of the software obtained from the software source.
Objective 2: Vendor Remote Access to BES Cyber Systems		
P 51	The new or modified Reliability Standard must address responsible entities' logging and controlling all third-party (i.e., vendor) initiated remote access sessions. This objective covers both user-initiated and machine-to-machine vendor remote access.	The directive is addressed by proposed CIP-005-6 Requirement R2 Parts 2.4 and 2.5. The objective is to mitigate potential risks of a compromise at a vendor during an active remote access session with a Responsible Entity from impacting the BES. The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. The obligation in Part 2.4 requires entities to have a method to determine active vendor remote access sessions. The objective of Requirement R2 Part 2.5 is for entities to have the ability to rapidly disable active remote access sessions in the event of a system breach. **Proposed CIP-005-6 Requirement R2** **R2.** Each Responsible Entity shall implement one or more documented processes that collectively include the applicable requirement parts, where technically feasible, in CIP-005-6 Table R2 –Remote Access Management.: **2.4** Have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access).

Order No. 829 Citation	Directive / Guidance	Resolution
		2.5 Have one or more method(s) to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access).
P 52	In addition, controls adopted under this objective should give responsible entities the ability to rapidly disable remote access sessions in the event of a system breach.	The directive is addressed by CIP-005-6 Requirement R2 Part 2.5 (above).
Objective 3: Information System Planning and Procurement		
P 56	As part of this objective, the new or modified Reliability Standard must address a responsible entity's CIP Senior Manager's (or delegate's) identification and documentation of the risks of proposed information system planning and system development actions. This objective is intended to ensure adequate consideration of these risks, as well as the available options for hardening the responsible entity's information system and minimizing the attack surface.	The directive is addressed in proposed CIP-013-1 Requirement R1 Part 1.1 (shown above).
Objective 4: Vendor Risk Management and Procurement Controls		
P 59	The new or modified Reliability Standard must address the provision and verification of relevant security concepts in future contracts for industrial control system hardware, software, and computing and networking services associated with bulk electric system operations. Specifically, NERC must address controls for the following topics: (1) vendor security event notification processes; (2) vendor personnel termination notification for employees with access to remote and onsite systems; (3) product/services vulnerability disclosures, such as accounts that are able to bypass authentication or the presence of hardcoded passwords; (4) coordinated incident response activities; and (5) other related aspects of procurement. NERC should also	The directive is addressed in proposed CIP-013-1 Requirement R1 Part 1.2 (shown above).

Order No. 829 Citation	Directive / Guidance	Resolution
	consider provisions to help responsible entities obtain necessary information from their vendors to minimize potential disruptions from vendor-related security events.	

Order No. 829 Citation	Directive / Guidance	Resolution
P 43	[the Commission directs] that NERC, pursuant to section 215(d)(5) of the FPA, develop a forward-looking, objective-driven new or modified Reliability Standard to require each affected entity to develop and implement a plan that includes security controls for supply chain management for industrial control system hardware, software, and services associated with bulk electric system operations.	Proposed CIP-013-1 addresses the directive. The purpose of the proposed standard is: *To mitigate cyber security risks to the reliable operation of the Bulk Electric System (BES) by implementing security controls for supply chain risk management of BES Cyber Systems.* CIP-013-1 is applicable to high and medium impact BES Cyber Systems. The proposed applicability appropriately focuses industry resources on supply chain cyber security risk management for industrial control system hardware, software, and computing and networking services associated with BES operations.
P 44	[the Commission directs] NERC to submit the new or modified Reliability Standard within one year of the effective date of this Final Rule. NERC should submit an informational filing [by December 26, 2016] with a plan to address the Commission's directive.	The proposed/modified standard(s) must be filed by September 27, 2017. NERC filed its plan to address the directive on December 15, 2016.
P 45	The plan required by the new or modified Reliability Standard developed by NERC should address, at a minimum, the following four specific security objectives in the context of addressing supply chain management risks: (1) software integrity and authenticity; (2) vendor remote access; (3) information system planning; and (4) vendor risk management and procurement controls. Responsible entities should be required to achieve these four objectives but have the flexibility as to how to reach the objective (i.e., the Reliability Standard should set goals (the	The directive is addressed by Requirements R1, ~~R3~~R2, ~~R4,~~ and ~~R5~~ R3 of proposed CIP-013-1. Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity; ~~1.4.2.~~1.2.3. ~~Process(es) for n~~Notification by vendors when ~~vendor employee~~ remote or onsite access should no longer be granted to vendor representatives; ~~1.4.3.~~1.2.4. ~~Process(es) for d~~Disclosure by vendors of known vulnerabilities; ~~1.4.4. Coordination of response to vendor-related cyber security incidents;~~ ~~1.4.5.~~1.2.5. ~~Process(es) for verifying~~Verification of software integrity and authenticity of all software and patches provided by the vendor ~~that are intended~~ for use in the BES Cyber System; and ~~1.4.6.~~1.2.6. Coordination of ~~remote access~~ controls for (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s)~~; and Other process(es) to address risk(s) as determined in Part 1.1.2, if applicable~~. **Proposed CIP-013-1 Requirement R2** **R2.** Each Responsible Entity shall implement its supply chain cyber security risk management plan(s) specified in Requirement R1.

Order No. 829 Citation	Directive / Guidance	Resolution
P 46	The new or modified Reliability Standard should also require a periodic reassessment of the utility's selected controls. Consistent with or similar to the requirement in Reliability Standard CIP-003-6, Requirement R1, the Reliability Standard should require the responsible entity's CIP Senior Manager to review and approve the controls adopted to meet the specific security objectives identified in the Reliability Standard at least every 15 months. This periodic assessment should better ensure that the required plan remains up-to-date, addressing current and emerging supply chain-related concerns and vulnerabilities.	The directive is addressed in proposed CIP-013-1 Requirement ~~R2~~R3. **Proposed CIP-013-1 Requirement ~~R2~~R3** **~~R2~~R3.** Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval of ~~update, as necessary,~~ its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months~~, which shall include:~~ ~~**2.1.** Evaluation of revisions, if any, to address applicable new supply chain security risks and mitigation measures; and~~ ~~**2.2.** Obtaining CIP Senior Manager or delegate approval.~~
p 47	Also, consistent with this reliance on an objectives-based approach, and as part of this periodic review and approval, the responsible entity's CIP Senior Manager should consider any guidance issued by NERC, the U.S. Department of Homeland Security (DHS) or other relevant authorities for the planning, procurement, and operation of industrial control systems and supporting information systems equipment since the prior approval, and identify any changes made to address the recent guidance.	The directive is addressed in proposed CIP-013-1 Requirement ~~R2~~ R3 ~~part 2.1~~ (shown above) and supporting guidance. **Proposed CIP-013-1 Rationale for Requirement ~~R2~~R3:** ~~Order No. 829 also directs that the~~Entities perform periodic assessment ~~"ensure that the required~~to keep plans ~~remains~~ up-to-date and, addressing current and emerging supply chain-related concerns and vulnerabilities~~" (P. 47)~~. Examples of sources of information that the entity could consider~~s~~ include guidance or information issued by: •NERC or the E-ISAC •ICS-CERT •Canadian Cyber Incident Response Centre (CCIRC)

Order No. 829 Citation	Directive / Guidance	Resolution
		~~*Technical Guidance and Examples*~~*Implementation Guidance* ~~document~~ developed by the drafting team and submitted for ERO endorsement includes example controls.
Objective 1: Software Integrity and Authenticity		
P 48	The new or modified Reliability Standard must address verification of: (1) the identity of the software publisher for all software and patches that are intended for use on BES Cyber Systems; and (2) the integrity of the software and patches before they are installed in the BES Cyber System environment.	The directive is addressed in proposed CIP-013-1 Requirement R1 Part 1.2.5 (discussed above) and CIP-010-3 Requirements ~~R3~~ R1 ~~and R5~~ Part 1.6~~5.1~~. ~~CIP-013-1 Requirement R3 applies to high and medium impact BES Cyber Systems.~~ The objective of verifying software integrity and authenticity is to ensure that the software being installed in the BES Cyber System was not modified without the awareness of the software supplier and is not counterfeit. **Proposed CIP-~~013~~010-~~1~~ 3 Requirement ~~R3~~R1** **R1.** Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-3 Table R1 – Configuration Change Management*.~~Each Responsible Entity shall implement one or more documented process(es) for verifying the integrity and authenticity of the following software and firmware before being placed in operation on high and medium impact BES Cyber Systems:~~ **1.6.** For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5, and when the method to do so is available to the Responsible Entity from the software source: **1.6.1.** Verify the identity of the software source; and

Order No. 829 Citation	Directive / Guidance	Resolution
		1.6.2. Verify the integrity of the software obtained from the software source.~~Operating System(s);~~ ~~**3.1.** Firmware;~~ ~~**3.2.** Commercially available or open-source application software; and~~ ~~**3.3.** Patches, updates, and upgrades to 3.1 through 3.3.~~ ~~**Proposed CIP-013-1 Requirement R5**~~ ~~**R5.** Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BES Cyber Systems shall have one or more documented cyber security policies, which shall be reviewed and approved by the CIP Senior Manager or delegate at least once every 15 calendar months, that address the following topics for its low impact BES Cyber Systems:~~ ~~**5.1.** Integrity and authenticity of software and firmware and any patches, updates, and upgrades to software and firmware; and...~~
Objective 2: Vendor Remote Access to BES Cyber Systems		
P 51	The new or modified Reliability Standard must address responsible entities' logging and controlling all third-party (i.e., vendor) initiated remote access sessions. This objective covers both user-initiated and machine-to-machine vendor remote access.	The directive is addressed by proposed CIP-~~013~~005-~~1~~6 Requirement ~~R4~~ R2 Parts ~~4.1~~2.4 and ~~4.2~~2.5. The objective is to mitigate potential risks of a compromise at a vendor during an active remote access session with a Responsible Entity from impacting the BES.~~ and Requirement R5 Part 5.2. Requirement R4 applies to high and medium impact BES Cyber Systems.~~

Order No. 829 Citation	Directive / Guidance	Resolution
		~~Requirement R5 applies to low impact BES Cyber Systems.~~ The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. The obligation in Part 2.4 requires entities to have a method to determine active vendor remote access sessions. The objective of Requirement R2 Part 2.5 is for entities to have the ability to rapidly disable active remote access sessions in the event of a system breach. **Proposed CIP-~~013~~005-~~1~~ 6 Requirement ~~R4~~R2** **R2.** Each Responsible Entity shall implement one or more documented processes that collectively include the applicable requirement parts, where technically feasible, in CIP-005-6 Table R2 –Remote Access Management.~~Each Responsible Entity shall implement one or more documented process(es) for controlling vendor remote access to high and medium impact BES Cyber Systems. The process(es) shall provide the following for (i) vendor-initiated Interactive Remote Access and (ii) system-to-system remote access with a vendor(s)~~: ~~**4.1.** Authorization of remote access by the Responsible Entity;~~ ~~**4.2.** Logging and monitoring of remote access sessions to detect unauthorized activity; and~~ ~~**4.3.** Disabling or otherwise responding to unauthorized activity during remote access sessions.~~

Order No. 829 Citation	Directive / Guidance	Resolution
		2.4 Have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access). **2.5** Have one or more method(s) to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access). ~~**Proposed CIP-013-1 Requirement R5**~~ ~~**R5.** Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BES Cyber Systems shall have one or more documented cyber security policies, which shall be reviewed and approved by the CIP Senior Manager or delegate at least once every 15 calendar months, that address the following topics for its low impact BES Cyber Systems:~~ ~~**5.2.** Controlling vendor-initiated remote access, including system-to-system remote access with vendor(s).~~
P 52	In addition, controls adopted under this objective should give responsible entities the ability to rapidly disable remote access sessions in the event of a system breach.	The directive is addressed by CIP-005-6 Requirement ~~R4~~ R2 Part ~~4~~2.~~3~~ 45 (above) ~~and Requirement R5 Part 5.2 (above)~~.
Objective 3: Information System Planning and Procurement		
P 56	As part of this objective, the new or modified Reliability Standard must address a responsible entity's CIP Senior Manager's (or delegate's) identification and documentation of the risks of proposed information system planning and system	The directive is addressed in proposed CIP-013-1 Requirement R1 Part 1.1 (shown above).

Order No. 829 Citation	Directive / Guidance	Resolution
	development actions. This objective is intended to ensure adequate consideration of these risks, as well as the available options for hardening the responsible entity's information system and minimizing the attack surface.	
Objective 4: Vendor Risk Management and Procurement Controls		
P 59	The new or modified Reliability Standard must address the provision and verification of relevant security concepts in future contracts for industrial control system hardware, software, and computing and networking services associated with bulk electric system operations. Specifically, NERC must address controls for the following topics: (1) vendor security event notification processes; (2) vendor personnel termination notification for employees with access to remote and onsite systems; (3) product/services vulnerability disclosures, such as accounts that are able to bypass authentication or the presence of hardcoded passwords; (4) coordinated incident response activities; and (5) other related aspects of procurement. NERC should also consider provisions to help responsible entities obtain necessary information from their vendors to minimize potential disruptions from vendor-related security events.	The directive is addressed in proposed CIP-013-1 Requirement R1 Part 1.2 (shown above).

Standards Announcement

Project 2016-03 Cyber Security Supply Chain Risk Management CIP-005-6, CIP-010-3 and CIP-013-1

Formal Comment Period Open through June 15, 2017
Ballot Pools Open for Additional Members through May 31, 2017

Now Available

A 45-day formal comment period will be open through **8 p.m. Eastern, Thursday, June 15, 2017** for the following standards:

1. **CIP-005-6 - Cyber Security – Electronic Security Perimeter(s);**
2. **CIP-010-3 – Cyber Security — Configuration Change Management and Vulnerability Assessments;** and
3. **CIP-013-1 – Cyber Security – Supply Chain Risk Management**.

The standard drafting team's considerations of the responses received from the last comment period are reflected in the proposed standards.

Commenting

Use the electronic form to submit comments on the standard. If you experience any difficulties using the electronic form, contact Nasheema Santos An unofficial Word version of the comment form is posted on the project page.

Ballot Pools

The existing CIP-013-1 ballot pool was used for all of the ballots associated with this project. The ballot pools for CIP-005-6 and CIP-010-3 have been opened to allow stakeholders to join if they are not existing members. The ballot pools are open through **8 p.m. Eastern, Wednesday, May 31, 2017.** Registered Ballot Body members may join the ballot pools here.

If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern).

- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Initial ballots for CIP-005-6 and CIP-010-3, an additional ballot for CIP-013-1 as well as the non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **June 6-15, 2017**.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Mark Olson (via email), or at (404) 446-9760.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2016-03 Cyber Security Supply Chain Risk Management CIP-005-6, CIP-010-3 and CIP-013-1

Formal Comment Period Open through June 15, 2017
Ballot Pools Open for Additional Members through May 31, 2017

Now Available

A 45-day formal comment period will be open through **8 p.m. Eastern, Thursday, June 15, 2017** for the following standards:

1. **CIP-005-6 - Cyber Security – Electronic Security Perimeter(s);**
2. **CIP-010-3 – Cyber Security — Configuration Change Management and Vulnerability Assessments;** and
3. **CIP-013-1 – Cyber Security – Supply Chain Risk Management**.

The standard drafting team's considerations of the responses received from the last comment period are reflected in the proposed standards.

Commenting

Use the electronic form to submit comments on the standard. If you experience any difficulties using the electronic form, contact Nasheema Santos An unofficial Word version of the comment form is posted on the project page.

Ballot Pools

The existing CIP-013-1 ballot pool was used for all of the ballots associated with this project. The ballot pools for CIP-005-6 and CIP-010-3 have been opened to allow stakeholders to join if they are not existing members. The ballot pools are open through **8 p.m. Eastern, Wednesday, May 31, 2017.** Registered Ballot Body members may join the ballot pools here.

If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern).

- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Initial ballots for CIP-005-6 and CIP-010-3, an additional ballot for CIP-013-1 as well as the non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **June 6-15, 2017**.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Mark Olson (via email), or at (404) 446-9760.

Comment Period Start Date:	5/2/2017
Comment Period End Date:	6/15/2017
Associated Ballots:	2016-03 Cyber Security Supply Chain Risk Management CIP-005-6 IN 1 ST 2016-03 Cyber Security Supply Chain Risk Management CIP-010-3 IN 1 ST 2016-03 Cyber Security Supply Chain Risk Management CIP-013-1 AB 2 ST

There were 101 sets of responses, including comments from approximately 220 different people from approximately 141 companies representing 10 of the Industry Segments as shown in the table on the following pages.

Questions

1. The SDT has revised requirements for developing and implementing supply chain cyber security risk management plans (CIP-013-1 Requirements R1 – R3) in response to stakeholder comments. Do you agree with the proposed requirements? If you do not agree, or if you agree but have comments or suggestions for the proposed requirements, please provide your recommendation and explanation.

2. The SDT developed proposed CIP-005-6 Requirement R2 Parts 2.4 and 2.5 to address the Order No. 829 directives for controls on vendor-initiated remote access to BES Cyber Systems covering both user-initiated and machine-to-machine vendor remote access. The SDT followed an approach recommended by stakeholders during the initial posting of CIP-013-1. Do you agree with proposed revisions in CIP-005-6? If you do not agree, or if you agree but have comments or suggestions, please provide your recommendation and explanation.

3. The SDT developed proposed CIP-010-3 Requirement R1 Part 1.6 to address the Order No. 829 directive for entities to address verification of software integrity and authenticity in the BES Cyber System environment (P 48). The SDT followed an approach recommended by stakeholders during the initial posting of CIP-013-1. Do you agree with proposed revisions in CIP-010-3? If you do not agree, or if you agree but have comments or suggestions for the proposed requirement, please provide your recommendation and explanation.

4. The SDT removed low-impact BES Cyber Systems from the applicability in CIP-013-1 and is not proposing any new requirements for these cyber systems. The SDT believes that the proposed applicability to high and medium impact BES Cyber Systems appropriately focuses industry resources on supply chain cyber security risk management for industrial control system hardware, software, and computing and networking services associated with BES operations, as specified in Order No. 829. Do you agree with the SDT's removal of low impact BES Cyber Systems from CIP-013-1? If you do not agree, or if you agree but have comments or suggestions, please provide your recommendation and explanation.

5. The SDT revised the Implementation Plan in response to stakeholder comments. Do you agree with the Implementation Plan for the requirements in Project 2016-03? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan, please provide your recommendation and explanation.

6. The SDT revised the Violation Severity Levels (VSLs) for requirements in CIP-013-1, CIP-005-6, and CIP-010-3. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the proposed requirements? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs, please provide your recommendation and explanation.

7. The SDT developed draft Implementation Guidance for CIP-013 to provide examples of how a Responsible Entity could comply with the requirements. The draft Implementation Guidance does not prescribe the only approach to compliance. Rather, it describes some approaches the SDT believes would be effective ways to comply with the standard. See NERC's Compliance Guidance policy for information on Implementation Guidance. Do you agree with the example approaches in the draft Implementation Guidance? If you do not agree, or if you agree but have comments or suggestions for the draft Implementation Guidance, please provide your recommendation and explanation.

8. The SDT believes proposed CIP-013-1 and the draft Implementation Guidance provide entities with flexibility to meet the reliability objectives in a cost effective manner. Do you agree? If you do not agree, or if you agree but have suggestions for improvement to enable additional cost effective approaches, please provide your recommendation and, if appropriate, technical justification.

9. Provide any additional comments for the SDT to consider, if desired.

1. The SDT has revised requirements for developing and implementing supply chain cyber security risk management plans (CIP-013-1 Requirements R1 – R3) in response to stakeholder comments. Do you agree with the proposed requirements? If you do not agree, or if you agree but have comments or suggestions for the proposed requirements, please provide your recommendation and explanation.

Aaron Cavanaugh - Bonneville Power Administration - 1,3,5,6 - WECC

Comment

BPA disagrees with the language in Requirement R3 requiring the CIP Senior Manager or delegate approve the supply chain cyber security risk management plans. Other CIP standards, such as CIP-003-6, Requirement R1, require CIP Senior Manager approval of "policies," not "plans." In Order No. 829, the Federal Energy Regulatory Commission stated, "*Consistent with or similar to the requirement in Reliability Standard CIP-003-6, Requirement R1*, the Reliability Standard should require the responsible entity's CIP Senior Manager to review and approve the controls adopted to meet the specific security objectives identified in the Reliability Standard at least every 15 months." Order No. 829 at P46 (emphasis added). Requiring CIP Senior Manager approval of plans is not consistent or similar to requiring approval of policies because plans are more tactical and numerous than policies. CIP Senior Manager approval should apply only to overarching strategic documents, and not to approval of highly detailed plans for implementation of processes. Instead, CIP-013 should be added to the list of policies requiring CIP Senior Manager approval in CIP-003-6, Requirement R1.

Recommend removing those items covered in CIP-005 and CIP-010 from CIP-013. There are substantive requirements being incorporated into CIP standards to perform functions for all BES Cyber Systems (to the extent possible), it is not clear there is a remaining need to for a separate standard requiring that those items be addressed during the procurement process. This appears to apply to software source and identity verification (now required "when the method to do so is available" by CIP-010) and determining active vendor remote access sessions (now required by CIP-005). Having a standard that requires you to perform the underlying function and also to take those functions into account during the procurement process is needless duplication that does not increase security or reliability and could result in compliance "double jeopardy."

The Compliance and/or Implementation Guidance should make clear that, as long as evidence demonstrates that all items expressly identified in CIP-013, R1 are contained in a Supply Chain Cyber Security Management Plan or Plans, and are implemented pursuant to R2, entities will not be found out of compliance. More specifically, entities should not be subjected to CIP-013 noncompliance findings resulting from a difference of opinion concerning security adequacy

GRE supports the NRECA comments.

In R1, NRECA recommends that the SDT reiterate “high and medium impact” each time BES Cyber System is used in the requirement parts. (This would be added to part 1.1, 1.2, and 1.2.5.) We also question why 1.2.1 and 1.2.2 is specific to “products or services provided to the Responsible Entity,” but 1.2.4 is not. We recommend adding this phrase to 1.2.4: “Disclosure by vendors of known vulnerabilities related to products or services provided to the Responsible Entity.”

Further, we recommend further clarification to the term “vendor.” We recommend explaining this term in the Guidelines and Technical Basis (GTB) section rather than the Rationale. The intent of the term “vendor” is not a Rationale for the standard. Additionally, there are a number of potential vendor scenarios which should be clarified in the GTB. The vendor explanation excludes other NERC Registered Entities, but it is not clear whether this exclusion also applies to other utilities not registered with NERC. It is also not clear whether the term vendor is intended to apply to contract employees, particularly those who may be using company issued computer equipment and receiving company developed security training. It would seem that the Transient Cyber Asset requirements already sufficiently mitigate this risk and additional requirements are not necessary. We also find that the term “system integrators” is not well understood and request further clarification.

Comments:

Concerned that the R1 guidance provides details which are beyond the scope of R1

Request re-wording of R1 Part 1.2.1 and 1.2.4 to easily understand what is expected. These Parts appear to be duplicative. Guidance does not adequately distinguish between the Parts. One interpretation is that Part 1.2.1 is for products/services and that Part 1.2.4 is for vulnerabilities in the product. It is not clear if these Parts expect information sharing at the time of procurement or on-going?

In R1 Parts 1.2.1 and 1.2.2, the term “vendor-identified incident” is unclear. It could mean incidents that were identified by another party, specific to the products of a specific vendor. It could mean only incidents identified by the vendor. Suggest changing “identified to “acknowledged” or “confirmed.”

Definition of vendor is not a NERC defined term. The term “vendor” is also used in the proposed CIP-005.

Request more guidance for the term “vendor” and use cases. Guidance should prompt Entities to include their definition of “vendor” in their plan(s).

Recommend removing those items (CIP-013 R1 subparts 1.2.5 and 1.2.6) covered in CIP-005 and CIP-010 from CIP-013. There are substantive requirements being incorporated into CIP standards to perform functions for all BES Cyber Systems (to the extent possible), it is not clear there is a remaining need to for a separate standard requiring that those items be addressed during the procurement process. This appears to apply to software source and identity verification (now required “when the method to do so is available” by CIP-010) and determining active vendor remote access sessions (now required by CIP-005). Having a standard that requires you to perform the underlying function and also to take those functions into account during the procurement process is needless duplication that does not increase security or reliability and could result in compliance “double jeopardy.”

The Compliance and/or Implementation Guidance should make clear that, as long as evidence demonstrates that all items expressly identified in CIP-013, R1 are contained in a Supply Chain Cyber Security Management Plan or Plans, and are implemented pursuant to R2, entities will not be found out of compliance. More specifically, entities should not be subjected to CIP-013 noncompliance findings resulting from a difference of opinion concerning security adequacy.

Is there an expectation of the vendor to disclose non-public information in 1.2.4? Is this only during contracting or is there an expectation of new vulnerabilities to be disclosed?

{C}1.1 – Delete “planning for”. Or if the use of “planning for” in R1 creates a necessary distinction between 1.1 and 1.2, what is it?

- What is implied by *(ii) transitions from one vendor(s) to another vendor(s)*? Why is this distinction necessary? Wouldn’t a vendor transition require a new contract? Does this refer to the act of severing existing remote access permissions? Subcontracting?

-

- R1.2.2: “Coordination of responses to vendor-identified incidents….”, it is not clear who should be doing the coordinating and why this is necessary. Suggest deleting.

Comment	

Texas RE notes that the proposed standard is not responsive to the FERC directive. FERC Order No. 829 P. 59 specifically states "The new or modified Reliability Standard must address the provision and verification of relevant security concepts *in future contracts* for industrial control system hardware, software, and computing and networking services associated with bulk electric system operations." The Note in Requirement R2, however, states: "Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual *terms and conditions of a procurement contract*; and (2) vendor performance and adherence to a contract." Texas RE agrees that it is unreasonable to hold a registered entity accountable for a vendor's adherence to (or lack of adherence to) a contract. Texas RE agrees as the standard drafting team (SDT) claims obtaining specific controls in the negotiated contract may not be feasible at all times but Texas RE believes this is *best practice*. In fact, in most cases contracts for these types of systems typically include security provisions and set similar expectations as described in the standard. The proposed standards would prohibit the compliance monitor from verifying the registered entity implemented part 1.1 and sub-parts 1.2.1 through 1.2.7. Moreover, this verification is to ensure that the registered entities' plans are consistent with the contract's expectations and obligations of the parties.

Admittedly, there will be circumstances in which a contracts may not be consistent or silent as it pertains to the responsible entity's security management plans (e.g. existing contacts or contracts in which the responsible entity was unable to negotiate the appropriate terms into the contract.) In those circumstances, other evidence should be provided demonstrating that the responsible entity has processes to ensure the vendor is expected/obligated to act consistently with the responsible entity's cyber security risk management plans as it relates to the vendor's products or services. Therefore, the contracts should remain in scope as to demonstrate the mapping of expectations from the plan to the contract as far as vendor interactions for those specific items included in the standard and to advance best practices leading to a more reliable BES.

Additionally, Texas RE has the following concerns:

- In the current CIP-013-1 version, the SDT elected to restrict the scope of the Supply Chain process to Medium and High Impact Bulk Electric System (BES) Cyber Systems, as well as exclude Physical Access Controls (PACS), Electronic Access Control and Monitoring Systems (EACMS), and Protected Cyber Assets (PCAs) from the scope of the Standard. In doing so, the SDT appeared to rely on a number of commenters that suggested that FERC Order No. 829, P. 59 excluded these types of devices. Specifically, these commenters pointed to the following language in the FERC Order: "The new or modified Reliability Standard must address the provision and verification of relevant security concepts in future contracts for industrial control system hardware, software, and computing and networking services associated with bulk electric system operations." FERC Order No. 829, P. 59. Accordingly, it appears that the SDT has concluded that PACS, EACMS, and PCAs collectively do not fall within the scope of "industrial control system hardware" or "computing and networking services associated with bulk electric system operations."

Texas RE is concerned PACS, EACMS, and PCAs *do* fall within the scope of "industrial control system hardware" and "computing and networking services associated with bulk electric system operations" as those terms are used in FERC Order No. 829. PACS, EACMS, and PCAs are foundational equipment within a network's architecture. Moreover, these devices are vendor supported and exposed to the precise vulnerabilities identified in FERC's supply chain directive. Given these facts, Texas RE does not believe there is either a basis in FERC Order No. 829 or, more importantly, a reliability-based rationale for excluding them from the scope of CIP-013-1.

- Page 7, Part 1.1: While FERC Order No. 829 specifically uses the term “hardware”, Texas RE notes the word “hardware” is not used in the standard language. Texas RE recommends replacing the word equipment with the term hardware in order to be consistent with the FERC Order.

- Page 8, Section 1.2.6: Texas RE recommends the SDT define or provide examples of the term “*system-to-system remote access*” as this is a broad term which can be interpreted in many different ways.

Comment

Chelan PUD appreciates the efforts of the drafting team to revise CIP-013 in response to comments and recommendations provided previously. Although there are significant improvements in this version of the Draft Standard, CHPD believes that the Standard should not be approved for the following reasons:

- Is not performance based and therefore not auditable
- Creates risk for the responsible entities due to lack of auditability
- Likely to be costly to vendors due to having to respond to various entity contract requests

CHPD has concerns about language related to procurement contracts, in particular use of master agreements, piggyback agreements, and evergreen agreements. To address these concerns and position CIP-013 as a performance based Standard, CHPD recommends that all references to “contracts” and most references to “procurement” be struck from CIP-013. However; the note in R2 should be maintained that states:

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

CHPD’s reasoning is that there are means other than vendor contract negotiations, contract language, and procurement processes to address and achieve the protections required by R1.2. It is immaterial how these protections are achieved. Focusing thinking and audit approach on contracts and procurement (even if specific contract terms are not in scope) limits flexibility, is unnecessarily prescriptive, and does not reflect performance-based principles. As such CHPD asks that R1.2 be revised as follows:

1.2. *One or more process(es)* ***for its newly procured*** *BES Cyber Systems that address the following* ***elements****, as applicable:*

(“new” meaning obtained after the implementation of CIP-013).

Note also that CHPD asks that the term “elements” be included in R1.2, as shown above, to clearly align with the VSLs for this requirement.

Associated guidance in the “Rationale for R1” and in the separate implementation guidance should be revised to reflect the change to a performance-based requirement in which contract terms and contract negotiations play no function in auditing. Contract terms might be used by an entity as evidence of performance, but there should be no expectation by audits in the Standard or implementation guidance that anything having to do with contracts or procurement processes is required. Ultimately, there should be no expectation that the protections be achieved solely through the procurement process. The objective is achieving each protection, not in how it is achieved.

The performance-based assessment requirements would be improved if worded in a way that allows the acceptance of any outcome reached by each Responsible Entity (e.g., “Each Responsible Entity shall and document the results of the assessment.”). The intent should be to create a dialog between the entities and vendors on these topics rather than just documented within contractual language.

Chelan PUD appreciates the efforts of the drafting team to revise CIP-013 in response to comments and recommendations provided previously. Although there are significant improvements in this version of the Draft Standard, CHPD believes that the Standard should not be approved for the following reasons:

- Is not performance based and therefore not auditable
- Creates risk for the responsible entities due to lack of auditability
- Likely to be costly to vendors due to having to respond to various entity contract requests

CHPD has concerns about language related to procurement contracts, in particular use of master agreements, piggyback agreements, and evergreen agreements. To address these concerns and position CIP-013 as a performance based Standard, CHPD recommends that all references to “contracts” and most references to “procurement” be struck from CIP-013. However; the note in R2 should be maintained that states:

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

CHPD’s reasoning is that there are means other than vendor contract negotiations, contract language, and procurement processes to address and achieve the protections required by R1.2. It is immaterial how these protections are achieved. Focusing thinking and audit approach on contracts and procurement (even if specific contract terms are not in scope) limits flexibility, is unnecessarily prescriptive, and does not reflect performance-based principles. As such CHPD asks that R1.2 be revised as follows:

1.2. *One or more process(es)* ***for its newly procured*** *BES Cyber Systems that address the following* ***elements****, as applicable:*

(“new” meaning obtained after the implementation of CIP-013).

Note also that CHPD asks that the term “elements” be included in R1.2, as shown above, to clearly align with the VSLs for this requirement.

Associated guidance in the “Rationale for R1” and in the separate implementation guidance should be revised to reflect the change to a performance-based requirement in which contract terms and contract negotiations play no function in auditing. Contract terms might be used by an entity as evidence of performance, but there should be no expectation by audits in the Standard or implementation guidance that anything having to do with contracts or procurement processes is required. Ultimately, there should be no expectation that the protections be achieved solely through the procurement process. The objective is achieving each protection, not in how it is achieved.

The performance-based assessment requirements would be improved if worded in a way that allows the acceptance of any outcome reached by each Responsible Entity (e.g., “Each Responsible Entity shall <insert performance activity> and document the results of the assessment.”). The intent should be to create a dialog between the entities and vendors on these topics rather than just documented within contractual language.

In the Response to Comments the SDT asserts “Identifying and assessing cyber security risks in BES Cyber System planning. The SDT revised CIP-013-1 Requirement R1 Part 1.1 to “specify risks that Responsible Entities shall consider in planning for procurement of BES Cyber Systems“. Previously, commenters indicated that “the scope of cyber security risks being addressed in R1 is unclear**”**. The SDT removed unnecessary and unclear wording from Requirement R1s main requirement and revised Requirement R1 Part 1.1 to clarify the supply chain cyber security risks that must be addressed by the Responsible Entity in planning for the procurement of BES Cyber Systems.”

This change does not clearly identify the risks as previously noted by commenters.

Dominion recommends the following language change for CIP-013-1, R1 Part 1.1:

“Include one or more process(es) used in planning for the procurement of BES Cyber Systems to identify and assess, if applicable, the cyber security risk(s) of (i) procuring and installing vendor equipment and software; (ii) network architecture security; and (iii) transitions between vendor”

Dominion also recommends the following proposed language change for CIP-013-1 R1 Part 1.2:

“One or more process(es) used during procurement of BES Cyber Systems that address the following, as applicable:”

R3 needs to contain the caveat found in R2 that “[Revision] of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders).”

Comment	

The intent and purpose of CIP-013 is very dependent upon the Implementation Guidance document. We appreciate the hard work of the SDT to provide this document to industry and it has valuable information. A concern is that auditors can only audit to the requirements within the standard so some of the comments are based on needing more clarification within the standard itself.

Language should be included in the standard (not just in the Rationale) that allows for inclusion of a clause in a procurement agreement stating that CIP-013 compliance must be met by the supplier unless it is either not offered or would significantly increase the cost of the agreement. (See CIP-013-1, Section B, Rationale for Requirement R1). This language in a procurement agreement, along with the supplier's stipulation that this compliance is either unavailable or will increase costs should constitute proof that CIP-013 compliance was considered by the Registered Entity but waived due to the supplier's inability to accommodate the requirement in a reasonable manner.

The standard should make clear that, as long as evidence demonstrates that all items expressly identified in CIP-013, R1 are contained in a supply chain cyber security risk management plan or plans, and are implemented pursuant to R2, entities will not be found out of compliance. More specifically, entities should not be subjected to CIP-013 noncompliance findings resulting from a difference of opinion concerning security adequacy.

Santee Cooper is concerned about compliance obligations for procurement activities associated with multi-party wide-area contracts, master agreements and piggyback agreements. An exception, comparable to a CIP Exceptional Circumstance, should be included in the standard for these kinds of procurement activities.

This standard will create the need for entities to have an inventory tracking mechanism of products that are purchased under the supply chain risk management plan. For example, switches could be purchased for use in an IT department, not under the supply chain cyber security risk management plan, and this would preclude it from being used in a BES Cyber System. A CIP Exceptional circumstance or something similar should be added to the standard to allow an entity to use a piece of equipment not procured under the supply chain cyber security risk management plan rather than risk reliability of the BES.

Please add some wording to the requirement in the standard to address how far up the supply chain the plan applies to. If a laptop is purchased from a vendor is there an expectation that the cyber security risk management plan stop with that vendor or is there an expectation that the associated parts of the laptop fall under the plan? It's currently included in the rationale language but the rationale language cannot be audited.

What happens when a vendor is bought out by another vendor? Are you compliant until you have to negotiate a contract with the new vendor?

In R1 Parts 1.2.1 and 1.2.2, the term "vendor-identified incident" is unclear. It could mean incidents that were identified by another party, specific to the products of a specific vendor. It could mean only incidents identified by the vendor. Suggest changing "identified to "acknowledged" or "confirmed."

Recommend modifying CIP-007 and CIP-010 to include the proposed risk management elements proposed in CIP-013, or take the corresponding elements out of CIP-007 and CIP-010 to make CIP-013 more than just having a plan. There are no quantifiable measures in CIP-013 that really justify it as a stand-alone standard.

Comment
Even though ReliabilityFirst believes the CIP-013-1 draft standard address directives from Federal Energy Regulatory Commission (FERC) Order No. 829 and is a positive step in addressing cyber supply chain management, ReliabilityFirst Abstains mainly due to Requirement R1 missing Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS), and Protected Cyber Assets (PCAs). ReliabilityFirst offers the following specific comments for consideration. 1. Requirement R1 i. Even though Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS), and Protected Cyber Assets (PCAs) were not specifically called out specifically in FERC Order 829, ReliabilityFirst believes the SDT needs to examine the possible risk of not including EACMS, PACS and PCA as part of Requirement R1 and go beyond what was stated in FERC Order 829. EACMs and PACS are critical cyber assets that control access and monitoring into the entities' ESPs and PSPs and should follow the Supply Chain standard/requirements as do the High and Medium Impact Cyber Systems. As for the PCAs, if they are compromised due to a vulnerability in the vendors supplied hardware or software, they can possibly affect high and medium impact BES Cyber Systems. ReliabilityFirst offers the following modifications for consideration: a. Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber System and, [if applicable, associated Electronic Access Control and Monitoring (EACM), Physical Access Control Systems (PACS) and Protected Cyber Assets (PCA)]. The plan(s) shall include:

Patricia Robertson - BC Hydro and Power Authority - 1, Group Name BC Hydro	
Answer	No
Document Name	

Comment

- BC Hydro appreciates the direction of the revisions ie to remove enforcement actions against responsible entities that have limited ability to influence vendors. However, BC Hydro still believes some aspects of R1 will be difficult to manage / enforce, especially given the breadth of vendors many responsible entities have associated with their BCAs. Not all vendors are going to be able to accommodate the asks of the requirement.

- "Notification by the vendor…" suggests the vendor is expected to reach out to the responsible entity, and communication / transparency is endorsed through potential inclusion of terms in RFP's / contracts. This relies on the vendor honesty / transparency and there is no way to verify their attestations. The requirement focuses on entities reviewing vendor processes which may have limited impact on reliability.

The clarification that we don't have and would like from NERC/WECC is the intent of the following statement in CIP-013 R1.2.5 ***"Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System".*** There is no Guidelines and technical basis at the end of the standard for this

This has a very large implication as this says all software provided by a vendor has to perform an integrity and authenticity verification.

This could implicate a dedicated channel from the vendor validating through software certificates which would imply entities forcing software vendors to provide this mechanism, which the likelihood of meeting this for MS, Symantec, (non-control system software) is slim. MD5 checksums can not validate the integrity of the software as this hashing mechanism was broken in 2005 (although a lot of software vendors still use it).

Requirement R1.

Oncor agrees with the concept; however, Oncor believes the language for R1.1 should be revised as follows, *"(i) Responsible Entity procures and installs vendor equipment and software"*; and *"(ii) Responsible Entity transitions from one vendor(s) product or service to another vendor(s) product or service".*

For Requirement 1.2.1., the current wording suggests that the vendor has sufficient knowledge of Oncor's environment to know that a particular vulnerability does in fact pose a security risk to Oncor. We offer a recommendation on the language, *"Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that could pose cyber security risk to the Responsible Entity;"*

Requirement 1.2.2. The current phrase "coordination of response" is not clear as to what is intended by "coordination". We offer a recommendation on the language, *"Coordination of response activities by the vendor and the Responsible Entity to address vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;"*

Requirement 1.2.3. The current wording suggests that the vendor has sufficient knowledge of Oncor to determine whether or not an individual should no longer be granted access. Oncor is the only party to an agreement that has the ability to determine who should or should not have access. We offer a recommendation on the language, *"Circumstances where vendors should notify the Responsible Entity that access requirements of the vendor or third party personnel has changed, based on CIP-004, R5."*

Requirement 1.2.4. The current wording is not clear as to which vulnerabilities are applicable. We offer a recommendation on the language, *"Disclosure by vendors of known vulnerabilities in the procured product or service that follows a responsible disclosure process";* Guidance should also be added to reference US-CERT, NIST, or other industry sources.

Requirement 1.2.6. Oncor suggests the following wording change as the use of the phrase "Coordination of controls" is confusing. We offer a recommendation on the language, *"Controls for; (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s)."*

BPA disagrees with the language in Requirement R3 requiring the CIP Senior Manager or delegate approve the supply chain cyber security risk management plans. Other CIP standards, such as CIP-003-6, Requirement R1, require CIP Senior Manager approval of "policies," not "plans." In Order No. 829, the Federal Energy Regulatory Commission stated, "*Consistent with or similar to the requirement in Reliability Standard CIP-003-6, Requirement R1*, the Reliability Standard should require the responsible entity's CIP Senior Manager to review and approve the controls adopted to meet the specific security objectives identified in the Reliability Standard at least every 15 months." Order No. 829 at P46 (emphasis added). Requiring CIP Senior Manager approval of plans is not consistent or similar to requiring approval of policies because plans are more tactical and numerous than policies. CIP Senior Manager approval should apply only to overarching strategic documents, and not to approval of highly detailed plans for implementation of processes. Instead, CIP-013 should be added to the list of policies requiring CIP Senior Manager approval in CIP-003-6, Requirement R1.

In R1, NRECA recommends that the SDT reiterate “high and medium impact” each time BES Cyber System is used in the requirement parts. (This would be added to part 1.1, 1.2, and 1.2.5.) We also question why 1.2.1 and 1.2.2 is specific to “products or services provided to the Responsible Entity,” but 1.2.4 is not. We recommend adding this phrase to 1.2.4: “Disclosure by vendors of known vulnerabilities related to products or services provided to the Responsible Entity.”

Further, we recommend further clarification to the term “vendor.” We recommend explaining this term in the Guidelines and Technical Basis (GTB) section rather than the Rationale. The intent of the term “vendor” is not a Rationale for the standard. Additionally, there are a number of potential vendor scenarios which should be clarified in the GTB. The vendor explanation excludes other NERC Registered Entities, but it is not clear whether this exclusion also applies to other utilities not registered with NERC. It is also not clear whether the term vendor is intended to apply to contract employees, particularly those who may be using company issued computer equipment and receiving company developed security training. It would seem that the Transient Cyber Asset requirements already sufficiently mitigate this risk and additional requirements are not necessary. We also find that the term “system integrators” is not well understood and request further clarification.

Comment

Requirements R1 and R2 essentially shift the burden for ensuring that BES Cyber System hardware and software vendors, resellers, and integrators follow sound security management practices onto individual Responsible Entities, which N&ST considers both unfair and unreasonable, for small entities in particular. The just-endorsed (by NERC) CIP-013 Implementation Guidance document suggests an entity could address R1.1’s requirement to “identify and assess cyber security risk(s) to the Bulk Electric System from vendor products or services” by means of a series of interactions with prospective vendors that comprise, for all intents and purposes, a risk assessment of the vendor, conducted by the entity. What recourse would a small entity have if a prospective supplier, perhaps the only one available, declined to cooperate with such an in-depth examination of its internal processes? R2, which requires the implementation of the entity’s R1 plan(s), acknowledges a vendor may be disinclined to agree to contractual obligations to support one or more specific elements of an entity’s R1 risk management plan. However, it contains no language that acknowledges this could make it difficult, if not impossible, for the entity to fully implement its R1 plan. N&ST believes this creates significant compliance risks for entities that may have few if any other options in some procurement situations. N&ST therefore recommends the addition of language similar to existing technical feasibility language in CIP-002 through CIP-011.

N&ST recommends that R2 be modified to state that a Responsible Entity has the option of describing its implementation of R1 Part 1.2.3 (revocation of vendor remote access privileges) in its CIP-004 Access Management and/or Access Revocation documentation.

N&ST recommends that R2 be modified to state that a Responsible Entity has the option of describing its implementation of R1 Part 1.2.6 (vendor remote access) in its CIP-005 ESP and Interactive Remote Access documentation.

N&ST recommends that R2 be modified to state that a Responsible Entity has the option of describing its implementation of R1 Part 1.2.5 (vendor software authenticity and integrity) in its CIP-010 Configuration Change Management documentation.

Initial CIP Senior Manager or delegate approval of risk management plan(s) should be added to R1. N&ST notes the initial implementation of R3 specified in the draft Implementation Plan is on or before the Effective Date. If that language is retained, there will be no need to add CIP Sr Manager or delegate approval to R1.

CIP-013 R2 and/or the Implementation Plan should contain “trigger” language for R2 that clarifies an entity must implement its R1 risk management plan(s) for new procurement contracts signed on or after the Effective Date of CIP-013. Entities with no new procurement contracts or no new in-progress procurements on the Effective Date should not be expected to be able to demonstrate compliance with R2 at that time.

NPPD supports the comments submitted by the MRO NSRF for CIP-013. In addition:

NPPD is concerned that this Standard is not sufficiently represented to be auditable. First, the Standard is not performance based, which leads to auditor discretion, which leads to inconsistency among the Regional Entities across the NERC footprint. Second, the Implementation Guidance document has words that protect the entities from interpretation risk, however are not part of the Standard; which leaves the auditor to determine the intent of the drafting team. This is true in the rationale section for R1 which has wording which would minimize interpretation risk to entities, however are not reflected in the Standard. The Rationale states that the supplier must meet CIP-013 unless it is either not offered by the supplier or would significantly increase the cost of the agreement. This needs to be included in the Standard or as a footnote in the Standard. This would be very important to clarity in audit practices. In addition, the Standard should specifically state that as long as evidence demonstrates that all items expressly identified in R1 are contained in the “plan” and are implemented via R2 that entities shall not be out of compliance (there should be no findings for opinion on intent or security).

As with other recently produced CIP Standards, this Standard is being “rushed” to satisfy a FERC directive and without concise and clear wording, implementation considerations of all impacted parties, and the means for auditors to audit to a performance based Standard and understood audit practices. An extended comment/balloting period should be requested of NERC/FERC in order to produce an auditable Standard.

Other comments:

There are no parameters for Standard applicability. If a piece of equipment is purchased and the vendor and entity meet the Standard, do subsequent purchases of associated parts relative to the equipment or replacement parts of the equipment from other vendors need to also meet the Standard?

R1 Parts 1.2.1 and 1.2.2 “vendor-identified incident” is not clear. This needs to have clarity added in the Standard. In addition “identified” should be changed to “confirmed”.

CIP-013 R1 parts 1.2.5 and 1.2.6 are covered in CIP-005 and CIP-010. CIP-013 parts 1.2.5 and 1.2.6 should be removed to avoid duplication. The revised CIP-013 parts 1.2.5 and 1.2.6 appear to apply to software source and identity verification (now required “when the method to do so is available” by CIP-010) and determining active vendor remote access sessions (now required by CIP-005). Having CIP-013 parts that require entities to perform the underlying function and to take those functions into account during the procurement process is needless duplication that does not increase security or reliability and could result in compliance “double jeopardy.”

Requirements 1.2 through 1.2.4. are extremely difficult to negotiate and implement with vendors, especially across such a diverse industry and diverse set of vendors. As written, the requirements make the vendor responsible for providing notifications to the Responsibility Entity. This puts the burden on the Responsible Entity to enforce these requirements through contractual obligations. The rationale states that "such contract enforcement is not subject to this Reliability Standard;" however, the performance of these requirements belongs solely to entities that are outside the jurisdiction of NERC and the Commission and can be held accountable only through contraction enforcement. As written, these specific reliability requirements put the Responsible Entities in a precarious position of acting as a surrogate regulator on a secondary industry.

If the intent is not to make the Responsible Entity accountable from a compliance stand point for the actions of vendors or other parties, the language should be written into the requirement wording. The clause in R2.2 states this exception, but does not then clarify what the Responsible Entity is obligated to do. The Responsible Entity is supposed to negotiate those terms, try to obtain that information, but if they can't then is it still not a violation? Will the auditors also look at it from this perspective?

Furthermore, the language of the R1.2 to R1.2.4 should be changed to meet the SDT's objectives while relying solely on the actions of the Responsible Entity and not those of any other party. However, if the intent is to include the items in R1.2 in the process for consideration of risk when selecting a vendor or product during the procurement process as the draft guidance seems to indicate, then those intentions should be explicit in the requirement language.

There is no issue with Requirement 3 requiring a periodic assessment of the supply chain cyber security risk management controls in order to update plans, etc. However, a recurring review by business unit stakeholders should be sufficient. The requirement to have the CIP Senior Manager or delegate approve the plan is simply a formality and is administrative in nature and provides no further security value.

SPP offers comments on the subrequirements of R1, as follows:

R1.1 – SPP recommends that subpart (i) be modified to accommodate the procurement “and/or” installation of vendor equipment “and/or” software and, further, requests clarification as to the intended meaning of the “transitions from one vendor(s) to another vendor(s)” concept within the context of subpart (ii).

1.2.1 – SPP recommends that “products or services” be modified to reference “products and/or services.”

1.2.2 – SPP requests clarification as to the “coordination” intended to be imposed, suggesting that the requirement may stand alone with any coordination component removed.

1.2.4 – SPP recommends that the 1.2.4 be modified to appropriately limit vendor disclosure of known vulnerabilities to the products and/or services provided to the Responsible Entity, consistent with 1.2.1. In addition, SPP notes that there is a lack of consistency between 1.2.1 and 1.2.4 with the use of the terms “vendor equipment” and “software” in 1.2.1, but uses the term “products” in subrequirement 1.2.4. SPP seeks clarification on whether the SDT intends “products” to be broader than equipment and software. SPP recommends that the SDT be consistent and use “vendor equipment” and “software” throughout, or provide additional clarification about the scope of the term “products.”

1.2.6- SPP requests clarification as to the “coordination” intended to be imposed, suggesting that the requirement may stand alone with the coordination component removed. SPP believes the “coordination of controls” may be interpreted as requiring the Responsible Entity and vendor to jointly develop and/or coordinate controls, rather than simply requiring the Responsible Entity to address the requisite remote access controls in its supply chain cyber security risk management plan(s). As drafted, SPP is concerned that it is unclear what is required for “coordination,” as well as how such coordination would be evidenced at audit.

Comment

NRG offers comments on the sub requirements of R1, as follows:

R1.1 – NRG recommends that subpart (i) be modified to accommodate the procurement “and/or” installation of vendor equipment “and/or” software and, further, requests clarification as to the intended meaning of the “transitions from one vendor(s) to another vendor(s)” concept within the context of subpart (ii).

1.2.1 – NRG recommends that “products or services” be modified to reference “products and/or services.”

1.2.2 – NRG requests clarification as to the “coordination” intended to be imposed, suggesting that the requirement may stand alone with any coordination component removed.

1.2.4 – NRG recommends that the 1.2.4 be modified to appropriately limit vendor disclosure of known vulnerabilities to the products and/or services provided to the Responsible Entity, consistent with 1.2.1. In addition, NRG notes that there is a lack of consistency between 1.2.1 and 1.2.4 with the use of the terms “vendor equipment” and “software” in 1.2.1, but uses the term “products” in sub requirement 1.2.4. NRG seeks clarification on whether the SDT intends “products” to be broader than equipment and software. NRG recommends that the SDT be consistent and use “vendor equipment” and “software” throughout, or provide additional clarification about the scope of the term “products.”

1.2.6- NRG requests clarification as to the “coordination” intended to be imposed, suggesting that the requirement may stand alone with the coordination component removed. NRG believes the “coordination of controls” may be interpreted as requiring the Responsible Entity and vendor to jointly develop and/or coordinate controls, rather than simply requiring the Responsible Entity to address the requisite remote access controls in its supply chain cyber security risk management plan(s). As drafted, NRG is concerned that it is unclear what is required for “coordination,” as well as how such coordination would be evidenced at audit.

Additionally: NRG is concerned that the R1 guidance provides details which are beyond the scope of R1.

NRG requests that the NERC SDT consider re-wording of R1 Part 1.2.1 and 1.2.4 to easily understand what is expected. These Parts appear to be duplicative. The Guidance does not adequately distinguish between the Parts. One interpretation is that Part 1.2.1 is for products/services and that Part 1.2.4 is for vulnerabilities in the product. It is not clear if these Parts expect information sharing at the time of procurement or on-going?

In R1 Parts 1.2.1 and 1.2.2, the term “vendor-identified incident” is unclear. It could mean incidents that were identified by another party, specific to the products of a specific vendor. It could mean only incidents identified by the vendor. Suggest changing “identified to “acknowledged” or “confirmed.”

Definition of vendor is not a NERC defined term. The term “vendor” is also used in the proposed CIP-005.

Request more guidance for the term “vendor” and use cases. Guidance should prompt Entities to include their definition of “vendor” in their plan(s).

NRG recommends removing those items (CIP-013 R1 subparts 1.2.5 and 1.2.6) that are covered in CIP-005 and CIP-010 from CIP-013. There are substantive requirements being incorporated into CIP standards to perform functions for all BES Cyber Systems (to the extent possible), it is not clear that there is a remaining need for a separate standard requiring that those items be addressed during the procurement process. This appears to apply to software source and identity verification (now required “when the method to do so is available” by CIP-010) and determining active vendor remote access sessions (now required by CIP-005). Having a standard that requires you to perform the underlying function and also to take those functions

into account during the procurement process is needless duplication that does not increase security or reliability and could result in compliance "double jeopardy."

NRG requests SDT consideration that: The Compliance and/or Implementation Guidance should make clear that, as long as evidence demonstrates that all items expressly identified in CIP-013, R1 are contained in a Supply Chain Cyber Security Management Plan or Plans, and are implemented pursuant to R2, entities will not be found out of compliance. More specifically, NRG requests NERC SDT consideration of the assertion that Registered Entities should not be subjected to CIP-013 noncompliance findings resulting from a difference of opinion concerning security adequacy.

CIP-013-1 R1.2 – "One or more process(es) used in procuring BES Cyber Systems that address the following, as applicable: " The term "as applicable" implies it is optional. Who determines whether something is applicable or not? NRG suggests that NERC SDT remove it or provide additional clarity.

CIP-013-1 R1.2.3, NRG has concerns that it is not clear when vendors have to notify if remote or onsite access should no longer be granted to vendor representatives. 2 hrs, 24 hrs, or 3 months?

Is there an expectation of the vendor to disclose non-public information in 1.2.4? Is this only during contracting or is there an expectation of new vulnerabilities to be disclosed?

1.1 – Delete "planning for". Or if the use of "planning for" in R1 creates a necessary distinction between 1.1 and 1.2, what is it?

- What is implied by *(ii) transitions from one vendor(s) to another vendor(s)*? Why is this distinction necessary? Wouldn't a vendor transition require a new contract? Does this refer to the act of severing existing remote access permissions? Subcontracting?

-

- R1.2.2: "Coordination of responses to vendor-identified incidents….", it is not clear who should be doing the coordinating and why this is necessary. NRG requests SDT consideration of suggestion to delete.

Furthermore, NRG requests NERC SDT consideration of the following comments:

· On page 6 of CIP-013 draft:

NRG requests that the NERC standard drafting team consider providing additional clarification to the following paragraph:

For example, entities can implement the plan by including applicable procurement items from their plan in Requests for Proposals (RFPs) and in negotiations with vendors. Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan. Although the expectation is that Responsible Entities would enforce the security-related provisions in the contract based on the terms and conditions of that contract, such contract enforcement and vendor performance or adherence to the negotiated contract is not subject to this Reliability Standard.

NRG requests that industry have the ability to accept a level of risk through internal risk assessment processes if a supplier is unwilling to negotiate and accept the cyber security terms into negotiated contracts.

· On page 6 of CIP-013 draft:

NRG requests that the NERC standard drafting team consider providing additional clarification to the following paragraph:

A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

NRG requests that the term vendor be further clarified to specify if meaning developers, product resellers or system integrators of “third-party” software, system components, or information system services, etc (versus internal company developers).

· On page 8 of CIP-013 draft (under R2):

NRG requests that the NERC standard drafting team consider providing additional clarification to the following paragraph:

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

NRG requests further understanding of what, if any expectations are to be included in T&Cs and what are the expectations of how the vendor will be expected to perform as the term “expectations” is listed on page 6 of the standard?

Comment

CIP-005 has had R2.4 and R2.5 added as they pertain to interactive user access and remote system to system access tracking. These were previously in the CIP-013 standard as part of the Supply Chain requirement. Due to CIP-005 R2 already dealing with an Intermediate system for Interactive Remote access, it seems logical that this requirement be expanded to include these.

The clarification that we don't have and would like from NERC/WECC is the intent of the following statement in CIP-013 R1.2.5 ***"Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System".*** There is no Guidelines and technical basis at the end of the standard for this

This has a very large implication as this says all software provided by a vendor has to perform an integrity and authenticity verification.

This could implicate a dedicated channel from the vendor validating through software certificates which would imply entities forcing software vendors to provide this mechanism, which the likelihood of meeting this for MS, Symantec, (non-control system software) is slim. MD5 checksums can not validate the integrity of the software as this hashing mechanism was broken in 2005 (although a lot of software vendors still use it).

So we need clarification on this before a vote recommendation can be established for CIP-013 R1.

Comment

PJM agrees, with the following suggested edits:

Within 1.2.1 and 1.2.2, PJM feels that "incident" need further clarification as it is a bit broad (i.e. could be interpreted as anything from a phishing attempt to an actual breach). PJM suggests it be narrowed down to actual breaches. Additionally, "security risk to the Responsible Entity" should be "security risk to the BES." Lastly, we like how the notification and coordination pieces are split out.

Within 1.2.3, PJM suggests changing "no longer be granted" to "should be revoked" to strengthen the language.

Within 1.2.5, PJM suggests adding in “firmware” and “where the method to do so is available” as to match the CIP-010 language.

The understanding of the intent and purpose of CIP-013 is very dependent on the Implementation Guidance document. There is no guarantee that this document will be approved by NERC even if CIP-013 is approved.

Request clarification on whether the SDT intends “products” to be broader than equipment and software. Recommend that the SDT be consistent and use “vendor equipment” and “software” throughout, or provide additional clarification about the scope of the term “products.”

There are concerns about language related to procurement contracts, in particular use of master agreements, piggyback agreements, and evergreen agreements. To address these concerns and position CIP-013 as a performance based Standard, we recommend that all references to “contracts” and most references to “procurement” be struck from CIP-013, except the note in R2 that states:

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

Our reasoning is that there are means other than vendor contract negotiations, contract language, and procurement processes to address and achieve the protections required by R1.2. It is immaterial how these protections are achieved. Focusing thinking and audit approach on contracts and procurement (even if specific contract terms are not in scope) limits flexibility, is unnecessarily prescriptive, and does not reflect performance-based principles. As such we ask that R1.2 be revised as follows:

1.2. *One or more process(es) used in procuring for its newly procured BES Cyber Systems that address the following elements, as applicable:*

(“new” meaning obtained after the implementation of CIP-013).

Request that the term “elements” be included in R1.2, as shown above, to clearly align with the VSLs for this requirement.

Associated guidance in the “Rationale for R1” and in the separate implementation guidance should be revised to reflect the change to a performance-based requirement in which contract terms and contract negotiations play no function in auditing. Contract terms might be used by an entity as evidence of performance, but there should be no expectation by audits or subtext in the Standard or implementation guidance that anything having to do with contracts or procurement processes is required. There should be no expectation of what might or should be included within Requests for Proposals, no expectation of when contracts might or should be renegotiated, no expectations of what terms might or should be included or requested, and no expectations of what terms might or should be found in a prudent and proper contract. Ultimately, there should be no expectation that such protections be achieved solely through the procurement process. The objective is achieving each protection, not in how it is achieved.

In the absence of such a change, we requests substantial additional clarification about how, without contract terms and contract negotiations being auditable, performance of R2 implementation will be audited and assessed.

AZPS agrees with the proposed requirements in CIP-013-1 subject to the below requests for clarification and recommended revisions/additions.

· AZPS requests that the SDT consider and provide guidance regarding the applicability of the requirements of CIP-013-1 where the traditional procurement process is not applicable to a particular purchase. For example, software that is purchased from a retail source rather than a vendor is often purchased subject to existing retail terms and conditions and without the opportunity to negotiate additional terms and conditions around the procurement.

· AZPS further recommends the following changes/additions:

· Requirement 1.2.4 - "Disclosure by vendors of known vulnerabilities ***when they become known to the vendor.***"

· Requirement 1.2.5 as written is duplicative with CIP-010; hence, AZPS recommends this Requirement be deleted or revised to address the process for software integrity and authenticity, rather than actual verification of those.

· Requirement 1.2.6 – AZPS recommends removal of the word "coordination" and on the insertion of the term "identification" to address a process for identifying how a vendor handles controls.

· Requirement R2 – evidence may not be available for items that are purchased form a retail source, as noted above. AZPS recommends an exception be identified for this purpose.

Modify R1.2.5 as follows: "Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System when technically feasible; and". This will help address concerns with vendors such as Microsoft that pushes patches when they identify a need.

Add language to address allowable exception in the event of CIP Exceptional Circumstances for R2 (e.g. patches issued with ransomware attack in-progress needed immediate action to be taken).

Luminant would prefer that the CIP-013 standard be formatted similar to other CIP standards with the use of tables (e.g.CIP-004-6 Table R1).

OPG request clarification, regarding R1.2.4, of whom the vulnerability must be known by to require disclosure and that it only be for the vendor's own products and only those supplied to the Responsible Entity. As stands, it might be interpreted that vulnerabilities might not need to be disclosed until publicly known, for products the Responsible Entity doesn't have, or for vulnerabilities the vendor might know in products other than its own. Suggest changing to "Disclosure by the vendor of vulnerabilities known to the vendor concerning products and services supplied by the vendor to the Responsible entity. Requirement R1 Part 1.2.4 requires additional clarification for the type of "known vulnerabilities" Vendor definition is required to avoid ambiguity; does the term vendor apply for contract employees/augmented staff/outsourcers? Are the requirements R1-R3 enforceable in exceptional circumstances?

With respect to the proposed Requirement 1 Part 1.2.1, compliance requires the vendor to be responsive to vendor-identified incidents. We can only be compliant if the vendor releases such information. We can’t be held responsible for a vendor that does not provide incident related information. This verbiage has to be deemed acceptable when developing the plan(s).

With respect to the proposed Requirement 1 Part 1.2.4, compliance requires the vendor to be responsive to disclosing vulnerabilities. We can only be compliant if the vendor releases such information. We can’t be held responsible for a vendor that does not disclose vulnerabilities. This verbiage has to be deemed acceptable when developing the plan(s).

With respect to the proposed Requirement 1 Part 1.2.5, compliance requires cooperation by the vendor to participate in such a program. We will give procurement preference to vendors willing to participate however we are still at relying on vendor cooperation. We can’t be held responsible for a

vendor that does not provide accurate verification of software integrity and authenticity. This verbiage has to be deemed acceptable when developing the plan(s).

We support the comments submitted by APPA, including the following recommendations:

Re-word R1, Parts 1.2.1 and 1.2.4 to better describe what is expected. The endorsed Guidance does not adequately distinguish between the two parts.

"Vendor" is not a NERC-defined term and contributes ambiguity.

Those items (CIP-013 R1, Parts 1.2.5 and 1.2.6) covered in CIP-005 adn CIP-010 should be removed from CIP-013 to avoid duplication.

The Compliance and/or Implementation Guidance should make clear that, when evidence demonstrates that all items expressly identified in CIP-013 R1 are contained in a Supply Chain Cyber Security Management Plan or Plans, and are implemented pursuant to R2, entities will not be found out of compliance.

There is concern about language related to procurement contracts, specifically the use of master agreements, piggyback agreements, and evergreen agreements. All references to "contracts" and most references to 'procurement" should be struck from CIP-013, except the note in R2.

: Platte River Power Authority (PRPA) continues to be a strong supporter of efforts to ensure the security of the Bulk Electric System and appreciates the time and effort that the SDT has put into considering industry feedback and incorporating it into the current drafts of CIP-005, CIP-010 and CIP-013.

PRPA agrees with limiting the requirement to high and medium assets only.

R1: PRPA generally agrees with the proposed Requirement 1 but is concerned about compliance obligations for procurement activities associated with multi-party wide-area contracts, master agreements and piggyback agreements. An exception, comparable to a CIP Exceptional Circumstance, should be included in the standard for these kinds of procurement activities.

PRPA recommends removing those items (CIP-013 R1 parts 1.2.5 and 1.2.6) covered in CIP-005 and CIP-010 from CIP-013 to avoid duplication. The revised CIP-013 parts 1.2.5 and 1.2.6 appear to apply to software source and identity verification (now required "when the method to do so is available" by CIP-010) and determining active vendor remote access sessions (now required by CIP-005). Having CIP-013 parts that require entities to perform the underlying function and to take those functions into account during the procurement process is needless duplication that does not increase security or reliability and could result in compliance "double jeopardy."

R2: PRPA agrees with the requirement to implement the supply chain cyber security risk management plan as outlined in Requirement 1.

R3: PRPA agrees that a 15-month review period is appropriate to review the supply chain cyber security risk management plan in Requirement 1.

Additionally, PRPA proposes that the regional entities voluntarily assess CIP-013 programs for entities who have audits in the period between standard approval and the effective date. This is similar to when the regional entities performed transition period audits of CIP v5 programs.

For Requirement R 1, Part 1.2.4, CenterPoint Energy Houston Electric, LLC ("CenterPoint Energy") recommends the following modification to help clarify the type of disclosed vulnerabilities:

"Disclosure by vendors of known security vulnerabilities involving the procured product or its supply chain that impact the availability or reliability of the Responsible Entity's BES Cyber System."

SMUD continues to be a strong supporter of efforts to ensure the security of the Bulk Electric System and appreciates the time and effort that the SDT has put into considering industry feedback and incorporating it into the current drafts of CIP-005, CIP-010 and CIP-013.

SMUD agrees with limiting the requirement to high and medium assets only.

R1: SMUD generally agrees with the proposed Requirement 1 but is concerned about compliance obligations for procurement activities associated with multi-party wide-area contracts, master agreements and piggyback agreements. An exception, comparable to a Technical Feasibility Exception (TFE) or Asset Capability Exception, should be included in the standard for these kinds of procurement activities. An additional consideration is to allow agreements between the vendor and entity that will not cause a financial impact, such as a letter of understanding, commitment to a plan of action or other agreement.

SMUD recommends removing those items (CIP-013 R1 parts 1.2.5 and 1.2.6) covered in CIP-005 and CIP-010 from CIP-013 to avoid duplication. The revised CIP-013 parts 1.2.5 and 1.2.6 appear to apply to software source and identity verification (now required “when the method to do so is available” by CIP-010) and determining active vendor remote access sessions (now required by CIP-005). Having CIP-013 parts that require entities to perform the underlying function and to take those functions into account during the procurement process is needless duplication that does not increase security or reliability and could result in compliance “double jeopardy.”

Austin Energy (AE) supports efforts to ensure the security of the Bulk Electric System and appreciates the time and effort the SDT put into considering industry feedback and incorporating it into the current drafts of CIP-005, CIP-010 and CIP-013.

AE agrees with limiting the requirement to high and medium assets.

R1: AE generally agrees with the proposed R1 but has concerns about compliance obligations for procurement activities associated with multi-party wide-area contracts, master agreements and "piggyback" agreements. NERC should include an exception, comparable to a CIP Exceptional Circumstance, for such procurement activities.

AE recommends removing those items (CIP-013 R1 parts 1.2.5 and 1.2.6) covered in CIP-005 and CIP-010 from CIP-013 to avoid duplication. The revised CIP-013 parts 1.2.5 and 1.2.6 appear to apply to software source and identity verification (now required “when the method to do so is available” by CIP-010) and determining active vendor remote access sessions (now required by CIP-005). Having CIP-013 parts which require entities to perform the underlying function and take those functions into account during the procurement process is needless duplication which does not increase security or reliability and could result in compliance “double jeopardy.”

R2: AE agrees with the requirement to implement the supply chain cyber security risk management plan as outlined in R1.

R3: AE agrees a 15-month review period is appropriate to review the supply chain cyber security risk management plan in R1.

Additionally, AE proposes the regional entities voluntarily assess CIP-013 programs for entities who have audits in the period between standard approval and the effective date, similar to when the regional entities performed transition period audits of CIP v5 programs.

Concerned that the R1 guidance provides details which are beyond the scope of R1 Definition of vendor is not a NERC defined term. The term “vendor” is also used in the proposed CIP-005. Request more guidance for the term “vendor” and use cases. Guidance should prompt Entities to include their definition of “vendor” in their plan(s). Request re-wording of R1 Part 1.2.1 and 1.2.4 to easily understand what is expected. In R1 Parts 1.2.1 and 1.2.2, the term “vendor-identified incident” is unclear. Request to merge R1 Part 1.2.1 and 1.2.2 for the notification and the coordination related to vendor-identified incidents. Request to merge R1 Part 1.2.3 and Part 1.2.6 for the notification and the coordination of controls when remote or on site access are required and granted for (i) vendor-initiated interactive remote access, and (ii) system-to-system remote access with a vendor(s). The Compliance and/or Implementation Guidance should make clear that, as long as evidence demonstrates that all items expressly identified in CIP-013, R1 are contained in a Supply Chain Cyber Security Management Plan or Plans, and are implemented pursuant to R2, entities will not be found out of compliance. More specifically, entities should not be subjected to CIP-013 noncompliance findings resulting from a difference of opinion concerning security adequacy.

While in overall agreement with Requirements 1 through 3, ACEC does have the following concern: The R1 and R2 requirements in the draft split the development of one or more documented supply chain cyber security risk management plan(s) (R1) and the implementation of those supply chain cyber security risk management plan(s) specified in Requirement R1 (R2). By splitting these the potential for violations have been increased from one (1) to two (2) – one for each requirement. It is recommended that R1 and R2 be combined to reduce the potential of multiple violations for what should be a single Requirement. To illustrate, a majority of the Standards have their development of plans, processes, or procedures and implementation of those plans, processes, or procedures in the same requirement: CIP-002-5.1 R1; CIP-003-6 R2, R4; CIP-004-6 R1, R2, R3, R4, R5; CIP-005-5 R1, R2; CIP-006-6 R1, R2, R3; CIP-007-6 R1, R2, R3, R4, R5; CIP-010-2 R1, R2, R3, R4; CIP-011-2 R1, R2

During the CIP-013-1 webinar on Feb 2, the SDT indicated several times that it is not the intention of R1 to force vendors to perform actions so that entities can comply with the standard. R1.2.1, R1.2.2, R1.2.3, R1.2.4 would force vendors to develop internal processes to notify entities of any changes relating to the requirements which would force vendors to take independent action to notify entities of any changes. Also, during the procurement phase, why would vendors reveal potential security flaws in their product above and beyond normal security patch notifications while they are competing against other vendors for the entities business? Also, entities have processes in place already for other CIP requirements to fully prepare an asset for deployment into the ESP. We don't grab equipment off of the back of the delivery truck and deploy it into the ESP immediately so what is the point of knowing about security flaws in their products during procurement? Any security flaws are probably already addressed with patches that will be downloaded and installed when preparing the asset for deployment. Also, a vulnerability assessment has to be performed against the asset and CIP-007/CIP-005 security controls have to be checked prior to deployment. 1.2.1, 1.2.2, 1.2.4, 1.2.5 appear to be redundant with CIP-007 R2 security patch management. Is the SDT expecting vendors to provide information about security/design flaws above and beyond the normal security patch notifications? If so, what kind of information would that be?

1.2.5 is troublesome as well (and it seems to be a duplicate of CIP-010-3 R1.6). Entities typically use update or proxy servers to discover and identify applicable security patches. For example, some use Windows Update Server Services to identify patches and roll them out once testing and approvals are complete. Do we need to check the check sums of the identified patches or can we trust that the update servers are authenticating the software?

Comment

There is a lack of consistency between R1 parts 1.2.1 and 1.2.4 with respect to the use of the terms. While part 1.2.1 uses the "vendor equipment" and "software," part 1.2.4 uses the term "products." The SDT should clarify if it intends "products" to be broader in scope than equipment and software. USI recommends that the SDT be consistent and use "vendor equipment" and "software" throughout, or provide additional clarification about the scope of the term "products."

In R1 parts 1.2.1 and 1.2.2, the term "vendor-identified incident" is unclear. It could mean incidents that were identified by another party, specific to the products of a specific vendor. It could mean only incidents identified by the vendor. USI suggests changing "identified to "acknowledged" or "confirmed."

Definition of vendor is not a NERC defined term. The term “vendor” is also used in the proposed CIP-005.

USI believes the SDT should provide guidance regarding the use of the term “vendor.” If “Vendor” is not defined by NERC, the Guidance should recommend that Entities include their definition of “vendor” in their plan(s).

Associated guidance in the “Rationale for R1” and in the separate implementation guidance should be revised to reflect the change to a performance-based requirement in which contract terms and contract negotiations play no function in auditing. Contract terms might be used by an entity as evidence of performance, but there should be no expectation by audits or subtext in the Standard or implementation guidance that anything having to do with contracts or procurement processes is required. There should be no expectation of what might or should be included within Requests for Proposals, no expectation of when contracts might or should be renegotiated, no expectations of what terms might or should be included or requested, and no expectations of what terms might or should be found in a prudent and proper contract. Ultimately there should be no expectation that such protections be achieved solely through the procurement process. Consistent with performance-based standards the objective is achieving each protection, not in how it is achieved.

Comment

ITC Holdings agrees with the proposed requirements, however, we believe the wording of CIP-013 leaves a lot of room for interpretation. We recommend being more prescriptive in the wording of CIP-013 as well as providing detailed guidance in the Technical Guidance document.

Additionally, ITC Holdings agrees with the below comment submitted by SPP regarding the use of “coordination”:

1.2.6- SPP requests clarification as to the “coordination” intended to be imposed, suggesting that the requirement may stand alone with the coordination component removed. SPP believes the “coordination of controls” may be interpreted as requiring the Responsible Entity and vendor to jointly develop and/or coordinate controls, rather than simply requiring the Responsible Entity to address the requisite remote access controls in its supply chain cyber security risk management plan(s). As drafted, SPP is concerned that it is unclear what is required for “coordination,” as well as how such coordination would be evidenced at audit.

Requirement R1. The IRC has no issues with the concept. We offer a recommendation on the language, “(i) Responsible Entity procures and installs vendor equipment and software; and (ii) Responsible Entity transitions from one vendor(s) product or service to another vendor(s) product or service”. Note: **ERCOT does not support the above comment.** Requirement 1.2.1. The current wording suggests that the vendor has sufficient knowledge of the Responsible Entities’ environment to know that a particular vulnerability does in fact pose a security risk to the Responsible Entity. We offer a recommendation on the language, *“Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that could pose cyber security risk to the Responsible Entity;”* Requirement 1.2.2. The current phrase “coordination of response” is not clear as to what is intended by “coordination”. We offer a recommendation on the language, *“Coordination of response activities by the vendor and the Responsible Entity to address vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;”* Requirement 1.2.4. The current wording is not clear as to which vulnerabilities are applicable. We offer a recommendation on the language, *“Disclosure by vendors of known vulnerabilities in the procured product or service following a responsible disclosure process”.”* Requirement 1.2.6. The use of the phrase “Coordination of controls” is confusing. We offer a recommendation on the language, *“Controls for; (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s).”*

2. The SDT developed proposed CIP-005-6 Requirement R2 Parts 2.4 and 2.5 to address the Order No. 829 directives for controls on vendor-initiated remote access to BES Cyber Systems covering both user-initiated and machine-to-machine vendor remote access. The SDT followed an approach recommended by stakeholders during the initial posting of CIP-013-1. Do you agree with proposed revisions in CIP-005-6? If you do not agree, or if you agree but have comments or suggestions, please provide your recommendation and explanation.

Elizabeth Axson - Electric Reliability Council of Texas, Inc. - 2

Answer	No
Document Name	

Comment

ERCOT joins the comments of the IRC and offers the following additional comments:

Regarding Part 2.4, ERCOT is concerned that the meaning of "determining" in the phrase "have one or more methods for determining active vendor remote access sessions" is unclear. If the SDT's intent is to require *identification* of instances of active vendor remote access, ERCOT suggests rewording to "have one or more methods of *identifying instances of* active vendor remote access (including Interactive Remote Access and system-to-system remote access)."

ERCOT also requests clarification on the meaning of "system-to-system remote access." Interpreted broadly, this requirement could mean all ingress/egress network connections to the security zone. Identifying each instance of connection could become extremely burdensome, without providing any meaningful reliability benefit.

ERCOT recommends that the meaning of system-to-system remote access be qualified as vendor remote access which can do harm to the BES Cyber System (BCS) and recommends the following language:

"Have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access). This is limited to sessions which have the ability to harm the BCS."

If the SDT declines to adopt this language, the SDT should consider defining "system-to-system remote access" or further clarifying the meaning of this term in the "Guideline and Technical Basis" section or in the Implementation Guidance.

Comments: The definition of vendor is crucial to an entity defining and carrying out its compliance objectives for the requirements in question. Definition of vendor is not a NERC defined term. The term “vendor” is also used in the proposed CIP-013. Request more guidance for the term “vendor” and use cases. Guidance should prompt Entities to include their definition of “vendor” in their plan(s). Guideline & Technical Basis for R2 should be included in this update. Supplemental materials may be out of date – see page 21 of 24 in the posted redline version. Include reference to FERC Order 829 for Parts 2.4 and 2.5 Consider adding a CIP Exceptional Circumstance clause to R2 Parts 2.4 and 2.5

Duke Energy requests additional clarity pertaining to the use of the term “active” in Requirement 2 Parts 2.4 and 2.5. As written, it could be interpreted that an entity would be required to monitor the remote access sessions of a vendor in real-time. Was this the drafting team’s intent with this language? If the drafting team’s intent was that an entity only be able to identify which vendor’s have remote access, we suggest revising the standard to more closely reflect said intent. If it is the drafting team’s intent that an entity must monitor in real-time the remote access of a vendor, additional guidance as to acceptable methods to achieve compliance with this intent is necessary.

Comment	
CIP-005-6 R2 Part 2.4 as drafted does not identify the “direction” of how system-to-system remote access is initiated. Interactive Remote Access specifies that it originates “from a Cyber Asset that is not an Intermediate System and not located within any of the Responsible Entity’s Electronic Security Perimeters”. Without defining the system of origin or other defining controls, similar to the definition of Interactive Remote Access, any connection from a CIP Cyber Asset to a vendor system, even if one-way and simply for data acquisition/submission, could be interpreted as subject to this requirement. Additional clarification is requested. Additionally, the Supplemental Material for the requirement points to a separate document without an official link. It appears this document has not been updated in six (6) years, and mostly targets securing Interactive Remote Access. It is requested that updated relevant material be placed in the Standard’s Supplemental Material section, similar to other CIP standards, and that the Supplemental Material section also attempt to provide guidance on the securing of system-to-system remote access.

I fully support the concept of monitoring and being able to terminate all remote acccess sessions, however as written the additional requirements have no timing aspects associated with them, have no component for notification or alerting on active sessions, are atrifically limited to vendor access only, (lower case vendor) so may not include contractors, service providers, etc. Cannot support the requirement as written.

With the deletion of the language in R2, it now appears that every Responsible Entity needs to have a documented process for Interactive Remote Access, even if the Responsible Entity does not allow it. Why did the team delete this exemption language from R2 as it seemed to lessen the burden for those entities that do not allow Interactive Remote Access?

R2 part 2.4 should read: Have one or more methods for determining when vendor Interactive Remote Access and/or vendor system-to-system remote access sessions are active.	

Part 2.5 should read: Have one or more methods to disable active vendor Interactive Remote Access and/or vendor system-to-system remote access sessions).

Comment

The inclusion of (including Interactive Remote Access and system-to-system remote access) is problematic as the NERC defined term of Interactive Remote Access (IRA) explicitly excludes system-to-system process communication. Additionally, IRA already includes the concept of vendors (see 3) below).

"User-initiated access by a person employing a remote access client or other remote access technology using a routable protocol. Remote access originates from a Cyber Asset that is not an Intermediate System and not located within any of the Responsible Entity's Electronic Security Perimeter(s) or at a defined Electronic Access Point (EAP). Remote access may be initiated from: 1) Cyber Assets used or owned by the Responsible Entity, 2) Cyber Assets used or owned by employees, and 3) Cyber Assets used or owned by vendors, contractors, or consultants. Interactive remote access does not include system-to-system process communications."

The SDT should consider removing this system-to-system exclusion from the IRA defined term and stating Part 2.4 as –

Have one or more methods for determining active vendor Interactive Remote Access sessions.

And Part 2.5 as –

Have one or more method(s) to disable active vendor Interactive Remote Access sessions.

(note: the addition of 'sessions' in this Part to be consistent with Part 2.4.)

Lastly, from an SCRM perspective, the SDT should consider at least including some indication of when vendor remote access could or should be disrupted, but that may be better addressed in the CIP-013-1 R1.2.2 and/or R1.2.6 processes of the SCRM plan(s).

There needs to be a clear explanation of “machine-to-machine” and “system-to-system” remote access in the Guidelines & Technical Basis to provide the necessary understanding and scoping of these concepts for industry.

For example – “Machine-to-machine” or “system-to-system” remote access would include a logical connection between a High or Medium Impact BES Cyber System or it’s associated PCAs into or out of the associated ESP with a vendor-maintained Cyber Asset, and that connection does not have an interactive user access capability.

Additionally, under the Measures of R2.4, the statement of examples needs to have “such as” following “(including Interactive Remote Access and system-to-system remote access), such as:” to make it clearer that the below bulleted items are options an entity may choose from, and to be consistent with the formatting of R2.5.

The IRC agree with the new CIP-005-6 Requirement R2 Parts 2.4 and 2.5 however we note there is no corresponding “Guidance and Technical Basis” or “Rationale”. We also suggest that guidance be drafted to help entities understand what is intended by the term “Vendor” in relation to parts 2.4 and 2.5.

Regarding Part 2.4, the IRC is concerned that the meaning of “determining” in the phrase “have one or more methods for determining active vendor remote access sessions” is unclear. If the SDT’s intent is to require *identification* of instances of active vendor remote access, the IRC suggests rewording to “have one or more methods of *identifying instances of* active vendor remote access (including Interactive Remote Access and system-to-system remote access).”

Texas RE agrees with the proposed requirements and has the following comments.

- Question 2 above uses the term "*machine-to-machine vendor remote access*". CIP-013-1 and CIP-005-6 use the term ""system-to-system remote access". Since these are two different terms, Texas RE recommends these terms be defined or examples provided to increase clarity and to avoid multiple interpretations.
- Section 4.2.3.5 – The language, "*Each Responsible Entity shall implement develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber Systems*." is redundant with the requirement language. Also, neither CIP-013-1 nor CIP-010-3 contain this language in the Exemptions section.
- Page 1 Section 4.1.2.2 and Page 2 Section 4.2.1.2: Texas RE noted the term "*Special Protection System"* was removed. Texas RE recommends removing this term in all CIP standards.

The requirement in CIP-005-5 6 Table R2.4 states that an entity must have one or more processes to determine active vendor session. We would recommend adding ‘Active and Passive’ to the requirement since the Measures point to passive initiation in having the vendor call or receive permission before their remote access is granted. Additional guidance on what is ‘Active’ and whether the monitoring session requires tracking the entire session or initiation of the session would provide more clarity to industry.

Comment

OPG suggest the term “vendor” be defined to exclude outsourcers that manage most aspects of a BES Cyber System. Normally they are contractually obligated to act in the Responsible Entities interests and fulfill or accommodate all compliance requirements. As such, this is a much closer relationship than is typically associated with the term “vendor”. Because in many such cases they would be principle maintainer or operator of said systems would often not technically feasible to disable the outsourcer’s access, remote or otherwise.

Requirement 2.4 mentions ability to determine “sessions”, not just “access”. Requirement 2.5 is ambiguous on whether it requires the ability to disable “active sessions” as opposed to merely disabling “active accounts”. Suggest replacing “access” in R2.5 with either “sessions” or “accounts” depending on what was intended or otherwise elaborating.

AZPS agrees with the inclusion of Parts 2.4 and 2.5 within CIP-005-6 R2; however, requests the statement “active vendor remote access sessions” be changed to “active vendor remote connection.” A vendor may sustain an active remote connection for longer than an individual active remote access session. Thus, a revision to the language would clarify the intent of this requirement, which is to monitor any time a vendor is connecting to and accessing sensitive cyber assets remotely. Thus, AZPS encourages the SDT to consider this revision as it will better ensure that active remote connections by vendors are monitored and addressed.

As stated, this requirement seems to start with the base assumption that the Registered Entity allows vendors to have Remote Access to the Registered Entity’s BES Cyber Assets with External Routable Connectivity (ERC), and therefore must implement a method to detect active vendor remote access session and have a method for disabling vendor access. Many Registered Entities do not allow vendors to have Remote Access to substation medium BES Cyber Assets. Would this relieve such REs from having to then develop a method to detect and disable active vendor remote access session and would documentation demonstrating that Vendor Remote Access was not allowed be sufficient?

The definition of “vendor” is important for defining and carrying out its compliance objectives for the requirements parts 2.4 and 2.5. The drafting team should add a part of one or both requirements to include a specific definition of vendor to support the related compliance procedures and evidence required of an entity.

For Part 2.4, it is not clear if the requirement applies to contractors and service vendors that are provided authorized access under CIP-004. Additionally, more information is needed on the meaning of “active”. Most of this is captured in logs after the fact. Does the drafting team intend for “active” to imply real-time information? Please clarify if the requirement only applies to a connection from the vendor directly to a system within the ESP or does it apply to connections from a vendor to a system outside the ESP that updates one inside the ESP.

For Part 2.5, Oncor would like clarification of the action, or examples, for when access should be disabled.

A definition of “vendor” is necessary. This should be interpreted as any third-party that initiates a remote access session. Not every third-party is necessarily considered a “vendor” based on generally accepted definitions.

With respect to the proposed Requirement 2 Part 2.4, additional details need to be provided on the expectations of “determining active vendor remote access sessions”. Two of the proposed measures state, “Methods for monitoring activity (e.g. connection tables or rule hit counters in a firewall, or user activity monitoring) or open ports (e.g. netstat or related commands to display currently active ports) to determine active system to system remote access sessions; **or** Methods that control vendor initiation of remote access such as vendors calling and requesting a second factor in order to initiate remote access.” The former will be difficult to actively monitor for remote access. Remote access can be monitored, but this activity is too resource intensive to monitor in real-time. If it is necessary to actively monitor remote access in real-time then additional guidance is necessary. The latter is easily implemented. It is uncertain whether this requirement is expecting constant monitoring during the remote access session or just controlling access and logging the access. A more detailed expectation on the use of the reference tools is necessary.

We request clarification on whether “system-to-system” access applies to access that is “one-way” where the remote end conducts only monitoring activity and no control is possible, or whether the SDT intent is that any system-to-system access be included. We would suggest that the SDT add verbiage to the Guidelines and Technical Basis making the distinction for each type of “active vendor remote access sessions” that are included in this requirement (Interactive Remote Access, system-to-system remote access with control, and/or system-to-system remote access for monitoring only). Another suggestion would be to create a formal NERC definition of system-to-system access.

The NSRF question the use of "…*active* vendor…" in part 2.4 and 2.5 Requirements. The word "active" could mean either "the vendor is currently allowed electronic access and is currently within a BES Cyber Asset" OR "the vendor is idle and but has electronic access to a BES Cyber Asset". The NSRF recommends that "active" be removed as this will provide clarity to applicable entities. If active sessions was the SDT thought process, please state that within the proposed part.

3. The SDT developed proposed CIP-010-3 Requirement R1 Part 1.6 to address the Order No. 829 directive for entities to address verification of software integrity and authenticity in the BES Cyber System environment (P 48). The SDT followed an approach recommended by stakeholders during the initial posting of CIP-013-1. Do you agree with proposed revisions in CIP-010-3? If you do not agree, or if you agree but have comments or suggestions for the proposed requirement, please provide your recommendation and explanation.

Colby Bellville - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy

Answer	No
Document Name	

Comment

Duke Energy requests additional guidance as to what constitutes acceptable verification of integrity as required by R1.6.2. The measure indicates that a change request record could demonstrate that source identity and integrity verification took place, but doesn't go into further detail as to what an acceptable check into source identity and software would be. Is there specific language that should be stated in the change request record that would clearly state the verification took place? More guidance on this aspect is requested.

Also, Duke Energy requests that the Note under Applicable Systems in Part 1.6 should remain there once the standard is approved. The Note provides valuable details as to the true scope of the Requirement, and aids entities in knowing what will be the compliance expectation.

Comments: The proposed requirement would possibly involve entities duplicating effort for every case for which such verification had to be undertaken (i.e. the cases of multiple installations of a given piece of software across many similar applicable Cyber Assets). This does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection. Request guidance on using trusted internal repositories as a software source so that Entity can verify once and use many VSL does not cover the failure to implement the process. Does not include all of the combinations. Concerns with 1.6.1 and 1.6.2 as written --- how to provide evidence? Request more examples of evidence We suggest rephrasing “when the method to do so is available to the Responsible Entity from the software source” to “when the vendor supplied method to do so is available to Responsible Entity”. Otherwise the “method to do so” is ambiguous and leaves the following questions: How does one prove that a method is not available? What is the line between available/unavailable? How far do you have to go? We are concerned with double jeopardy potential with CIP-007 R2. We feel that if it is impossible to validate the source or verify authenticity of the patch itself we would not consider that patch to be available.

To avoid an interpretation of this requirement that may be overly burdensome, ERCOT suggests the following clarifications to the language in the requirement and measure of CIP-010-3 R1 Part 1.6. This would ensure a more holistic and less prescriptive approach to changes that deviate from the baseline. In the first sentence of Requirement R1.6, revise “For a change that deviates” to “Where technically feasible, for changes that deviate…” Revise the R1.6 Measure to read “An example of evidence may include, but is not limited to, a change request record that demonstrates the verification of identity of the software source and integrity of the software was performed during the baseline change*, or a process which documents the mechanisms in place that would automatically ensure the authenticity and integrity of the software.”*

Comment

Need clarification about how the addition of R1.6 applies only to BES Cyber Systems that are newly implemented and thus did not previously have a baseline and as such do not have an existing baseline to deviate from. Please clarify that this is for new BES Cyber Systems to avoid confusion and challenges during an aduit.

Need some additional examples of what constitutes evidence to meet compliance to this standard. Some systems are not connected to the internet purposefully and as such patches are installed utilizing a CD/DVD provided by the vendor. What would constitute appropriate evidence for a case such as this?

This requirement is not clear whether an entity has to duplicate efforts for every case for which such verification has to be undertaken (i.e. the cases of multiple installations of a given piece of software across many similar applicable Cyber Assets). This does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection. Request guidance on using trusted internal repositories as a software source so that an entity can verify once and apply to many assets.

Response

Thomas Foltz - AEP - 5	
Answer	No
Document Name	

Comment

Since the intent of CIP-010-3 R1.6 is a proactive verification of software integrity, R1.6 should focus on a single verification prior to introducing vendor software into the production environment. The current language of R1.6 utilizes a retroactive focus via baseline deviations. Please see the suggested wording - “Prior to introducing software not resident in baseline items (per 1.1.1, 1.1.2, and 1.1.5), and when the method to do so is available to the Responsible Entity from the software source:

1.6.1. Verify the identity of the software source; and

1.6.2. Verify the integrity of the software obtained from the software source.”

Response

Michael Haff - Seminole Electric Cooperative, Inc. - 1,3,4,5,6 - FRCC	
Answer	No
Document Name	

Comment

Proposed Requirement R1 Part 1.6 appears to require verification of identity and integrity of applicable changes to the baseline. However, the measure for this requirement gives an example of having a process, e.g., a change request record, instead of a specific example of verification. Can the team clarify the measure for this Requirement as an entity can have a change ticket process that merely requires the user to click a button that states that the software has been verified, however, if the team believes proof of such check, such as a screenshot of the vendor site, is required, please state such as an example.

Additionally, the example of evidence does not demonstrate how a software source or the software integrity is verified. An internal change ticket is not a verification of the software source. If they are going to push for source verification then modify CIP-007 R2.1 to include it. Specifically, what is expected as evidence -- a hash, screenshot, attestation, digital signature?

Anthony Jablonski - ReliabilityFirst - 10	
Answer	No
Document Name	

Comment

Even though ReliabilityFirst believes the changes to CIP-010-3 draft standard address directives from Federal Energy Regulatory Commission (FERC) Order No. 829 and is a positive step in addressing cyber supply chain management, ReliabilityFirst Abstains mainly due to Requirement R1 missing Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS), and Protected Cyber Assets (PCAs). ReliabilityFirst offers the following specific comments for consideration.

1. Requirement R1 Part 1.6
2.
    i. ReliabilityFirst believes the “Applicable Systems” under Requirement R1 Part 1.6 should be consistent with “Applicable Systems” under parts 1.1, since sub-parts (Part 1.1.1, 1.1.2, & 1.1.5) are called out under the “Requirements” section for Part 1.6. EACMs and PACS are critical cyber assets that control access and monitoring into the entities’ ESPs and PSPs and should follow the Supply Chain standard/requirements as do the High and Medium Impact Cyber Systems. As for the PCAs, if they are compromised due to a vulnerability in the vendors supplied hardware or software, they can possibly affect high and medium impact BES Cyber Systems. ReliabilityFirst offers the following modifications for consideration for the “Applicable Systems” column in Requirement R1 Part 1.6:
        a. High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA
        b. Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA

3. Requirement R1 Part 1.6.3 (new sub-part)

    i. ReliabilityFirst believes a new sub-part 1.6.3 should be added to address the verification of the baseline configuration. ReliabilityFirst offers the following new sub-part 1.6.3 for consideration:

        a. Verify the deviations from the baseline configuration.

Comment

Ther is nothing wrong with the concept of the requiment however the language of the requirement is not supportable. The term available could me technically available, procedurally available, contracturaly available, freely available (no support purchase required). As written this requirement by its nature will be implemented and assessed drastically differently by different Responsible Entities. One could argue that only if all the available methods listed above exist in unison is software actually available.

Response

Tho Tran - Oncor Electric Delivery - 1 - Texas RE

Answer	No
Document Name	

Comment

There are auditing challenges around the phrase “when the method to do so is available to the Responsible Entity from the software source” as it is hard to prove a negative. Oncor believes that verification of software source and integrity can take many forms. To take into consideration legacy software, Oncor believes the wording should be adjusted, to reflect FERC intentions that the requirements are forward looking, by replacing the phrase *“and when the method to do so is available to the Responsible Entity from the software source”* with *“and, at a minimum, for the portion of the software that has changed:”*

Second, the proposed requirement would possibly involve entities duplicating effort for every case for which such verification had to be undertaken (i.e. the cases of multiple installations of a given piece of software across many similar applicable Cyber Assets). We offer a recommendation on the language, *“Document and implement a software source management process to address source identity verification and media integrity controls on the software repository used for changes that deviate from the existing baseline configuration associated with items in parts 1.1.1, 1.1.2, and 1.1.5.”*

This process must include steps:

• To verify the identity of the software source when the method to do so is available; and

• To verify the integrity of the software obtained when the method to do so is available.

Evidence may include verification of identity of the software source and integrity of the software was performed for repository updates.”

Response

Don Schmit - Nebraska Public Power District - 5

Answer	No
Document Name	

Comment

NPPD supports the comments of the MRO NSRF, in addition:

Auditors will have too much discretion as to what is or is not enough for a validation check of each vendor, which will lead to inconsistencies across the NERC RE footprint. It is up to entities to document what the vendor is willing to do and hope the auditors agree it is enough to continue doing business with the vendor. Also, the language of the requirement says “…when the method to do so is available…”. If a vendor does not have a method to do so, but does in the next year or so, the entity may have a possible violation if it did not realize there was a change in the vendor’s available methods. This would force entities to periodically check to see if the vendor capabilities have changed. What is the period that would not make this a violation? The requirement is very vague.

To ensure that resources are appropriately focused on changes to be applied, AZPS recommends clarifying that verification should be completed “prior to application of a change.” Such a clarification will signal to entities that verification only needs to be performed where a change will be applied and avoid circumstances where a change is being evaluated for application and verification occurs, but the change is not applied. Under the current obligation, it is likely that verifications and associated evidence would be prepared regardless of whether the change is or is not applied and would therefore result in the dedication of resources to efforts that would have no benefit to reliability or security.

Additionally, AZPS requests clarification regarding the continued need for verification evidence where such is not available from the vendor. Specifically, AZPS notes that, where a vendor’s policy does not provide the necessary evidence associated with verification, this Requirement may frequently represent null evidence for areas where items are reviewed each time a change occurs, but no data is available due to the vendor’s policies. Such efforts would be redundant and of little or no value to security and reliability.

By adding the “when the method to do so is available to the Entity from the software source” does this require the entity to document and detail what method is available of not available? How does that entity prove and document this condition? Does the entity have to document and prove that it was tested and verified for software integrity and authenticity? If so, what are those requirements, documentation, testing environment required and timeline for testing the software?

AECI supports NRECA's comments provided below: NRECA supports the revisions to CIP-010-2. However, in the GTB the SDT should clarify the meaning of this sentence: “For example, in the System and Information Integrity (SI) control family, control SI-7 suggests that the integrity of information systems and obtaining software directly from the developer.” This sentence seems to be incomplete and further words are needed to complete it.

EPE understands the need for software integrity and authenticity; however, the proposed wording of the standard is not sufficiently clear with respect to the action/conduct being sought by the Registered Entity in order to achieve compliance. In Order No. 829, FERC offered clarity that the proposed requirement does not capture. There, FERC stated: For example, in the System and Information Integrity (SI) control family, control SI-7 suggests that the integrity of information systems and components should be tested and verified using controls such as digital signatures and obtaining software directly from the developer. In the Configuration Management (CM) control family, control CM-5(3) requires that the information system prevent the installation of firmware or software without **verification that the component has been digitally signed** to ensure that hardware and software components are genuine and valid. NIST SP-800-161, while not meant to be definitive, provides **examples of controls for addressing the Commission’s directive regarding this first objective. Other security controls also could meet this objective.** Order No 829 at P 50 (emphasis added). Requirement 1.6 should be adjusted to provide the type of clarity FERC provided in the Order. An additional sentence or parenthetical should be included within the requirement, to read (“Verification that a patch or other software component has been digitally signed is one way to meet this requirement; other security controls could also meet this requirement, such as having the vendor state in writing that it will verify the integrity and

authenticity of all software, including patches, in advance of releasing it to the Registered Entity during the life of its service contract with the Registered Entity").

The addition of such language *in the requirement itself* is consistent with the feedback offered by NERC Staff in recent months, and would eliminate the false impression that would otherwise be given that a Registered Entity must secure a verification letter from its software vendor each and every single time it seeks to download a patch. For example, during the NERC webinar held on May 18, 2017, examples were provided to the attendees on information that would be considered sufficient evidence to fulfill this requirement, and such examples included a letter from the vendor indicating that the vendor is verifying integrity and authenticity of its software before releasing its software (including patches) to its clients.

Additional examples of acceptable evidence would be helpful under the Measures column of the requirement.

Change the statement in the Guidelines and Technical Basis, Section Software Integrity and Authenticity, paragraph 1, third sentence: “The intent of the SDT is to provide controls for verifying the baseline elements that are *updated* by vendors.” to say “… *provided* by vendors.”

Additional clarity is needed regarding the following in the Guidelines and Technical Basis: “It is not the intent of the SDT to require a verification of each source *or software update at the time it is obtained*. It is sufficient to *establish the reliable source and software update once*. This will allow automated solutions to be implemented to obtain frequent updates such as patches.” This is confusing because saying “each source or software update” is not required to be validated at the time it is obtained could be interpreted to mean continuous patch updates provided by a single vendor are only required to be verified once for the lifetime of the supply of patches from that vendor.

Additional examples of acceptable methods and evidence are needed in the Guidelines and Technical Basis for performing software integrity and authenticity.

For example – Consider having the measures for R1.6 be similar to R1.1.

We request clarification on the timing of requirement 1.6; specifically, on whether 1.6 must be completed before being placed in operation on a BES Cyber System. This distinction was made in the previous draft ("one or more documented process(es) for verifying the integrity and authenticity of the following software and firmware before being placed in operation on high and medium impact BES Cyber Systems"). Under the current language, it appears sub-requirement 1.6 could be done before or after the software is placed on a BES Cyber System. We suggest the SDT add a timeframe similar to the other CIP-010 R1 sub-requirements. For example, 1.3 states "within 30 days" while 1.4.1 states "prior to the change". Additionally, we request adding 1.1.3 (any custom software installed) to 1.6, as custom software could be internally or externally provided, and needs to be verified for integrity and authenticity.

Need to emphasize the phrase “and when the method to do so is available to the Responsible Entity for the software source”. Since this is a non-prescriptive requirement it is expected that we will be demonstrating compliance by implementing the plan(s) required in CIP-013. Since it may not be possible to hold the software resource directly responsible it is expected that the demonstration of “best effort” will be sufficient and not subject to interpretation by the Compliance Enforcement Authority. Recommend providing more examples of suitable evidence that should be gathered to verify identity and integrity. The Measure as currently written is too vague.

PRPA agrees this requirement belongs in CIP-010 R1. PRPA generally agrees with Proposed R1 Part 1.6, but request the following items be addressed by the SDT:

- PRPA recommends the Guidelines and Technical Basis section is updated to reflect current information.
    - The requirement states “For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5…,” indicating the authenticity and integrity of the specified parts need to be verified each time there is a change to a baseline for those parts. The proposed requirement would possibly involve entities duplicating effort for every case for which such verification had to be undertaken (i.e., in the cases of multiple installations of software across many applicable Cyber Assets). This does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection. We believe that the existing statement in the GTB provides clarity on this issue and request that it not be removed. From the GTB: “It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches.”
    - PRPA also recommends the language of the requirement be re-worded to reflect the intent of the GTB, as an auditor audits to the requirement, not the GTB. Doing a verification of authenticity and integrity for each change to the baseline for the specified parts would be tedious and require entities to acquire additional resources to perform the work.
- There is no guidance on how to verify the identity (authenticity). Performing this verification could be difficult if the software/patch comes from a third party tool. Guidance on how this can be done needs to be made available to entities in order to perform an evaluation of the work and resources involved to achieve this requirement. Hashing was given as an example during an industry webinar, but this is not realistic for each type of system.
- Additional examples of acceptable measures should to be listed. Additionally, PRPA requests examples of acceptable evidence when there is not a method available to verify the identity of the software source.
- While PRPA supports these changes, clarification is required about how new R1.6 applies to entirely new BES Cyber Systems (BCS), i.e., BCS that are newly implemented, have not previously had a baseline, and thus do not have an existing baseline for a change to deviate from. We expect that R1.6 is intended to apply to new BCS as well as to existing BCS, but as written the requirement does not. Please clarify to avoid implementation confusion and audit challenges.

The Guidelines and Technical Basis of CIP-010-3 states: “It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches.”

CenterPoint Energy recommends incorporating this concept in the R2 requirement language in order to clarify that integrity and authenticity do not need to be verified for every source or software update, and that the download once and install on many approach is acceptable if the integrity and authenticity of the downloaded software are validated. CenterPoint Energy recommends adding the following language to Requirement R2:

Upon validation of the integrity and authenticity of software, a Responsible Entity does not need to verify the integrity and authenticity for subsequent updates of such software.

AE agrees this requirement belongs in CIP-010 R1 and generally agrees with Proposed R1 Part 1.6, but request the SDT address the following items:

AE recommends the Guidelines and Technical Basis section be updated to reflect current information.

The requirement states “For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5…,” indicating the authenticity and integrity of the specified parts must be verified each time a baseline changes for those parts. The proposed requirement would possibly involve entities duplicating effort for every case for which such verification had to occur (e.g., in the cases of multiple installations of software across many applicable Cyber Assets). This requirement does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection. We believe the existing statement in the GTB provides clarity on this issue and request it not be removed. From the GTB: “It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches.”

o AE also recommends rewording the language of the requirement be re-worded to reflect the intent of the GTB, as an auditor audits to the requirement, not the GTB. Doing a verification of authenticity and integrity for each change to the baseline for the specified parts would be tedious and require entities to acquire additional resources to perform the work.

o There is no guidance on how to verify the identity (authenticity). Performing this verification could be difficult if the software/patch comes from a third party tool. Guidance on how this can be done needs to be made available in order to perform an evaluation of the work and resources involved to achieve this requirement. Hashing was given as an example during an industry webinar, but this is not realistic for each type of system.

o Additional examples of acceptable measures should to be listed. Additionally, AE requests examples of acceptable evidence when there is no method available to verify the identity of the software source.

While AE supports these changes, clarification is required about how R1.6 applies to entirely new BES Cyber Systems (BCS), i.e., BCS newly implemented and which have no previous baseline, and thus do not have an existing baseline from which a change can occur. We expect R1.6 is intended to apply to new BCS as well as to existing BCS but, as written, the requirement does not. Please clarify to avoid implementation confusion and audit challenges.

Request to defined the scope of the requirements “for new contracts only”

With no defined scope, if the standard become effective in same time of the standard CIP-013-1, no terms will existed beetween entities and vendor for effective contracts. How the entities will be conformed to requirements ?

The proposed requirement would possibly involve entities duplicating effort for every case for which such verification had to be undertaken (i.e. the cases of multiple installations of a given piece of software across many similar applicable Cyber Assets). This does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection.

VSL does not cover the failure to implement the process. Does not include all of the combinations.

Concerns with 1.6.1 and 1.6.2 as written --- how to provide evidence? Request more examples of evidence.

The NSRF has the same comment from CIP-013-1 R1: CIP-010-3 R1.6 is troublesome as well. Entities typically use update or proxy servers to discover and identify applicable security patches. For example, we use Windows Update Server Services to identify patches and roll them out once testing and approvals are complete. Do we need to check the check sums of the identified patches or can we trust that the update servers are authenticating the software?

R1.6 brings to mind several challenges. The intent appears to be to ensure that software is validated, which is not the issue. The issue is the auditability of the requirement and its existing language. The wording “when the method to do so is available” puts additional obligations on the Responsible Entity to prove whether the methods were available or not, when the methods were available, if it was appropriate to utilize the available methods in a given circumstance. It adds additional nuance when the methods are often obtained from third parties. If it is a legacy contract and has not been updated and the method is available to other entities but not to the Responsible Entity due to the legacy contract, is the method considered available? The intent of this requirement is good but the auditability of the language is challenging at best and should be adjusted to consider how entities will be able to document and comply with the requirement language.

NRG recommends that the drafting team provide examples to provide clarity on control design to meet the intent of the standard.

The proposed requirement would possibly involve entities duplicating effort for every case for which such verification had to be undertaken (i.e. the cases of multiple installations of a given piece of software across many similar applicable Cyber Assets). This does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection. NRG requests guidance on using trusted internal repositories as a software source so that Entity can verify once and use many

The VSL as currently written may not cover the failure to implement the process. The VSL may not include all of the combinations.

NRG has concerns with Parts: 1.6.1 and 1.6.2 as written --- For example, how would a Registered Entity be expected to provide evidence? NRG request additional examples of evidence in the Measures section of the requirement.

NRG suggests rephrasing “when the method to do so is available to the Responsible Entity from the software source” to “when the vendor supplied method to do so is available to Responsible Entity”. Otherwise the “method to do so” may be ambiguous and leaving the following questions:

How does one prove that a method is not available?

What is the line between available/unavailable? How far do you have to go?

NRG is concerned with double jeopardy potential with CIP-007 R2. NRG is concerned that it may be difficult or impossible to validate the source or verify authenticity of the patch itself which may cause the industry to not consider that patch to be available.

ITC Holdings believes the wording of CIP-010-3 leaves a lot of room for interpretation and needs to be more prescriptive. The measures should define technical examples (e.g., denote MD5 fingerprint or hashing as being an acceptable method). Additionally, ITC recommends including Remedy in the Technical Guidance document if you can't use the file integrity method.

Texas RE notes that the proposed standard is not responsive to the FERC directive. FERC Order No. 829 P. 59 specifically states "The new or modified Reliability Standard must address the provision and verification of relevant security concepts *in future contracts* for industrial control system hardware, software, and computing and networking services associated with bulk electric system operations." The Note in Part 1.6, however, states: "Additionally, the following issues are beyond the scope of Part 1.6: (1) the actual *terms and conditions of a procurement contract*; and (2) vendor performance and adherence to a contract." Texas RE agrees that it is unreasonable to hold a registered entity accountable for a vendor's adherence to (or lack of adherence to) a contract. Texas RE agrees as the SDT claims obtaining specific controls in the negotiated contract may not be feasible at all times but Texas RE believes this is *best practice*. In fact, in most cases contracts for these types of systems typically include security provisions and set similar expectations as described in the standard. The proposed standards would prohibit the compliance monitor from verifying the registered entity implemented part 1.6. Moreover, this verification is to ensure that the registered entities' plans are consistent with the contract's expectations and obligations of the parties.

Admittedly, there will be circumstances in which a contracts may not be consistent or silent as it pertains to the responsible entity's security management plans (e.g. existing contacts or contracts in which the responsible entity was unable to negotiate the appropriate terms into the contract.) In those circumstances, other evidence should be provided demonstrating that the responsible entity has processes to ensure the vendor is expected/obligated to act consistent with the responsible entity's cyber security risk management plans as it relates to the vendor's products or services. Therefore, the contracts should remain in scope as to demonstrate the mapping of expectations from the plan to the contract as far as vendor interactions for those specific items included in the standard and to advance best practices leading to a more reliable BES.

Texas RE also recommends the SDT remove or provide clarity on the verbiage that reads, "*and when the method to do so is available to the Responsible Entity from the software source*". A potential scenario exists now where vendors will attest that identity and integrity methods are not available therefore Part 1.6 is not applicable.

Texas RE notes that the words "integrity" and "authenticity" are used in the Guidelines and Technical Basis however Part 1.6 uses the words "identity" and "integrity". Are these intended to be the same?

4. The SDT removed low-impact BES Cyber Systems from the applicability in CIP-013-1 and is not proposing any new requirements for these cyber systems. The SDT believes that the proposed applicability to high and medium impact BES Cyber Systems appropriately focuses industry resources on supply chain cyber security risk management for industrial control system hardware, software, and computing and networking services associated with BES operations, as specified in Order No. 829. Do you agree with the SDT's removal of low impact BES Cyber Systems from CIP-013-1? If you do not agree, or if you agree but have comments or suggestions, please provide your recommendation and explanation.

While the IRC members do not have Low Impact Bes Cyber Systems we have multiple interfaces with our Market Participants that do have Low Impact BES Cyber Systems. This, in turn represents, risk to our BES Cyber Systems. As such we recommend that CIP-013-1 apply to Low Impact BES Cyber Systems to reduce the supply chain risk not only to the Low Impact BES Cyber Systems but to the IRC member organization's BES Cyber Systems.

Note: **PJM does not support this comment**.

Steven Rueckert - Western Electricity Coordinating Council - 10

Answer	No
Document Name	

Comment

While the initial direction of CIP-013-1 is good and provides protection for High BCS and Medium BCS, similar Cyber Assets associated with Low impact BES Cyber Systems may represent vectors for attack to High BCS or Medium BCS if left unprotected. WECC understands the reluctance of industry to incorporate Low impact BCS and their component BCA and other Cyber Assets under the CIP-013-1 purview and supports remanding SCRM issues associated with Low impact BCS to the CIP-003 Standard Drafting Team for integration into R1.2 and R2 of that Standard to ensure SCRM is integrated into those BCS at a level commensurate with the risk posed to the reliability of the BES.

Venona Greaff - Oxy - Occidental Chemical - 7, Group Name Oxy	
Answer	Yes
Document Name	

Comment
Oxy agrees with the removal of low impact BCS from CIP-013-1 and agrees that the current standard as written appropriately addresses the Commission's concerns as specified in Order No. 829. Oxy believes that for entities that have a mixture of high, medium and low impact assets, the low impact assets would inherently benefit from the requirements applicable to high and medium impact assets as a matter of normal business practice, as the high water mark will be applied when purchasing equipment and services. This will account for a large portion of low impact BES Cyber Systems. Oxy believes it is appropriate to address the supply chain requirements using this risk-based approach. Low impact BES Cyber Systems are categorized as low impact because they inherently pose a low risk to negatively impact the Bulk Electric System. Resources should focus on those systems that have the potential for significant adverse impact on the BES. Additionally, vendors will not differentiate their product as low, medium or high impact, so as vendors address the requirements of high and medium impact entities, low impact entities will acquire the same products and services as medium and high impact entities. If low impact BES Cyber Systems were included in CIP-013-1, the costs associated with compliance would far outweigh the risk posed to the BES, in both manpower and additional equipment and services.

Comment	
Duke Energy agrees with the removal of low-impact BES Cyber Systems from the applicability of CIP-013-1. Low-impact BES Cyber Systems have been subject to a risk assessment and classified low-impact since they pose a minimal threat to the BES. Also, a Responsible Entity is not required to have an inventory list of its low-impact BES Cyber Systems. If this standard were to apply to low-impact BES Cyber Systems, this would likely create a situation wherein an inventory list is necessary. This would be a significant effort, which would not likely bolster the reliability of the grid, based on the limited impact lows present to the system.

Luminant believes it is appropriate to address the supply chain requirements using a risk-based approach. Low impact Cyber Systems are categorized as low impact because they inherently have a low ability to negatively impact the Bulk Electric System. We should focus our resources on those systems that have the potential for significant adverse impact on the BES. In addition, there are many types of low impact Cyber Systems. If a decision was made to put them back into the standard, there would need to be extensive work on evaluating each of these types of systems in order to determine whether there is adequate benefit to reliability to offset the cost and burden of imposing supply chain requirements for these systems.

Texas RE's opinion is that low impact BES Cyber Systems should be included in CIP-013-1 because industrial control systems monitor and operate BES Cyber Assets located at transmission substations, wind farms, and generation facilities.

Texas RE noticed that Question 4 uses the words "hardware, computing and networking services", which are not found in CIP-013-1. Should they be used in CIP-013-1 instead of "equipment, products, and services"?

Recommend changing this General Consideration from

Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in the contract do not determine whether the contract is within scope of CIP-013-1.

To

Supply Chain Risk Management plan must be used by the procurement processes that begin on or after the implementation date. Make corresponding change to the CIP-013 R2 note

Implementation Plan does not handle unplanned changes such as IROLs or registration, etc.

Request a 24 months implementation due to budget cycles and technical controls for other CIP Standards

SMUD generally agrees with an 18-month implementation plan but, would prefer a 24-month implementation plan. SMUD feels that a 24-month timeframe is more appropriate and gives the entity additional time to align budgets and develop processes with vendors and suppliers. SMUD is indicating a “no” response as the implementation plan does not include a pilot. The implementation of TCA CIP 010 R4 was difficult as entities did not have a model implementation to learn practical applications of the standard in operations. Other standards that had a pilot allowed entities to learn practical implementation decisions that would save money and time. Please note, SMUD is willing to participate as a pilot participant.

It is uncertain when purchasing activities become subject to CIP-013-1. The proposed Implementation Plan states: “Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in the contract do not determine whether the contract is within scope of CIP-013-1.”

Reclamation recommends that the “General Considerations” guidance contained in the Implementation Plan pertaining to purchasing activities be included in the proposed standard.

If the “General Considerations” guidance on purchasing activities becomes part of the proposed standard, Reclamation further recommends:

- A contract becomes within scope when the entity commences its formal contract process such as when a request for proposal or solicitation is issued.
- Any direct purchase and/or any repurposed equipment is within scope prior to connecting to the Bulk Electric System as a cyber asset.

CIP-013 R2 and/or the Implementation Plan should contain “trigger” language for R2 that clarifies an entity must implement its R1 risk management plan(s) for new procurement contracts signed on or after the Effective Date of CIP-013. Entities with no new procurement contracts or no new in-progress procurements on the Effective Date should not be expected to be able to demonstrate compliance with R2 at that time.

GRE and the NRECA supports the new implementation plan timeframe. However, this implementation plan unintentionally removes the provisions for additional time to implement unplanned changes in CIP-005 and CIP-010 that was provided in the V5 and V6 implementation plans. NRECA strongly requests that the language from the “Planned or Unplanned Changes Resulting in a Higher Categorization” section of the CIP V5 standards implementation plan be re-inserted into the supply chain implementation plan.

Additionally, the absence of the “Applicable Facilities” section or other language that clearly indicates these standards/requirements do not apply to “low” entities is missing in the Implementation Plan. NRECA urges the SDT to add this section the Implementation Plan.

Brandon Cain - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer	Yes
Document Name	

Comment

Southern recommends that the SDT consider addressing previous issues with the Implementation Plan versions between CIP V5, V6, V7, etc., where Implementation Plans were "chained" together and there was not an Implementation Plan that contained all the necessary requirements in a single source. Southern strongly recommends producing a consolidated Implementation Plan.

Southern recommends that NERC and the SDT(s) consider addressing issues with the Implementation Plan versions between CIP V5, V6, V7, and Supply Chain, as Implementation Plans are "chained" together and there is no one Implementation Plan that contains all the necessary requirements in a single source. Implementation Plans for the CIP standards cover several important areas:

Implementation schedules of new or modified CIP standard requirements.

Implementation schedules for newly identified cyber assets brought into scope with current requirements based on planned or unplanned changes in the BES assets, or those from newly registered NERC entities. (previously known as IPFNICANRE – Implementation Plan for Newly Identified Cyber Assets or Newly Registered Entities)

Implementation schedules for BES Cyber Systems already in scope that change impact levels due to planned or unplanned changes in the BES.

As an example, the last page of the Implementation Plan for CIP-003-7 states that CIP-003-6 is retired upon approval of CIP-003-7, yet it chains to the CIP-003-6 Implementation Plan to tell entities how to handle cyber systems that change impact categorization. The CIP-003-6 implementation plan simply says it replaces *parts* of the V5 implementation plan for the modified standards in that revision. Only the V5 plan addresses the 2nd bullet point above. Responsible Entities are left to unravel three different plans with supply chain adding yet another to get one picture of what is due when and knowing how to handle BES changes that affect cyber system identification and impact categorization.

As we go forward, we need a better solution. Parts of an implementation plan, such as bullets 2 and 3 above, need to live on indefinitely. Other parts, such as the schedule of new or modified requirements, need to live until those dates have passed. Chaining all of this together through numerous documents as the CIP standards continue to evolve and grow to cover new areas is not a sustainable solution that promotes clarity in knowing the compliance obligation in a changing environment.

We agree with APPA's submitted comments, including: Suggesting a change in wording to say that the Supply Chain Risk Management Plan must be used on or after the implementation date rather than saying that contracts on or after that date are within scope of CIP-013. Clarification should be made about if/when existing contracts or agreements come into scope.

While in overall agreement with the updated Implementation Plan, ACEC does have the following concern: The second paragraph in the section “General Considerations” states “Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in the contract do not determine whether the contract is within scope of CIP-013-1.” Based upon the above wording it could be understood that Master Supply Agreements (MSAs) would need to be changed in the first RFP after implementation of the new standard. The paragraph should state specifically that this is not required, and that the plan can allow MSAs to exist as is until it is time to review in the normal procurement process.

NRECA supports the new implementation plan timeframe. However, this implementation plan unintentionally removes the provisions for additional time to implement unplanned changes in CIP-005 and CIP-010 that was provided in the V5 and V6 implementation plans. NRECA strongly requests that the language from the “Planned or Unplanned Changes Resulting in a Higher Categorization” section of the CIP V5 standards implementation plan be re-inserted into the supply chain implementation plan. Additionally, the absence of the “Applicable Facilities” section or other language that clearly indicates these standards/requirements do not apply to “low” entities is missing in the Implementation Plan. NRECA urges the SDT to add this section the Implementation Plan.

Recommend changing this General Consideration from:

Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in the contract do not determine whether the contract is within scope of CIP-013-1.

To:

Supply Chain Risk Management plan must be used by appropriate procurement processes that begin on or after the implementation date. Make corresponding change to the CIP-013 R2 note.

Further, USI requests clarification on if/when existing contracts, master contracts, or long-term maintenance agreements that re-opened for renegotiation or put in use, come into the scope of CIP-013.

The implementation Plan does not handle unplanned changes such as IROLs or registration, etc. Request that the Implementation Plan be modified to handle entities that meet the applicability after the effective date of the standard.

USI believes a 24-month implementation should be used due to budget cycles and technical controls for other CIP Standards.

GSOC supports NRECA's Comments of:

NRECA supports the new implementation plan timeframe. However, this implementation plan unintentionally removes the provisions for additional time to implement unplanned changes in CIP-005 and CIP-010 that was provided in the V5 and V6 implementation plans. NRECA strongly requests that the

language from the “Planned or Unplanned Changes Resulting in a Higher Categorization” section of the CIP V5 standards implementation plan be re-inserted into the supply chain implementation plan.

Additionally, the absence of the “Applicable Facilities” section or other language that clearly indicates these standards/requirements do not apply to “low” entities is missing in the Implementation Plan. NRECA urges the SDT to add this section the Implementation Plan.

Kara White - NRG - NRG Energy, Inc. - 3,4,5,6 - FRCC,MRO,WECC,Texas RE,NPCC,SERC,SPP RE,RF

Answer	Yes
Document Name	

Comment

NRG recommends changing this General Consideration from:

Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in the contract do not determine whether the contract is within scope of CIP-013-1.

To

Supply Chain Risk Management plan must be used by the procurement processes that begin on or after the implementation date. Please consider making the corresponding change to the CIP-013 R2 note

The Implementation Plan does not appear to address unplanned changes such as IROLs or registration, etc.

NRG requests consideration of a 24 month implementation due to budget cycles and technical controls for other CIP Standards

Texas RE requests that the SDT provide its rationale for extending the effective date from 12 to 18 months. For example, it is unclear whether the SDT believes more certainty is required regarding the necessary technical deployments for compliance with the Standard as some commenters suggested to justify the extended implementation period.

6. The SDT revised the Violation Severity Levels (VSLs) for requirements in CIP-013-1, CIP-005-6, and CIP-010-3. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the proposed requirements? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs, please provide your recommendation and explanation.

Colby Bellville - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy

Answer	No
Document Name	

Comment

Duke Energy suggests the drafting team consider implementing a staggered approach to the VSL(s) specifically to CIP-013-1 R2. As written, an entity could implement all aspects but one sub-part of the risk management plan, and the violation would have a VSL of Severe. We recommend the drafting team consider a more equitable approach and stagger the VSL(s) similar to the approach used in R1 of CIP-003-6.

We do not agree with the VRF Justification for CIP-013-1 R1, FERC VRF G5 with the new redline. Agree with the words that were redline out.

CIP-010 – VSL does not cover the failure to implement the process and therefore does not include all of the combinations. Consequently, we request that there be lower severity levels when a single aspect of the requirements is missing.

Request that that the term “elements” be included in CIP-013 R1.2 (as shown in comments for question 1) to clearly align with the VSLs for this requirement.

The VSL for R2 only provides for a Severe VLS. It is unclear what is meant by "did not implement". If your plan has 5 areas within it and 4 of the 5 were fully implemented, has the plan been implemented? I contend yes however not fully implemented. The VSL were created to identify how far of the complaince mark an entitiy fell. This VLS completly fails to perform this action. While at the same time the VSL for R3 utilizes arbitrary calendar months

for clear VLS seperation between lower and severe. Both of these VLS provide little benefit to industry in assessing the real impact to the BES based on an entity missing the complaince mark.

The IRC suggests the drafting team add more thresholds to the VSLs for R2 of CIP-013-1 and that it be aligned more closely with that of R1, rather than making it binary. The cyber security risk management plan will be fairly large and missing small portions of the plan should not immediately result in a Severe VSL.

SRP agrees with the VRFs and VSLs for CIP-010 and CIP-013. SRP believes that the VRFs and VSLs for CIP-005 should be updated to reflect the same approach that was taken in CIP-010. The VSL for CIP-005 results in a severe penalty if the entity did not have a method to determine and did not have a method to disable. SRP would prefer a High VSL penalty if the entity has a process to determine but does not have a process to disable and vice-versa if the entity did not have a process to determine but does have a process to disable.

SRP requests that the term “elements” be included in CIP-013 R1.2 (as shown above) to clearly align with the VSLs for this requirement.

7. The SDT developed draft Implementation Guidance for CIP-013 to provide examples of how a Responsible Entity could comply with the requirements. The draft Implementation Guidance does not prescribe the only approach to compliance. Rather, it describes some approaches the SDT believes would be effective ways to comply with the standard. See NERC's Compliance Guidance policy for information on Implementation Guidance. Do you agree with the example approaches in the draft Implementation Guidance? If you do not agree, or if you agree but have comments or suggestions for the draft Implementation Guidance, please provide your recommendation and explanation.

CHPD is uncertain if this new approach best provides assurance and guidance about these new Standards in the absence of the “Guidance and Technical Basis” sections in each Standard and the intentional flexibility of CIP-013 in particular. CHPD is concerned about the possibilities that NERC and the Regions (1) may not endorse the separate implementation guidance at all, (2) may not endorse the guidance in a timely manner with regard to balloting, and (3) may withdraw previously-granted endorsement should FERC request revisions to the Standard. As such, CHPD would prefer to see the new “Implementation Guidance Document” supplemented with “Guidance and Technical Basis” sections in each Standard.

Comment
The existing guidance still provides no scope of cyber security risks that should be considered, and without context, many of the proposed actions have no guidelines or measurements for “success” or “failure” or acceptability; nor are there suggested acceptable mitigations if a criterion is not completely met, since there is no clear objective. Furthermore, there is no allowance made for a continuous process, where, as a result of products already being used in BES Cyber Systems and subjected to the existing CIP standards, cyber security risks associated with networks, products and vendors are evaluated on an on-going basis. Detailed changes and additions are outlined in a separate redline Draft Implementation Guidance document that has been forwarded to NERC and the SDT. A summary of the proposals is as follows: 1. Throughout the document, the term ‘controls’ should be changed to a term that more closely reflects the language in the proposed standard. Dominion recommends using ‘terms and conditions’. 2. On page 2, dominion recommends clarifying that cyber security risks are limited to supply chain with the addition of ‘supply chain’ prior to each use of the term cyber security risks. 3. In addition to the clarifying language in item #2 above, Dominion recommends adding the following to more clearly define the term ‘supply chain cyber security risk: (1) procuring and installing un-secure equipment or (2) procuring and installing un-secure software, including purchasing counterfeit software, or software that has been modified by an un-authorized party, (3) unintentionally failing to anticipate security issues that may arise due to network

architecture, (4) unintentionally failing to anticipate security issues that may arise during technology and vendor transitions for BES Cyber Systems). The additional bullets could be sub-bullets under the appropriate of these four broad areas as examples rather than individual, isolated items.

4. Dominion recommends deleting the third paragraph on page 2. This paragraph appears to be creating new/different obligations. The language appears to create confusion and calls out Section 1.2.5 specifically for no apparent reason.

5. The language in blue boxes throughout the document should be retained and included in the text of the document.

6. It is unclear what the purpose of including certain language in a blue box is.

7. Section headings should be included with each of the examples. Also, the bulleted format makes it unclear if one, all, or a certain number of bulleted items need to be performed to achieve compliance.

8. Add the following example under R1.1:

Develop an approved vendor/products list. When planning a BCS, the RE should evaluate the following items:

-
    - Vendors
    - Products
    - Network Architecture
    - Network Components.

The RE should document (which may be limited to the baseline and cyber vulnerability assessment (CVA) required for a new product) any risks (i.e. 1) procuring and installing un-secure equipment or (2) procuring and installing un-secure software, including purchasing counterfeit software, or software that has been modified by an un-authorized party, (3) unintentionally failing to anticipate security issues that may arise due to network architecture, (4) unintentionally failing to anticipate security issues that may arise during technology and vendor transitions for BES Cyber Systems) identified and how the risks are mitigated for any “item” that deviates from those vendors, products, network architecture, and network components already being used within the RE’s BCS infrastructures, which are required to comply with existing CIP standards.

9. The second bullet in Section 1.2.2 should be removed. It is already addressed under Section 1.2.1.

10. In Section 1.2.3, the end of the first bullet could state be clarified as follows:

Delete ‘within a negotiated period of time of such determination’ and replace with “to allow the RE to remove access within 24 hours of the determination, consistent with existing CIP standards”

Replace ‘breaches’ with ‘vulnerabilities’ for clarity and consistency’.

Patricia Robertson - BC Hydro and Power Authority - 1, Group Name BC Hydro

Answer	No
Document Name	

Comment

BC Hydro does not agree with the examples as compliance will be challenging. It would require us to have sufficient authority over the vendor (which will not be the case in most situations). There is also no way to ensure that a vendor is being completely transparent regarding cyber vulnerabilities in their product. Such disclosure could have other impacts on their business with other clients. This would be a dis-incentive for disclosure. BC Hydro does not believes CIP-013 is necessary and cyber control is already achieved with the rest of the CIP v5 standard requirements around change control, testing and ongoing systems monitoring.

Wendy Center - U.S. Bureau of Reclamation - 5

Answer	No

Document Name	

Comment

It is uncertain when purchasing activities become subject to CIP-013-1. The proposed Implementation Plan states: “Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in the contract do not determine whether the contract is within scope of CIP-013-1.”

Reclamation recommends that the “General Considerations” guidance contained in the Implementation Plan pertaining to purchasing activities be included in the proposed standard.

If the “General Considerations” guidance on purchasing activities becomes part of the proposed standard, Reclamation further recommends:

- A contract becomes within scope when the entity commences its formal contract process such as when a request for proposal or solicitation is issued.
- Any direct purchase and/or any repurposed equipment is within scope prior to connecting to the Bulk Electric System as a cyber asset.

Tho Tran - Oncor Electric Delivery - 1 - Texas RE

Answer	No
Document Name	

Comment

There is inconsistency between the Implementation Guidance and CIP-010, R1. The requirement states “For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5”. The Guidelines and Technical Basis section heading Software and Authenticity, paragraph three on page 39, states: “It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches.”

The requirement wording suggests it applies for any change but the Guidance suggests that for some changes, such as patches, it would not apply. Oncor believes that automated patch deployment solutions should be able to verify the identity and integrity of the patch. Therefore, it is believed that the best solution is to modify the Guidance.

Definition of vendor is not a NERC defined term. The term “vendor” is also used in the proposed CIP-005.

USI believes the SDT should provide guidance regarding the use of the term “vendor.” If “Vendor” is not defined by NERC, the Guidance should recommend that Entities include their definition of “vendor” in their plan(s).

Implementation Guidance for R3

Neither main bullet meets compliance because both only deal with the review and not the approval. Therefore, USI recommends changing: ”Below are some examples of approaches to comply with this requirement: “ to “Below is an example of an approach to comply with the review requirement required by: “

In addition, we recommend removing this language from the second main bullet, since it is beyond the Requirement:

“Upon approval of changes to the supply chain cyber security risk management plan(s), the CIP Senior Manager or approved delegate should provide appropriate communications to the affected organizations or individuals. Additionally, communications or training material may be developed to ensure any organizational areas affected by revisions are informed.”

Also, there should be corresponding “Guidelines and Technical Basis” or “Rationale” for CIP-005-6 Requirement R2 Parts 2.4 and 2.5.

- The language within the Implementation Guidance contradicts the language within CIP-013. (i.e. System-based approach). The Implementation Guidance is not auditable, however, the Standard and Requirements are. EDPR NA suggests that the Implementation Guidance is eliminated and further support are provided within the Measures for a Registered Entity and auditor’s reference.
- There are numerous items in which vendors will not provide information on unless an entity is willing pay significant increases (risks, training, methodologies, threats, etc.)
- EDPR NA also suggests that NERC utilize a pilot program to test these requirements prior to enforcing the implementation of CIP-013 to all Registered Entities.

- Please provide more support with respect to the expectations and possible evidence for Requirement 2.

There appears to be inconsistency between the requirement and the Guidelines in CIP-010 R1.

The requirement states, in relevant part, “For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5.”

The Guidelines and Technical Basis section heading “Software and Authenticity,” paragraph three on page 39, states: “It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches.” The wording of the CIP-10-3 R1.6 Guidelines and Technical Basis section seems to imply that every time a patch/software is downloaded it does not have to be checked. Based on how the standard is written, the software source and the software must be verified each time something is downloaded. Even if that software was previously downloaded, the source must be validated and so must the software before application.

Furthermore, the requirement wording suggests it applies for any change but the Guidelines suggests that for some changes, such as patches, it would not apply. As the requirement is auditable and the Guidelines are not, the Guidelines become superfluous. The Guideline also introduces significant ambiguity that is impossible to audit. SPP recommends that the SDT review the Guidelines and the draft standard for consistency and resolution.

In addition, SPP recommends that because automated patch deployment solutions should be able to verify the identity and integrity of the patch, the SDT consider allowing for this method of verification in the Measures or Guidelines.

SPP notes that there is no corresponding “Guidelines and Technical Basis” or “Rationale” for CIP-005-6 Requirement R2 Parts 2.4 and 2.5.

Yes, and BPA disagrees with the language in Requirement R3 requiring the CIP Senior Manager or delegate approve the supply chain cyber security risk management plans. Other CIP standards, such as CIP-003-6, Requirement R1, require CIP Senior Manager approval of “policies,” not “plans.” In

Order No. 829, the Federal Energy Regulatory Commission stated, "*Consistent with or similar to the requirement in Reliability Standard CIP-003-6, Requirement R1*, the Reliability Standard should require the responsible entity's CIP Senior Manager to review and approve the controls adopted to meet the specific security objectives identified in the Reliability Standard at least every 15 months." Order No. 829 at P46 (emphasis added). Requiring CIP Senior Manager approval of plans is not consistent or similar to requiring approval of policies because plans are more tactical and numerous than policies. CIP Senior Manager approval should apply only to overarching strategic documents, and not to approval of highly detailed plans for implementation of processes. Instead, CIP-013 should be added to the list of policies requiring CIP Senior Manager approval in CIP-003-6, Requirement R1.

The understanding of the intent and purpose of CIP-013 is very dependent on the Implementation Guidance document. We are concerned about the possibilities that NERC and the Regions (1) may not endorse the separate implementation guidance at all, (2) may not endorse the guidance in a timely manner as regards balloting, and (3) may withdraw previously-granted endorsement should FERC request revisions to the Standard. As such we would prefer to see the new "Implementation Guidance Document" supplemented with "Guidance and Technical Basis" sections in each Standard.

Yes, the Compliance Guidance policy does provide industry with direction for implementation. However, those guidance details are not written in the requirements, measures or Reliability Standard Audit Worksheet (RSAW) and cannot be relied upon in preparation of an audit. ACES would suggest, at a minimum, that these guidelines be written in the Supply Chain Management RSAWs in the section 'Notes for an Auditor'. By placing this information in the RSAW, it gives industry additional reassurance that each region will audit Supply Chain Management consistently.

Implementation Guidance for R3

Neither main bullet meets compliance because both only deal with the review and not the approval. Recommend changing “Below are some examples of approaches to comply with this requirement:” to “Below is an example of an approach to comply with the review requirement required by:”

Implementation Guidance for R3 –

Recommend removing this language from the second main bullet, since it is beyond the Requirement

“Upon approval of changes to the supply chain cyber security risk management plan(s), the CIP Senior Manager or approved delegate should provide appropriate communications to the affected organizations or individuals. Additionally, communications or training material may be developed to ensure any organizational areas affected by revisions are informed.”

For consistency and clarity between sub-requirement 1.2.2. and the CIP-013-1 Implementation Guidance, we suggest that “cyber security incident(s)” be removed from the examples for 1.2.2. This verbiage should be replaced with either “vendor-identified incidents” or “security event(s)” as referenced in the examples for 1.2.1.

PRPA generally agrees with the Implementation Guidance for CIP-013 and feels that this is a promising new approach but is uncertain if the approach best provides assurance and guidance about these new Standards in the absence of the “Guidance and Technical Basis” sections in each Standard and the intentional flexibility of CIP-013 in particular. PRPA is concerned about the possibilities that NERC and the Regions (1) may not endorse the separate implementation guidance at all, (2) may not endorse the guidance in a timely manner as regards balloting, and (3) may withdraw previously-granted endorsement should FERC request revisions to the Standard. As such, PRPA would prefer to see the new “Implementation Guidance Document” supplemented with “Guidance and Technical Basis” sections in each Standard. R3: PRPA requests that the following language be removed from the second main bullet, since it is out of scope for this Requirement. “Upon approval of changes to the supply chain cyber security risk management plan(s), the CIP Senior Manager or approved delegate should provide appropriate communications to the affected organizations or individuals. Additionally, communications or training material may be developed to ensure any organizational areas affected by revisions are informed.” Request that there be corresponding “Guidelines and Technical Basis” or “Rationale” for CIP-005-6 Requirement R2 Parts 2.4 and 2.5 and CIP-010-3 R1.6.

Amelia Sawyer - CenterPoint Energy Houston Electric, LLC - 1 - Texas RE	
Answer	Yes
Document Name	
Comment	

In the guidance for Requirement R1, Part 1.2.5, CenterPoint Energy believes including all third-party hardware, software, firmware, and services goes beyond the scope of the requirement. Most systems consist of components or services from numerous third-party companies. The vendor of such systems may not have direct contact with third-party companies. The level of third-party components or services that could be expected to be included may be quite extensive and therefore make it impractical for the vendor to commit to such issues in contract provisions.

Andrew Meyers - Bonneville Power Administration - 6	
Answer	Yes
Document Name	
Comment	

Yes, and BPA disagrees with the language in Requirement R3 requiring the CIP Senior Manager or delegate approve the supply chain cyber security risk management plans. Other CIP standards, such as CIP-003-6, Requirement R1, require CIP Senior Manager approval of "policies," not "plans." In Order No. 829, the Federal Energy Regulatory Commission stated, "*Consistent with or similar to the requirement in Reliability Standard CIP-003-6, Requirement R1*, the Reliability Standard should require the responsible entity's CIP Senior Manager to review and approve the controls adopted to meet the specific security objectives identified in the Reliability Standard at least every 15 months." Order No. 829 at P46 (emphasis added). Requiring CIP Senior Manager approval of plans is not consistent or similar to requiring approval of policies because plans are more tactical and numerous than policies. CIP Senior Manager approval should apply only to overarching strategic documents, and not to approval of highly detailed plans for implementation of processes. Instead, CIP-013 should be added to the list of policies requiring CIP Senior Manager approval in CIP-003-6, Requirement R1.

Answer	Yes
Document Name	
Comment	

While in overall agreement with the Implementation Guidance for CIP-013, ACEC does have the following concern:

In the Implementation Guidance for R1 Section of the document, the subsections for implementation of Requirement R1 Parts 1.2.1, 1.2.2, 1.2.4 and 1.2.5 use the generic term "vendor(s)" in discussing these Software Authenticity and Integrity issues. To help in ensuring that these requirements are implemented in an effective manner, it is recommended that the SDT add a clarification item, noting that these requirements be addressed by the OEM providing the hardware and/or software, not a third-party such as an integrator.

Comment
N&ST has no disagreement with the example approaches contained in the Guidance but believes that while they may represent reasonable courses of action for large entities, they are likely to be far beyond the capabilities of small ones. N&ST believes an entity whose combined BES operations, OT support, and CIP compliance teams comprise fewer than 10 individuals would be hard-pressed to “form a team of subject matter experts from across the organization to participate in the BES Cyber System planning and acquisition process(es).” N&ST also believes, based on experience with CIP V1 – V5 cyber security training requirements, that large vendors with many BES customers will balk, sooner or later, at being asked to respond to a multitude of risk assessment requests, questionnaires, meetings, etc., each one different from the previous ones, and will instead incline towards providing a standardized set of information about their internal risk management programs and how they are applied to their products and services.

8. The SDT believes proposed CIP-013-1 and the draft Implementation Guidance provide entities with flexibility to meet the reliability objectives in a cost effective manner. Do you agree? If you do not agree, or if you agree but have suggestions for improvement to enable additional cost effective approaches, please provide your recommendation and, if appropriate, technical justification.

William Harris - Foundation for Resilient Societies - 8

Answer	No
Document Name	

Comment

We consider the requirements to be burdensome, and impractical for many or most electric utilities without providing needed protection of the cyber supply chain. We would suggest at the outset adoptioon of a separate FERC rulemaking to detect, report, mitigate and remove malware from the bulk electric system.

Comment

By placing those comments and guidance in the Implementation Guidance does not provide industry protection during an audit in defining ‘cost effective manner’. If it is important to communicate to industry that Supply Chain Management can be managed in a ‘cost effective manner’, then that should be detailed in the standards. ‘Cost effective manner’ is an undefined term and will be different for each entity, budget and their resources. The focus should be modified to a ‘risk reduction manner’ or ‘risk appropriate manner’.

This new standard will put additional burden on entities. It is going to take considerable time to implement and negotiate new contracts. It is also up to the entity to provide adequate documentation to prove compliance but it will still be based on the auditor discretion if an entity has done enough. As with similar requirements in the nuclear industry we believe that contract pricing will increase due to the Standard requirements placed on the vendors via industry and may result in reduction of vendor options.

N&ST believes the approaches to meeting CIP-013's reliability objectives described in the Implementation Guidance could easily consume scores, if not hundreds, of staff hours, with the potential to make "vendor risk assessment(s)" a significant cost component of any large-scale procurement. N&ST notes that although most of the documents referenced in the Guidance document are available for download at no charge, the Shared Assessment Program's Standardized Information Gathering (SIG) questionnaire, referenced in a footnote, must be purchased for $6,000. The Guidance document does point out that a Responsible Entities are free to pursue different approaches to CIP-013 implementation that "better fit their situation," but provides no examples of alternatives that might be worth considering. N&ST encourages NERC and the SDT to consider how utilities with very small staffs and very limited budgets might reasonably address their CIP-013 obligations.

CHPD believes that the language proposed in CIP-013-1 Draft 2 will result in vendor costs that outweigh, or possibly reverse, the current security and reliability of the BES. Vendors are likely to (1) significantly increase quoted implementation costs, (2) counter terms with alternate language that may not comply with the Standard, or (3) elect to no longer do business with small-to-medium sized entities due to added contractual complexity.	

Vendors are not subject to enforcement and therefore should not be identified in any CIP Standards. As a result, CHPD proposes that the requirements be written in a less prescriptive manner that enables entities responsible for CIP-013 compliance to have control over the process through the use of performance-based activities.

The performance-based assessment requirements would be improved if worded in a way that allows the acceptance of any outcome reached by each Responsible Entity (e.g., “Each Responsible Entity shall <insert performance activity> and document the results of the assessment.”). The intent should be to create a dialog between the entities and vendors on these topics rather than just documented within contractual language.

By not clarifying “cyber security risks” in R1 Part 1.1 the SDT is not providing flexibility, but rather compliance risk to Registered Entities. See our comments to questions 1 and 7, above, regarding the Implementation Guidance. As it stands, the document provides no guidance and raises additional, possible compliance risk as to interpretation of what “cyber security risks” are.

Vendors are not subject to enforcement and therefore should not be identified in any CIP Standards. As a result, CHPD proposes that the requirements be written in a less prescriptive manner that enables entities responsible for CIP-013 compliance to have control over the process through the use of performance-based activities.

The performance-based assessment requirements would be improved if worded in a way that allows the acceptance of any outcome reached by each Responsible Entity (e.g., “Each Responsible Entity shall and document the results of the assessment.”). The intent should be to create a dialog between the entities and vendors on these topics rather than just documented within contractual language.

We support the changes and believes that most aspects of CIP-013 may be achieved cost-effectively (if not necessarily cheaply), with two exceptions.	

One exception is if the eventually determined audit approach to CIP-013 effectively precludes use of regional master contracts and piggyback agreements, then cyber asset procurement expenses will increase for municipal utilities, smaller entities and co-ops, and other public utilities with little or no benefit. Costs will increase for (i) the procurement process itself, because utilities will need to research specifications and develop contracts individually in place in pre-negotiated master agreements, and for (ii) each purchase, because aggregated buying power and large-purchase discounts will be lost. To minimize these risks, USI strongly urges that audit approach language for CIP-013 R2 be clarified as to clearly identify the acceptable use of master agreements rather than leave this determination up to individual regions and auditors.

The other exception is the implementation of CIP-005 R2.4 and R2.5 (methods to detect and disable remote access for vendors and vendor system) for existing BES Cyber Systems. Some legacy cyber systems are inherently structured and configured for vendor access, and reworking them to allow real-time detection and, especially, disabling of such access may prove extremely costly. At the same time, these changes may degrade the performance of these systems. USI suggests that the option for a Technical Feasibility Exception be allowed for legacy systems, or that legacy systems be granted an extended implementation period of up to five or ten years (during which such systems likely would be replaced).

In the Draft CIP-013-1 – Cyber Security - Supply Chain Risk Management requirement R2 includes the following: “Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.” With this note the Responsible Entity is basically directed to develop a plan yet it does not have to change procurement results. If you are not going to require results, there is no reason to add the costs of developing and implementing the program.

Comment	

The current version of the cybersecurity supply chain standard provides a starting point for advancing controls to mitigate the risks associated with vulnerabilities in the supply chain. PJM Interconnection, LLC ("PJM") is supportive of this proposed standard as a first step consistent with the overall direction provided by the FERC.

PJM wishes to point out that the proposed supply chain standard needs to further evolve through subsequent iterations based on additional experience and incorporation of best practices. Although PJM recognizes the limits of FERC's jurisdiction as it relates to suppliers to owners and operators of the bulk electric system, any effective supply chain management standard should work to create incentives for improved cybersecurity practices up the supply chain and not just place requirements on the end user (in this case the owner or operators of bulk electric system assets). Although not evident on its face, PJM is hopeful that the proposed Standard will adequately and timely incent that goal. However, as a first step, the impact of the proposed standard, once implemented, should be analyzed with this goal in mind.

In order for supply chain risks to be substantially mitigated it will require broader cross sector engagement, broad government engagement and a significant shift in how vendors and service providers deliver products and services. Broader engagement is also required to ensure an equitable allocation of liabilities and costs. Eventually vendors and service providers will differentiate themselves by how well they manage cybersecurity risks and meet these customer needs in a fair and responsible manner.

Directionally, the proposed cybersecurity supply chain standard was intended to address a broad range of technologies as opposed to a narrower view of Energy Management and Market Management System vendors. The FERC directive similarly appeared to drive this approach. By making this choice of applying the standard to a broader range of technologies the standard, almost by necessity, starts with a more general approach with is not overly prescriptive and is grounded on the principle that organizations must establish cybersecurity supply chain processes and then execute against those processes.

The standard could have been much more prescriptive had it taken a narrower approach focusing primarily on SCADA Systems, Energy Management Systems, and Market Management Systems software solutions. Clearly the more narrow approach would have allowed for additional focus on those systems most critical to ISO/RTO operations where more proscription could have been helpful to drive more specific cybersecurity controls up the supply chain. Whether a broad approach as chosen by the drafting team or a more targeted approach is better as a starting place can be legitimately debated. In any event, either can provide a starting point for making improvements in managing the cybersecurity supply chain threats. PJM believes this effort meets that initial 'out of the gate' requirement given the need for compliance with the FERC Order in a discrete time period.

Support of the cybersecurity supply chain standard will provide an incremental step in achieving our objective of significantly improving the risks associated with vulnerabilities in the supply chain.

1) Make ‘vendor’ a defined term or provide GTB explanation for what is expected to be considered a vendor.

2) Guidelines and Technical Basis for CIP-013-3 states that it is sufficient to establish a reliable software update source once to allow automated solutions to be implemented. Does this reasoning extend to manual patching? For non-automated systems can a reliable software update source be identified once?

3) Please provide implementation guidance on CIP-005 and CIP-010

4) Make ‘integrity’ a defined term or provide GTB explanation for what is expected for verifying integrity of software.

5) Please list practical ways to validate the integrity of software.

: The SDT doesn't address CIP Exceptional Circumstance (CEC) in any of the Supply Chain Standards. If an event does occur that creates a CEC, it could potentially cause an entity to not be able to monitor vendor remote access verification of software integrity and authenticity. In Order No. 829, it states, "new or modified Reliability Standard to require each affected entity to develop and implement a plan that includes security controls for supply chain management for industrial control system hardware, software, and services associated with bulk electric system operations." Does the drafting team have confidence that only having in scope medium and high BES Cyber Assets meets the directive for "industrial control system hardware, software, and services"?	

ACES recommends additional verbiage be written in the requirements to document what cyber assets that are not in scope for Supply Chain Management such as: Electronic Access Control and Monitoring Systems (EACMS), transient cyber assets, removable media and protected cyber assets (PCA).

Thank you for your time and consideration.

The Guidelines and Technical Basis section heading Software and Authenticity, paragraph three on page 39, states: “It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches.” The requirement wording suggests it applies for any change but the guidance suggests that for some changes, such as patches, it would not apply. As the requirement is auditable and the guidance is not, the guidance becomes superfluous. The Guideline also introduces significant ambiguity that is impossible to audit. Therefore, the IRC suggest that either the requirement wording be adjusted to allow for automated patching solutions or the Guideline be removed as it is contradictory. The IRC suggest that automated patch deployment solutions should be able to verify the identity and integrity of the patch. Therefore the best solution is to remove the guideline.

1. Make 'vendor' a defined term or provide GTB explanation for what is expected to be considered a vendor.	

2. Guidelines and Technical Basis for CIP-013-3 states that it is sufficient to establish a reliable software update source once to allow automated solutions to be implemented. Does this reasoning extend to manual patching? For non-automated systems, can a reliable software update source be identified once?

3. Please provide implementation guidance on CIP-005 and CIP-010.

4. Make 'integrity' a defimed term or provide GTB explanation for what is expected for verifying integrity of software.

5. Please list practical ways to validate the integrity of software.

ERCOT joins the comments of the IRC and offers the following additional comment: The term “vendor” that is used repeatedly in the rationale boxes requires further clarification or revision. “A *vendor*, as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.” Services cannot be manufactured, and the provision of services is already addressed through item (ii). ERCOT suggests the following revision: “A *vendor*, as used in the standard, may include: (i) developers or manufacturers of information systems or components; (ii) *providers of information systems services*; (iii) product resellers; or (iv) system integrators.”

Dominion recommends the following changes to the RSAWs:

- CIP-005-6, R2, Parts 2.4 and 2.5
  - Remove the word “all” from the “Compliance Assessment Approach sections.
- CIP-010-3, R1, Part 1.6
  - Remove the words “for each” from the “Compliance Assessment Approach section, rows 2 and 4.

- CIP-013-1, R1
    - Remove the word “controls”. The word “processes” is now in uses in the most current draft of CIP-013-1.

Patrick Hughes - National Electrical Manufacturers Association - NA - Not Applicable - NA - Not Applicable

Answer	
Document Name	NEMA Comments on NERC Supply Chain Risk Management 2017-06-12.pdf

Comment

On behalf of the National Electrical Manufacturers Association (NEMA)—a trade association and standards developing organization with nearly 350 member companies that manufacture a diverse set of products used in the generation, transmission, distribution, and end-use of electricity—and on behalf of the NEMA Grid Modernization Leadership Council and the NEMA Cybersecurity Committee, I wish to submit for your reference “CPSP 1-2015: Supply Chain Best Practices,” which describes industry best practices for manufacturers to follow regarding cybersecurity supply chain management.

“Supply Chain Best Practices” identifies guidelines that electrical equipment manufacturers can implement during product development to minimize the possibility that bugs, malware, viruses or other exploits can be used can be used to negatively impact product operation. It addresses United States supply chain integrity through four phases of a product’s life cycle: manufacturing, delivery, operation, and end-of-life. The report (attached) is available for public download at: http://www.nema.org/Standards/Pages/Supply-Chain-Best-Practices.aspx.

The National Electrical Manufacturers Association and its members understand that a secure supply chain is essential to a secure grid and that cybersecurity aspects should be built into, not bolted onto, manufacturers' products. They also understand that managing cybersecurity supply chain risk requires a collaborative effort and open lines of communication among electric utility companies and the manufacturers of critical electric grid systems and components—both hardware and software. NEMA looks forward to working with and being a resource for NERC, utilities, and other interested stakeholders in addressing supply chain risks and concerns within the energy sector.

Should you have any questions, please contact Patrick Hughes, Senior Director of Government Relations and Strategic Initiatives, at 703-841-3205 or patrick.hughes@nema.org.

Respectfully,

Kyle Pitsor

Vice President, Government Relations

The American Council of Engineering Companies (ACEC) -the business association of the nation's engineering industry - wants to convey the industry's perspectives and concerns over the development of this new cyber security supply chain rule mandated by the Federal Energy Regulatory Commission (FERC).

ACEC members firms, numbering more than 5,000 and representing over 500,000 employees throughout the country, are engaged in a wide range of engineering work that propel the nation's economy, and enhance and safeguard America's quality of life. Council members are actively involved in every aspect of the energy marketplace. Supply chain cyber security is of growing concern to all our members.

ACEC is in agreement with most of the comments of the owners, operators, vendors and suppliers that have formally participated in this Standard development.

Additional comments received from Seattle City Light

1. The SDT has revised requirements for developing and implementing supply chain cyber security risk management plans (CIP-013-1 Requirements R1 – R3) in response to stakeholder comments. Do you agree with the proposed requirements? If you do not agree, or if you agree but have comments or suggestions for the proposed requirements, please provide your recommendation and explanation.

☒ Yes

☐ No

Comments: *Note that for all comments (1-9) written in blue text come directly from APPA and/or LPPC comments. Any comments in black are City Light's.*

Seattle City Light continues to be a strong supporter of efforts to ensure the security of the Bulk Electric System and appreciates the time and effort that the SDT has put into considering industry feedback and incorporating it into the current drafts of CIP-005, CIP-010 and CIP-013.

Seattle agrees with limiting the requirement to high and medium assets only.

R1: Seattle generally agrees with the proposed Requirement 1 but is concerned about compliance obligations for procurement activities associated with multi-party wide-area contracts, master agreements and piggyback agreements. An exception, comparable to a CIP Exceptional Circumstance, might be included in the standard for these kinds of procurement activities. Alternatively, concerns about how different type of contracts—multi-party contracts, master agreements, evergreen agreements, piggyback contracts, long-term service agreements, etc, etc, etc—may or may not comply might be addressed by re-positioning CIP-013 as a performance-based Standard, with a focus on managing specific aspects of vendor security rather than particular contracting practices.

Our reasoning is that there are means other than vendor contract negotiations, contract language, and procurement processes to address and (attempt to) achieve the protections identified in R1.2. It is immaterial how these protections are pursued. Focusing vendor security plans and audit approaches on contracts and procurement (even if specific contract terms are not in scope) limits flexibility, is unnecessarily prescriptive, and does not reflect performance-based principles. As such we suggest that R1.2 be revised as follows:

1.2. *One or more process(es) for its newly procured BES Cyber Systems that address the following elements, as applicable:*

As explanation for the revisions, underlined words are added, and "newly" is intended to mean 'obtained after the implementation of CIP-013.' Also, the term "elements," as shown above, is added to more clearly align with the VSLs for this requirement.

At the same time guidance associated with the "Rationale for R1," "Rationale for R2," and the separate Implementation Guidance document should be revised to reflect the change to a performance-based requirement in which contract terms and contract negotiations play no necessary function in vendor security plans and audit approaches. Contract terms might be used by an entity in their vendor security plans and/or as evidence of performance, but there should be no expectation by auditors or subtext in the Standard or Implementation Guidance that anything having to do with contracts or procurement processes is required. There should be no expectation of what might or should be included within Requests for Proposals, no expectation of when contracts might or should be renegotiated, no expectations of what contract terms might or should be included or requested, and no expectations of what terms might or should be found in a prudent and proper contract. Ultimately there should be no expectation that CIP-013 R1.2 protections be achieved through the contracting process. Consistent with performance-based standard principles the objective in CIP-013 and in entity vendor security plans should be on achieving each protection (as feasible), not on the means by which it is achieved (or attempted to be achieved).

In the absence of such changes, we request substantial additional clarification about how, without contract terms and contract negotiations being auditable, performance of R2 implementation will be audited and assessed. In particular for state and regional master agreements, piggyback contracts, evergreen agreements, and the like.

Looking to specific details of CIP-013 requirements, Seattle requests re-wording of R1 parts 1.2.1 and 1.2.4 to better understand what is expected. These parts appear to be duplicative. The endorsed Guidance does not adequately distinguish between the two parts. One interpretation is that part 1.2.1 is for products/services and that part 1.2.4 is for vulnerabilities in the product. It is not clear if these parts expect information sharing at the time of procurement or if information sharing will be on-going?

In R1 parts 1.2.1 and 1.2.2, the term "vendor-identified incident" is unclear. It could mean incidents that were identified by another party, specific to the products of a specific vendor, or incidents identified by the vendor. Seattle suggests changing "identified" in the phrase, to "acknowledged" or "confirmed" to ensure clarity.

Definition of vendor is not a NERC defined term. The term "vendor" is also used in the proposed CIP-005.

Seattle believes the SDT should provide guidance regarding the use of the term "vendor." If "Vendor" is not defined by NERC, the Guidance should recommend that entities include their definition of "vendor" in their plan(s).

Seattle recommends removing those items (CIP-013 R1 parts 1.2.5 and 1.2.6) covered in CIP-005 and CIP-010 from CIP-013 to avoid duplication. The revised CIP-013 parts 1.2.5 and 1.2.6 appear to apply to software source and identity verification (now required "when the method to do so is available" by CIP-010) and determining active vendor remote access sessions (now required by CIP-005). Having CIP-013 parts that require entities to perform the underlying function and to take those functions into account during the procurement process is needless duplication that does not increase security or reliability and could result in compliance "double jeopardy."

R2: Seattle agrees with the requirement to implement the supply chain cyber security risk management plan as outlined in Requirement 1.

As discussed above, Seattle urges the significant additional guidance, preferably centered on performance-based principles, about expected compliance practices and how implementation will be audited. In particular for state and regional master agreements, piggyback contracts, evergreen agreements, and the like.

Finally, the Compliance and/or Implementation Guidance should make clear that, when evidence demonstrates that all items expressly identified in CIP-013, R1 are contained in a Supply Chain Cyber Security Management Plan or Plans, and are implemented pursuant to R2, entities will not be found out of compliance. More specifically, entities should not be subjected to CIP-013 noncompliance findings resulting from a difference of opinion concerning security adequacy.

R3: Seattle agrees that a 15-month review period is appropriate to review the supply chain cyber security risk management plan in Requirement 1.

Additionally, Seattle proposes that the regional entities voluntarily assess CIP-013 programs for entities who have audits in the period between standard approval and the effective date. This is similar to when the regional entities performed transition period audits of CIP v5 programs.

2. The SDT developed proposed CIP-005-6 Requirement R2 Parts 2.4 and 2.5 to address the Order No. 829 directives for controls on vendor-initiated remote access to BES Cyber Systems covering both user-initiated and machine-to-machine vendor remote access. The SDT followed an approach recommended by stakeholders during the initial posting of CIP-013-1. Do you agree with proposed revisions in CIP-005-6? If you do not agree, or if you agree but have comments or suggestions, please provide your recommendation and explanation.

☒ Yes

☐ No

Comments: *Note that comments identified in blue text come directly from APPA and/or LPPC comments.*

The proposed CIP-005-6 uses the term, "vendor." The definition of vendor is not a NERC defined term. Seattle City Light believes the SDT should provide guidance regarding the use of the term "vendor." If "Vendor" is not defined by NERC, the Guidance should recommend that Entities include their definition of "vendor" in their plan(s).

Seattle agrees with R2 Part 2.4 but requests clarification of the term "determining."

Seattle generally agrees with Proposed R2 Part 2.5 but requests revisions to the Rationale for R2. The last sentence of paragraph 2 of the rationale states the objective "is for entities to have the ability to rapidly disable active remote access sessions…" The Responsible Entity may not have the capability to disable access during an "active" remote access session. Seattle requests changing the language to "upon detected unauthorized activity."

Guideline & Technical Basis (GTB) for R2 should be included in this revision. Supplemental materials may be out of date – see page 21 of 24 in the posted redline version. Please Include reference to FERC Order 829 for parts 2.4 and 2.5.

The SDT should consider adding a CIP Exceptional Circumstance clause to R2 parts 2.4 and 2.5

3. The SDT developed proposed CIP-010-3 Requirement R1 Part 1.6 to address the Order No. 829 directive for entities to address verification of software integrity and authenticity in the BES Cyber System environment (P 48). The SDT followed an approach recommended by stakeholders during the initial posting of CIP-013-1. Do you agree with proposed revisions in CIP-010-3? If you do not agree, or if you agree but have comments or suggestions for the proposed requirement, please provide your recommendation and explanation.

☒ Yes

☐ No

Comments: *Note that comments identified in blue text come directly from APPA and/or LPPC comments.*

Seattle City Light agrees this requirement belongs in CIP-010 R1. Seattle generally agrees with Proposed R1 Part 1.6, but request the following items be addressed by the SDT:

- Seattle recommends the Guidelines and Technical Basis section is updated to reflect current information.
  - The requirement states "For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5…," indicating the authenticity and integrity of the specified parts need to be verified each time there is a change to a baseline for those parts. The proposed requirement would possibly involve entities duplicating effort for every case for which such

verification had to be undertaken (i.e., in the cases of multiple installations of software across many applicable Cyber Assets). This does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection. We believe that the existing statement in the GTB provides clarity on this issue and request that it not be removed. From the GTB: "It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches."

  - Seattle also recommends the language of the requirement be re-worded to reflect the intent of the GTB, as an auditor audits to the requirement, not the GTB. Doing a verification of authenticity and integrity for each change to the baseline for the specified parts would be tedious and require entities to acquire additional resources to perform the work.

- There is no guidance on how to verify the identity (authenticity). Performing this verification could be difficult if the software/patch comes from a third-party tool. Guidance on how this can be done needs to be made available to entities in order to perform an evaluation of the work and resources involved to achieve this requirement. Hashing was given as an example during an industry webinar, but this is not realistic for each type of system.
- Additional examples of acceptable measures should to be listed, in particular for R1.6.1 and R1.6.2. Additionally, Seattle requests examples of acceptable evidence when there is not a method available to verify the identity of the software source.
- While Seattle supports these changes, clarification is required about how new R1.6 applies to entirely new BES Cyber Systems (BCS), i.e., BCS that are newly implemented, have not previously had a baseline, and thus do not have an existing baseline for a change to deviate from. We expect that R1.6 is intended to apply to new BCS as well as to existing BCS, but as written the requirement does not. Please clarify to avoid implementation confusion and minimize audit challenges.

4. The SDT removed low-impact BES Cyber Systems from the applicability in CIP-013-1 and is not proposing any new requirements for these cyber systems. The SDT believes that the proposed applicability to high and medium impact BES Cyber Systems appropriately focuses industry resources on supply chain cyber security risk management for industrial control system hardware, software, and computing and networking services associated with BES operations, as specified in Order No. 829. Do you agree with the SDT's removal of low impact BES Cyber Systems from CIP-013-1? If you do not agree, or if you agree but have comments or suggestions, please provide your recommendation and explanation.

☒ Yes

☐ No

Comments: Seattle City Light agrees with the removal of low-impact BES Cyber Systems from CIP-013-1 and agrees that the current standard as written appropriately addresses the Commission's concerns as specified in Order No. 829. Among other things, the Order requests a risk-based approach. Application of Standard CIP-002 is an established, Commission-approved approach to categorize a utility's BES Cyber Systems into high, medium, and low risk classifications. Application of this established risk-based approach to cyber asset procurement for electric utilities is natural, appropriate, and consistent with the guiding CIP philosophy, stated in Section 6 of each CIP Standard, that each Standard "exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems."

Furthermore, Seattle believes that for entities that have a mixture of High, Medium and Low assets, the Low assets would inherently benefit from the additional requirements of Medium and High requirements as a matter of normal business practices. Additionally, many Contracts and Master Agreements are developed for all products and services purchased from a vendor. For Entities that have Low assets only, there would not be additional requirements based on CIP-002 risk based approach, as appropriate to the low BES risk presented by these entities.

Seattle believes that including Lows will require substantial resources by each Responsible Entity to identify and maintain an inventory list of these items, beyond the benefit provided by additional controls. Existing controls inherent to CIP-003 and previous CIP Standards reduce the risk associated with Lows.

5. The SDT revised the Implementation Plan in response to stakeholder comments. Do you agree with the Implementation Plan for the requirements in Project 2016-03? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan, please provide your recommendation and explanation.

☒ Yes

☐ No

Comments: *Note that comments identified in blue text come directly from APPA and/or LPPC comments.*

Seattle City Light generally agrees with an 18-month implementation plan but, would prefer a 24-month implementation plan. Seattle feels that a 24-month timeframe is more appropriate and gives the entity additional time to align budgets and develop processes with vendors and suppliers.

Seattle, in line with our recommendation to move CIP-013 to a performance-based standard as discussed in Question 1 above, also recommends deleting discussion of contracts and contract dates from implementation guidance, and focusing the guidance on BES Cyber Assets procured subsequent to the implementation date of the standard. If performance-based principles are not adopted, Seattle at least asks for clarity to change this General Consideration from:

Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in the contract do not determine whether the contract is within scope of CIP-013-1.

To:

Supply Chain Risk Management plan must be used by appropriate procurement processes that begin on or after the implementation date. (Also make corresponding change to the associated note in CIP-013 R2.)

Further, Seattle requests clarification on if/when existing contracts, master contracts, or long-term maintenance agreements that may be re-opened for renegotiation or later put in use (e.g., a state master contract negotiated prior to the CIP-013 implementation date but not actually used by a utility until after CIP-013 implementation date), come into the scope of CIP-013. Seattle notes that shifting to a performance-based Standard, focused on specific vendor protections and not the means that such protections are achieved (i.e., contracts) would minimize the explanations required about such matters.

The Implementation Plan does not handle unplanned changes such as newly identified IROLs or registration changes, etc, that may bring an entity suddenly into scope for CIP-013, CIP-005 R2.4-2.5, and/or CIP-010 R1.6. Seattle therefore requests that the Implementation Plan be modified to

address, in a reasonable way, how entities come into compliance if, due to changes, they newly meet applicability at some time after the effective date of the standards.

6. The SDT revised the Violation Severity Levels (VSLs) for requirements in CIP-013-1, CIP-005-6, and CIP-010-3. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the proposed requirements? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs, please provide your recommendation and explanation.

☐ Yes

☒ No

Comments: *Note that comments identified in blue text come directly from APPA and/or LPPC comments.*

Seattle City Light agrees with the VRFs and VSLs for CIP-013. As discussed above under Question 1, Seattle requests that the term "elements" be included in CIP-013 R1.2 to clearly align with the VSLs for this requirement.

For CIP-010, Seattle does not find that the VSL covers failures to implement the process. It therefore does not include all possible combinations of violation. Consequently, we request that there be an identified severity level for failure to implement and lower severity levels when a single aspect of the requirements is missing.

For CIP-005, Seattle believes that the VRFs and VSLs should be updated to reflect the same general structure used in CIP-010. The VSL for CIP-005 results in a "Severe" penalty if the entity did not have a method to determine and did not have a method to disable. Seattle would prefer a "High" VSL penalty if the entity has a process to determine but does not have a process to disable, and vice-versa if the entity did not have a process to determine but does have a process to disable.

7. The SDT developed draft Implementation Guidance for CIP-013 to provide examples of how a Responsible Entity could comply with the requirements. The draft Implementation Guidance does not prescribe the only approach to compliance. Rather, it describes some approaches the SDT believes would be effective ways to comply with the standard. See NERC's Compliance Guidance policy for information on Implementation Guidance. Do you agree with the example approaches in the draft Implementation Guidance? If you do not agree, or if you agree but have comments or suggestions for the draft Implementation Guidance, please provide your recommendation and explanation.

☐ Yes

☒ No

Comments: *Note that comments identified in blue text come directly from APPA and/or LPPC comments.*

Seattle City Light generally agrees with the Implementation Guidance for CIP-013 and feels that this is a promising new approach but is uncertain if the approach best provides assurance and guidance about these new Standards in the absence of the "Guidance and Technical Basis" sections in each Standard and the intentional flexibility of CIP-013 in particular. Seattle is concerned about the possibilities that NERC and the Regions may withdraw previously-granted endorsement should FERC request revisions to the Standard. As such, Seattle would prefer to see the new "Implementation Guidance Document" supplemented with "Guidance and Technical Basis" sections in each Standard, including for CIP-005-6 R2.4 and R2.5 and for CIP-010-3 R1.6.

As discussed above, “vendor” is not a NERC defined term. The term “vendor” is also used in the proposed CIP-005. Seattle believes the SDT should provide guidance regarding the use of the term “vendor.” If “vendor” is not defined by NERC, the Guidance should recommend that entities include their definition of “vendor” in their plan(s).

Neither of the bullets for R3 in the Implementation Guidance sufficiently explain compliance needs because both bullets only deal with plan review and not approval, both of which are necessary for compliance. Therefore, Seattle recommends changing:

”Below are some examples of approaches to comply with this requirement:“

to

“Below is an example of an approach to comply with the review requirement required by: “

In addition, we recommend deleting the following guidance language from the second main bullet, because it is beyond the Requirement and introduced activities that are not explicitly required:

“Upon approval of changes to the supply chain cyber security risk management plan(s), the CIP Senior Manager or approved delegate should provide appropriate communications to the affected organizations or individuals. Additionally, communications or training material may be developed to ensure any organizational areas affected by revisions are informed.”

8. The SDT believes proposed CIP-013-1 and the draft Implementation Guidance provide entities with flexibility to meet the reliability objectives in a cost effective manner. Do you agree? If you do not agree, or if you agree but have suggestions for improvement to enable additional cost effective approaches, please provide your recommendation and, if appropriate, technical justification.

☒ Yes

☐ No

Comments: *Note that comments identified in blue text come directly from APPA and/or LPPC comments.*

Seattle City Light generally agrees that the entities can meet the reliability objectives in a cost effective manner for CIP-013-1 with two exceptions.

One exception is if that if, due to uncertainty, anticipated audit risk, an eventually established audit approach, or any other reason, Standard CIP-013 precludes or has a chilling effect on use of regional master contracts and piggyback agreements, then cyber asset procurement expenses will increase for municipal utilities, smaller entities and co-ops, and other publics with little or no benefit. Costs will increase for (i) the procurement process itself, because utilities will need to research specifications and develop contracts individually to replace pre-negotiated master agreements, and for (ii) each purchase, because aggregated buying power and large-purchase discounts will be lost. To minimize these risks, Seattle strongly urges that audit approach language for CIP-013 R2 be clarified in advance to clearly identify the acceptable use of master agreements rather than leave this determination up to individual regions, auditors, time, and chance.

The other exception is the implementation of CIP-005 R2.4 and R2.5 (methods to detect and disable remote access for vendors and vendor system) for existing BES Cyber Systems. Some legacy cyber systems are inherently structured and configured for vendor access, and reworking them to allow real-time detection and, especially, disabling of such access may prove extremely costly. At the same time, these changes may degrade the performance of these systems. Seattle suggests that the option for a Technical Feasibility Exception be allowed for legacy systems, or

alternatively that legacy systems be granted an extended implementation period of up to five or ten years (during which such systems likely would be replaced).

9. Provide any additional comments for the SDT to consider, if desired.

Comments: None

THE FOUNDATION FOR RESILIENT SOCIETIES COMMENTS AS FOLLOWS *ON PROPOSED STANDARD*

2016-03, CYBER SUPPLY CHAIN RISK MANAGEMENT, CIP-005-6, CIP-010-3, AND CIP-013-1:

Filed with NERC June 15, 2017

1. These NERC/SDT attempts to produce a CIP standard for supply chain vulnerabilities fall short in an extreme threat environment. Adversaries' efforts against the electric grid and other civil infrastructure show disdain for U.S. defenses and deep commitment to using Information Operations (including cyber warfare) against the nation. The Bulk Electric System (BES) is a major target—this motivates development of strong capabilities for cyberattack. Adversaries understand full well the dependencies of social and national security institutions and all other critical infrastructures on electric power.

2. There is insufficient substance to the draft standard, other than the usual CIP generalized statements of planning, implementation, and periodic reviews that provide *pro forma* response to FERC Order No. 829. In its 9-1 vote to reject the first draft, the industry sent a clear message to NERC and FERC: the standard requirements are, at present, inadequately defined and therefore the feasibility of cost recovery is hard to judge.

3. Any sincere attempt at compliance with the draft standard requirements by responsible entities will incur high costs with uncertain benefit to the survivability of the BES. The Standard Drafting Team appears to minimize the complexity of the 2014 Russian penetrations of the U.S. BES, its sophisticated multi-layered, years-earlier penetration of vendor's control systems, phishing efforts, firmware modifications, and extensive use of IT vendors' vulnerabilities in operating, communications and networking, and database systems. The draft lacks good protective steps on these vulnerabilities and is therefore inadequate for mitigating risk--especially given the increasing nature of the Russian Havex and BlackEnergy threats evidenced in the follow-on attacks in the Ukraine Grid in 2015 and 2016. Note the recent revelation by ESET and DRAGOS of CRASH OVERIDE malware (associated with the 2016 Ukraine attack) with specific and flexible targeting of "low impact" industrial control systems (ICS). Note also the increasing threat from Distributed Denial of Service (DDoS) IoT and ransomware attacks. To expect several thousand utilities to individually and separately determine self-protective actions under the draft standard is unrealistic. Economies of scale in protection are needed.

4. Exempting "Low Impact" cyber systems leaves vulnerabilities. Also, as Resilient Societies has pointed out on FERC dockets, the exclusion from CIP Standards for all communications and networks between "Electronic Security Perimeters," together with direct internet connectivity to many so-called "low impact" cyber assets, leaves literally thousands of unsecured channels for malware implantation.

5. Stringent application whitelisting/blacklisting and selective third party certification steps, in conjunction with a national deterrence policy, are needed to enhance the minimal-protection from current CIP standards.

6. Ambiguities in standard requirements result in a lack of auditability, as noted by many other commenters.
7. In the short-term, a more practical NERC initiative could be to support a FERC rulemaking to require Bulk Electric System-jurisdictional entities to detect, report, mitigate and remove malware. State PUCs should likewise support a malware mitigation initiative for distribution utilities.

William R. Harris

Foundation for Resilient Societies, Inc.

Additional comments received from Independent Electric System Operator

1. The SDT has revised requirements for developing and implementing supply chain cyber security risk management plans (CIP-013-1 Requirements R1 – R3) in response to stakeholder comments. Do you agree with the proposed requirements? If you do not agree, or if you agree but have comments or suggestions for the proposed requirements, please provide your recommendation and explanation.

☐ Yes

☒ No

Comments: The IESO agrees in principle with the proposed requirements and respectfully submit suggestions for purposes of clarity.

Requirement 1.2.1

We suggest the following wording change as the current wording suggests that the vendor has sufficient knowledge of the Responsible Entities' environment to know that a particular vulnerability does in fact pose a security risk to the Responsible Entity.

Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that *could* pose cyber security risk to the Responsible Entity;

Requirement 1.2.2

We suggest the following wording change as the current phrase "coordination of response" is not clear as to what is intended by "coordination".

Coordination of response *activities by the vendor and the Responsible Entity* to address vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

Requirement 1.2.3

We suggest the following wording change as the current wording suggests that the Vendor has sufficient knowledge of the Responsible Entity to determine whether or not an individual should no longer be granted access. The Responsible Entity is the only party to an agreement that has the ability to determine who should or should not have access.

Circumstances where vendors should notify the Responsible Entity that access requirements of the vendor or third party personnel has changed.

Requirement 1.2.4

We suggest the following wording change as the current wording is not clear as to which vulnerabilities are applicable.

Disclosure by vendors of known vulnerabilities *in the procured product or service;*

Requirement 1.2.6

We suggest the following wording change as the use of the phrase “Coordination of controls” is confusing.

Controls for; (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s).

2. The SDT developed proposed CIP-005-6 Requirement R2 Parts 2.4 and 2.5 to address the Order No. 829 directives for controls on vendor-initiated remote access to BES Cyber Systems covering both user-initiated and machine-to-machine vendor remote access. The SDT followed an approach recommended by stakeholders during the initial posting of CIP-013-1. Do you agree with proposed revisions in CIP-005-6? If you do not agree, or if you agree but have comments or suggestions, please provide your recommendation and explanation.

☒ Yes

☐ No

Comments: The IESO agree with the new CIP-005-6 Requirement R2 Parts 2.4 and 2.5 however we note there is no corresponding “Guidance and Technical Basis” or “Rationale”

3. The SDT developed proposed CIP-010-3 Requirement R1 Part 1.6 to address the Order No. 829 directive for entities to address verification of software integrity and authenticity in the BES Cyber System environment (P 48). The SDT followed an approach recommended by stakeholders during the initial posting of CIP-013-1. Do you agree with proposed revisions in CIP-010-3? If you do not agree, or if you agree but have comments or suggestions for the proposed requirement, please provide your recommendation and explanation.

☐ Yes

☒ No

Comments: The IESO is concerned with two aspects of CIP-010-3 Requirement R1 Part 1.6:

1. The phrase “when the method to do so is available to the Responsible Entity from the software source” will be difficult to audit and difficult for the Responsible Entity to confirm as it is hard to prove a negative. The IESO suggest that verification of software source and integrity can take many different forms and is a sufficiently common practice that this phrase is not required. To take into consideration legacy software, the IESO suggest the wording be adjusted, to reflect FERC intentions that the requirements are forward looking, by replacing the phrase “and when the method to do so is available to the Responsible Entity from the software source” with “and, at a minimum, for the portion of the software that has changed:”

2. There appears to be inconsistency between the requirement and the Guidelines.

The requirement states “For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5”.

The Guidelines and Technical Basis section heading Software and Authenticity, paragraph three on page 39, states: “It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches.”

The requirement wording suggests it applies for any change but the guidance suggests that for some changes, such as patches, it would not apply. As the requirement is auditable and the guidance is not, the guidance becomes superfluous. The Guideline also introduces significant ambiguity that is impossible to audit.

Therefor the IESO suggest that either the requirement wording be adjusted to allow for automated patching solutions or the Guideline be removed as it is contradictory. The IESO suggest that automated patch deployment solutions should be able to verify the identity and integrity of the patch. Therefore the best solution is to remove the guideline.

4. The SDT removed low-impact BES Cyber Systems from the applicability in CIP-013-1 and is not proposing any new requirements for these cyber systems. The SDT believes that the proposed applicability to high and medium impact BES Cyber Systems appropriately focuses industry resources on supply chain cyber security risk management for industrial control system hardware, software, and computing and networking services associated with BES operations, as specified in Order No. 829. Do you agree with the SDT’s removal of low impact BES Cyber Systems from CIP-013-1? If you do not agree, or if you agree but have comments or suggestions, please provide your recommendation and explanation.

☐ Yes

☐ No

Comments: As the IESO does not have any low impact BES Cyber Systems we abstain from answering Yes or No to this question. However, we suggest the rationale for not including Low Impact Bes Cyber Systems is not clear. We also suggest that small to medium sized Responsible Entities have the most to gain from CIP-013 as they have the fewest resources to mitigate risks from the supply chain.

While the IIESO does not have Low Impact Bes Cyber Systems we have multiple interfaces with our Market Participants that do have Low Impact BES Cyber Systems. This, in turn represents, risk to our BES Cyber Systems. As such we recommend that CIP-013-1 apply to Low Impact BES Cyber Systems to reduce the supply chain risk not only to the Low Impact BES Cyber Systems but to the IRC member organization’s BES Cyber Systems.

5. The SDT revised the Implementation Plan in response to stakeholder comments. Do you agree with the Implementation Plan for the requirements in Project 2016-03? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan, please provide your recommendation and explanation.

☒ Yes

☐ No

Comments:

6. The SDT revised the Violation Severity Levels (VSLs) for requirements in CIP-013-1, CIP-005-6, and CIP-010-3. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the proposed requirements? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs, please provide your recommendation and explanation.

☒ Yes

☐ No

Comments:

7. The SDT developed draft Implementation Guidance for CIP-013 to provide examples of how a Responsible Entity could comply with the requirements. The draft Implementation Guidance does not prescribe the only approach to compliance. Rather, it describes some approaches the SDT believes would be effective ways to comply with the standard. See NERC's Compliance Guidance policy for information on Implementation Guidance. Do you agree with the example approaches in the draft Implementation Guidance? If you do not agree, or if you agree but have comments or suggestions for the draft Implementation Guidance, please provide your recommendation and explanation.

☒ Yes

☐ No

Comments: Note: the following comment is the same as identified for question 3.

8. The SDT believes proposed CIP-013-1 and the draft Implementation Guidance provide entities with flexibility to meet the reliability objectives in a cost effective manner. Do you agree? If you do not agree, or if you agree but have suggestions for improvement to enable additional cost effective approaches, please provide your recommendation and, if appropriate, technical justification.

☒ Yes

☐ No

Comments:

9. Provide any additional comments for the SDT to consider, if desired.

Comments:

There appears to be inconsistency between the requirement and the Guidelines in CIP-010 R1.

The requirement states "For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5".

The Guidelines and Technical Basis section heading Software and Authenticity, paragraph three on page 39, states: “It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches.”

The requirement wording suggests it applies for any change but the guidance suggests that for some changes, such as patches, it would not apply. As the requirement is auditable and the guidance is not, the guidance becomes superfluous. The Guideline also introduces significant ambiguity that is impossible to audit.

Therefor the IESO suggest that either the requirement wording be adjusted to allow for automated patching solutions or the Guideline be removed as it is contradictory. The IESO suggest that automated patch deployment solutions should be able to verify the identity and integrity of the patch. Therefore the best solution is to remove the guideline.

Note: the following comment is the same as identified for question 2.

We note there is no corresponding “Guidance and Technical Basis” or “Rationale” for CIP-005-6 Requirement R2 Parts 2.4 and 2.5.

Project Name:	2016-03 Cyber Security Supply Chain Risk Management | CIP-005-6, CIP-010-3, CIP-013-1
Comment Period Start Date:	5/2/2017
Comment Period End Date:	6/15/2017
Associated Ballots:	2016-03 Cyber Security Supply Chain Risk Management CIP-005-6 IN 1 ST 2016-03 Cyber Security Supply Chain Risk Management CIP-010-3 IN 1 ST 2016-03 Cyber Security Supply Chain Risk Management CIP-013-1 AB 2 ST

There were 101 sets of responses, including comments from approximately 220 different people from approximately 141 companies representing 10 of the Industry Segments as shown in the table on the following pages.

The Project 2016-03 Standards Drafting Team (SDT) appreciates the careful review and constructive feedback from stakeholders. The SDT made clarifying and non-substantive changes suggested by stakeholders to the proposed Reliability Standards as follows:

CIP-013-1

- Clarified wording in Requirement R1 Part 1.2.4 for consistency
- Revised examples of procurement processes listed in Requirement R1 rationale to include cooperative purchase agreements
- Clarified in Requirement R3 rationale that responsible entities are not required to renegotiate contracts when implementing updated plans
- Revised the Violation Severity Level (VSL) for Requirement R2 to describe four levels (Lower, Moderate, High, and Severe)

CIP-005-6

- Revised rationale to clarify that responsible entities do not need to implement remote access management processes if they do not allow remote access to applicable BES Cyber Systems, consistent with approved CIP-005-5
- Clarified in the rationale that the phrase *vendor remote access sessions (including Interactive Remote Access and system-to-system remote access)* used in the Requirement covers all remote access sessions with vendors.
- Revised VSL for Requirement R2 to include an additional level (High)

CIP-010-3

- Clarified in Requirement R1 Part 1.6 that responsible entities are required to perform software verifications **prior to** a change in baseline
- Revised the Measure for Part 1.6 to include evidence that could apply to automated update systems
- Added information to the Guidelines and Technical Basis section for Requirement R1

Implementation Plan

- Revised examples of procurement processes listed in General Considerations to include cooperative purchase agreements
- Adopted clearer wording for General Considerations section as recommended by commenters
- Added statement to affirm applicability to high and medium impact BES Cyber Systems only
- Included implementation provisions for planned and unplanned changes in categorization consistent with Version 5 CIP Standards implementation

Responses to all comments are provided in the following sections.
All comments submitted can be reviewed in their original format on the project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Director of Standards Development, Steve Noess (via email) or at (404) 446-9691.

Questions

1. The SDT has revised requirements for developing and implementing supply chain cyber security risk management plans (CIP-013-1 Requirements R1 – R3) in response to stakeholder comments. Do you agree with the proposed requirements? If you do not agree, or if you agree but have comments or suggestions for the proposed requirements, please provide your recommendation and explanation.

2. The SDT developed proposed CIP-005-6 Requirement R2 Parts 2.4 and 2.5 to address the Order No. 829 directives for controls on vendor-initiated remote access to BES Cyber Systems covering both user-initiated and machine-to-machine vendor remote access. The SDT followed an approach recommended by stakeholders during the initial posting of CIP-013-1. Do you agree with proposed revisions in CIP-005-6? If you do not agree, or if you agree but have comments or suggestions, please provide your recommendation and explanation.

3. The SDT developed proposed CIP-010-3 Requirement R1 Part 1.6 to address the Order No. 829 directive for entities to address verification of software integrity and authenticity in the BES Cyber System environment (P 48). The SDT followed an approach recommended by stakeholders during the initial posting of CIP-013-1. Do you agree with proposed revisions in CIP-010-3? If you do not agree, or if you agree but have comments or suggestions for the proposed requirement, please provide your recommendation and explanation.

4. The SDT removed low-impact BES Cyber Systems from the applicability in CIP-013-1 and is not proposing any new requirements for these cyber systems. The SDT believes that the proposed applicability to high and medium impact BES Cyber Systems appropriately focuses industry resources on supply chain cyber security risk management for industrial control system hardware, software, and computing and networking services associated with BES operations, as specified in Order No. 829. Do you agree with the SDT's removal of low impact BES Cyber Systems from CIP-013-1? If you do not agree, or if you agree but have comments or suggestions, please provide your recommendation and explanation.

5. The SDT revised the Implementation Plan in response to stakeholder comments. Do you agree with the Implementation Plan for the requirements in Project 2016-03? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan, please provide your recommendation and explanation.

6. The SDT revised the Violation Severity Levels (VSLs) for requirements in CIP-013-1, CIP-005-6, and CIP-010-3. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the proposed requirements? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs, please provide your recommendation and explanation.

7. The SDT developed draft Implementation Guidance for CIP-013 to provide examples of how a Responsible Entity could comply with the requirements. The draft Implementation Guidance does not prescribe the only approach to compliance. Rather, it describes some approaches the SDT believes would be effective ways to comply with the standard. See NERC's Compliance Guidance policy for information on Implementation Guidance. Do you agree with the example approaches in the draft Implementation Guidance? If you do not agree, or if you agree but have comments or suggestions for the draft Implementation Guidance, please provide your recommendation and explanation.

8. The SDT believes proposed CIP-013-1 and the draft Implementation Guidance provide entities with flexibility to meet the reliability objectives in a cost effective manner. Do you agree? If you do not agree, or if you agree but have suggestions for improvement to enable additional cost effective approaches, please provide your recommendation and, if appropriate, technical justification.

9. Provide any additional comments for the SDT to consider, if desired.

1. The SDT has revised requirements for developing and implementing supply chain cyber security risk management plans (CIP-013-1 Requirements R1 – R3) in response to stakeholder comments. Do you agree with the proposed requirements? If you do not agree, or if you agree but have comments or suggestions for the proposed requirements, please provide your recommendation and explanation.	
Aaron Cavanaugh - Bonneville Power Administration - 1,3,5,6 - WECC

BPA disagrees with the language in Requirement R3 requiring the CIP Senior Manager or delegate approve the supply chain cyber security risk management plans. Other CIP standards, such as CIP-003-6, Requirement R1, require CIP Senior Manager approval of "policies," not "plans." In Order No. 829, the Federal Energy Regulatory Commission stated, "*Consistent with or similar to the requirement in Reliability Standard CIP-003-6, Requirement R1*, the Reliability Standard should require the responsible entity's CIP Senior Manager to review and approve the controls adopted to meet the specific security objectives identified in the Reliability Standard at least every 15 months." Order No. 829 at P46 (emphasis added). Requiring CIP Senior Manager approval of plans is not consistent or similar to requiring approval of policies because plans are more tactical and numerous than policies. CIP Senior Manager approval should apply only to overarching strategic documents, and not to approval of highly detailed plans for implementation of processes. Instead, CIP-013 should be added to the list of policies requiring CIP Senior Manager approval in CIP-003-6, Requirement R1.	
Likes 0	
Dislikes 0	
Response. Thank you for your comment. Requirement R3 addresses the Order No. 829 directive for requiring CIP Senior Manager review and approval of the plan. (P. 46). The SDT believes it is appropriate to allow entities to have flexibility in determining whether the CIP Senior Manager or delegate should review and approve the plan. CIP-003-6 provides for policy review by CIP Senior Manager only.	
Gregory Campoli - New York Independent System Operator - 2

Recommend removing those items covered in CIP-005 and CIP-010 from CIP-013. There are substantive requirements being incorporated into CIP standards to perform functions for all BES Cyber Systems (to the extent possible), it is not clear there is a remaining need to for a separate standard requiring that those items be addressed during the procurement process. This appears to apply to software source and identity verification (now required "when the method to do so is available" by CIP-010) and determining active vendor remote access sessions (now required by CIP-005). Having a standard that requires you to perform the underlying function and also to take those functions into account during the procurement process is needless duplication that does not increase security or reliability and could result in compliance "double jeopardy." The Compliance and/or Implementation Guidance should make clear that, as long as evidence demonstrates that all items expressly identified in CIP-013, R1 are contained in a Supply Chain Cyber Security Management Plan or Plans, and are implemented pursuant to R2, entities will not be found out of compliance. More specifically, entities should not be subjected to CIP-013 noncompliance findings resulting from a difference of opinion concerning security adequacy

Response. Thank you for your comment. Requirement R1 Parts 1.2.5 and 1.2.6 address procurement processes related to software verification and vendor remote access, respectively. The proposed requirements in CIP-010-3 and CIP-005-6 are operational in nature and not related to procurement. Therefore the CIP-013 requirements are not duplicative of the CIP-010-3 and CIP-005-6 requirements. The SDT believes both operational controls and procurement related processes provide reliability benefit and are needed to address the directives in Order No. 829. The SDT is addressing the concern with potentially varying compliance interpretations by developing Implementation Guidance. The ERO Enterprise has endorsed the CIP-013-1 Implementation Guidance in accordance with NERC's Compliance Guidance policy. The ERO Enterprise's endorsement of the Implementation Guidance examples means the ERO Enterprise CMEP staff will give these examples deference when conducting compliance monitoring activities. As stated in the compliance guidance policy, "Registered entities can rely	

upon the example and be reasonably assured that compliance requirements will be met with the understanding that compliance determinations depend on facts, circumstances, and system configurations."

GRE supports the NRECA comments. In R1, NRECA recommends that the SDT reiterate "high and medium impact" each time BES Cyber System is used in the requirement parts. (This would be added to part 1.1, 1.2, and 1.2.5.) We also question why 1.2.1 and 1.2.2 is specific to "products or services provided to the Responsible Entity," but 1.2.4 is not. We recommend adding this phrase to 1.2.4: "Disclosure by vendors of known vulnerabilities related to products or services provided to the Responsible Entity." Further, we recommend further clarification to the term "vendor." We recommend explaining this term in the Guidelines and Technical Basis (GTB) section rather than the Rationale. The intent of the term "vendor" is not a Rationale for the standard. Additionally, there are a number of potential vendor scenarios which should be clarified in the GTB. The vendor explanation excludes other NERC Registered Entities, but it is not clear whether this exclusion also applies to other utilities not registered with NERC. It is also not clear whether the term vendor is intended to apply to contract employees, particularly those who may be using company issued computer equipment and receiving company developed security training. It would seem that the Transient Cyber Asset requirements already sufficiently mitigate this risk and additional requirements are not necessary. We also find that the term "system integrators" is not well understood and request further clarification.

Response. Thank you for your comment.	

The main body text in Requirement R1 establishes applicability to high and medium impact BES Cyber Systems; the SDT believes repeating this applicability in the requirement parts is redundant. The SDT agrees that Part 1.2.4 should be clarified to apply to 'products or services provided to the Responsible Entity' and has added this clarification Part 1.2.4 in Draft 3 of proposed CIP-013-1.

The SDT believes the description of *vendor* in the Rationale section gives clarity to the CIP-013 requirements without limiting flexibility needed by responsible entities for developing and implementing cyber security risk management plans that meet the entity's procurement and cyber security needs. This description and all information in the rationale sections remain with the standards in the supplemental material section to inform Responsible Entities, compliance, and enforcement staffs. Requirement R1 Part 1.2 pertains to procuring BES Cyber Systems, which the SDT does not believe would entail staff augmentation contractors. Responsible entities should consider entity-specific circumstances related to staff augmentation contractors or procurement of products or services from non-NERC utility in developing their plan.

Comments:

Concerned that the R1 guidance provides details which are beyond the scope of R1

Request re-wording of R1 Part 1.2.1 and 1.2.4 to easily understand what is expected. These Parts appear to be duplicative. Guidance does not adequately distinguish between the Parts. One interpretation is that Part 1.2.1 is for products/services and that Part 1.2.4 is for vulnerabilities in the product. It is not clear if these Parts expect information sharing at the time of procurement or on-going?

In R1 Parts 1.2.1 and 1.2.2, the term “vendor-identified incident” is unclear. It could mean incidents that were identified by another party, specific to the products of a specific vendor. It could mean only incidents identified by the vendor. Suggest changing “identified to “acknowledged” or “confirmed.”

Definition of vendor is not a NERC defined term. The term “vendor” is also used in the proposed CIP-005.

Request more guidance for the term “vendor” and use cases. Guidance should prompt Entities to include their definition of “vendor” in their plan(s).

Recommend removing those items (CIP-013 R1 subparts 1.2.5 and 1.2.6) covered in CIP-005 and CIP-010 from CIP-013. There are substantive requirements being incorporated into CIP standards to perform functions for all BES Cyber Systems (to the extent possible), it is not clear there is a remaining need to for a separate standard requiring that those items be addressed during the procurement process. This appears to apply to software source and identity verification (now required “when the method to do so is available” by CIP-010) and determining active vendor remote access sessions (now required by CIP-005). Having a standard that requires you to perform the underlying function and also to take those functions into account during the procurement process is needless duplication that does not increase security or reliability and could result in compliance “double jeopardy.”

The Compliance and/or Implementation Guidance should make clear that, as long as evidence demonstrates that all items expressly identified in CIP-013, R1 are contained in a Supply Chain Cyber Security Management Plan or Plans, and are implemented pursuant to R2, entities will not be found out of compliance. More specifically, entities should not be subjected to CIP-013 noncompliance findings resulting from a difference of opinion concerning security adequacy.

Is there an expectation of the vendor to disclose non-public information in 1.2.4? Is this only during contracting or is there an expectation of new vulnerabilities to be disclosed?

{C}1.1 – Delete “planning for”. Or if the use of “planning for” in R1 creates a necessary distinction between 1.1 and 1.2, what is it?

- What is implied by *(ii) transitions from one vendor(s) to another vendor(s)*? Why is this distinction necessary? Wouldn’t a vendor transition require a new contract? Does this refer to the act of severing existing remote access permissions? Subcontracting?

-

- R1.2.2: "Coordination of responses to vendor-identified incidents….", it is not clear who should be doing the coordinating and why this is necessary. Suggest deleting.

Response. Thank you for your comments.

The SDT has provided examples of processes related to Part 1.2.1 through 1.2.6 in the Implementation Guidance. A responsible entity may provide any additional clarity that the responsible entity believes is needed in its supply chain cyber security risk management plan.

The SDT believes the description of *vendor* in the Rationale section gives clarity to the CIP-013 requirements without limiting flexibility needed by responsible entities for developing and implementing cyber security risk management plans that meet the entity's procurement and cyber security needs. This description and all information in the rationale sections remain with the standards in the supplemental material section to inform Responsible Entities, compliance, and enforcement staffs. The SDT agrees that some responsible entities may need to provide additional entity-specific clarifications in their cyber security risk management plans.

Requirement R1 Parts 1.2.5 and 1.2.6 address procurement processes related to software verification and vendor remote access, respectively. The proposed requirements in CIP-010-3 and CIP-005-6 are operational in nature and not related to procurement. Therefore the CIP-013 requirements are not duplicative of the CIP-010-3 and CIP-005-6 requirements. The SDT believes both operational controls and procurement related processes provide reliability benefit and are needed to address the directives in Order No. 829.

The SDT is addressing the concern with potentially varying compliance interpretations by developing Implementation Guidance. The ERO Enterprise has endorsed the CIP-013-1 Implementation Guidance in accordance with NERC's Compliance Guidance policy. The ERO Enterprise's endorsement of the Implementation Guidance examples means the ERO Enterprise CMEP staff will give these examples deference when conducting compliance monitoring activities. As stated in the compliance guidance policy, "Registered entities can rely upon the example and be reasonably assured that compliance requirements will be met with the understanding that compliance determinations depend on facts, circumstances, and system configurations."

Part 1.1 and Part 1.2 address distinct directives from Order No. 829 pertaining to planning and procurement, respectively. (see Rationale and Order No. 829 P. 56 and P.59). Examples of processes or activities that could address the objectives for both are contained in the Implementation Guidance. Per Part 1.1, responsible entities must have process(es) that they use when planning for procurement of BES Cyber Systems to consider cyber security risks to the BES that could arise from transitions from one vendor to another vendor. The intent is for the responsible entity to consider cyber security risks that may result from the change in vendor, which may inform the entity's procurement process.

Texas RE notes that the proposed standard is not responsive to the FERC directive. FERC Order No. 829 P. 59 specifically states "The new or modified Reliability Standard must address the provision and verification of relevant security concepts *in future contracts* for industrial control system hardware, software, and computing and networking services associated with bulk electric system operations." The Note in Requirement R2, however, states: "Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual *terms and conditions of a procurement contract*; and (2) vendor performance and adherence to a contract." Texas RE agrees that it is unreasonable to hold a registered entity accountable for a vendor's adherence to (or lack of adherence to) a contract. Texas RE agrees as the standard drafting team (SDT) claims obtaining specific controls in the negotiated contract may not be feasible at all times but Texas RE believes this is *best practice*. In fact, in most cases contracts for these types of systems typically include security provisions and set similar expectations as described in the standard. The proposed standards would prohibit the compliance monitor from verifying the registered entity implemented part 1.1 and sub-parts 1.2.1 through 1.2.7. Moreover, this verification is to ensure that the registered entities' plans are consistent with the contract's expectations and obligations of the parties.

Admittedly, there will be circumstances in which a contracts may not be consistent or silent as it pertains to the responsible entity's security management plans (e.g. existing contacts or contracts in which the responsible entity was unable to negotiate the appropriate terms into the contract.) In those circumstances, other evidence should be provided demonstrating that the responsible entity has processes to ensure the vendor is expected/obligated to act consistently with the responsible entity's cyber security risk management

plans as it relates to the vendor's products or services. Therefore, the contracts should remain in scope as to demonstrate the mapping of expectations from the plan to the contract as far as vendor interactions for those specific items included in the standard and to advance best practices leading to a more reliable BES.

Additionally, Texas RE has the following concerns:

- In the current CIP-013-1 version, the SDT elected to restrict the scope of the Supply Chain process to Medium and High Impact Bulk Electric System (BES) Cyber Systems, as well as exclude Physical Access Controls (PACS), Electronic Access Control and Monitoring Systems (EACMS), and Protected Cyber Assets (PCAs) from the scope of the Standard. In doing so, the SDT appeared to rely on a number of commenters that suggested that FERC Order No. 829, P. 59 excluded these types of devices. Specifically, these commenters pointed to the following language in the FERC Order: "The new or modified Reliability Standard must address the provision and verification of relevant security concepts in future contracts for industrial control system hardware, software, and computing and networking services associated with bulk electric system operations." FERC Order No. 829, P. 59. Accordingly, it appears that the SDT has concluded that PACS, EACMS, and PCAs collectively do not fall within the scope of "industrial control system hardware" or "computing and networking services associated with bulk electric system operations."

  Texas RE is concerned PACS, EACMS, and PCAs *do* fall within the scope of "industrial control system hardware" and "computing and networking services associated with bulk electric system operations" as those terms are used in FERC Order No. 829. PACS, EACMS, and PCAs are foundational equipment within a network's architecture. Moreover, these devices are vendor supported and exposed to the precise vulnerabilities identified in FERC's supply chain directive. Given these facts, Texas RE does not believe there is either a basis in FERC Order No. 829 or, more importantly, a reliability-based rationale for excluding them from the scope of CIP-013-1.

- Page 7, Part 1.1: While FERC Order No. 829 specifically uses the term "hardware", Texas RE notes the word "hardware" is not used in the standard language. Texas RE recommends replacing the word equipment with the term hardware in order to be consistent with the FERC Order.

- Page 8, Section 1.2.6: Texas RE recommends the SDT define or provide examples of the term "*system-to-system remote access*" as this is a broad term which can be interpreted in many different ways.

Response. Thank you for your comment. The SDT believes proposed CIP-013-1 meets the reliability objectives contained in the project SAR and Order No. 829. The intent is for responsible entities to accomplish the objective by including the security topics contained in Requirement R1 Parts 1.2.1 – 1.2.6 in the entity's procurement processes, such as RFP or vendor negotiations. Evidence could include RFPs or other procurement correspondence that demonstrate the responsible entity's cyber security risk management concepts and controls. Consistent with the Order, the standard obligates responsible entities to address supply chain cyber security risk management without "directly impos[ing] obligations on suppliers, vendors or other entities that provide products or services to responsible entities" (P. 21). The note in Requirement R2 excludes contracts because the responsible entity may not be able to obtain all security provisions in Parts 1.2.1 – 1.2.6 with all vendors since the requirements cannot 'directly impose obligations on suppliers, vendors, or other entities".

The SDT believes that requiring entities to implement supply chain cyber security risk management plans for BES Cyber Systems provides the intended reliability benefit, which applies to "industrial control system hardware, software, and services associated with bulk electric system operations" as specified in Order No. 829 (P. 43). The SDT believes entities should have flexibility to determine supply chain cyber security risk management controls for other cyber assets, including EACMS, PACS, and PCAs. The SDT believes this is an appropriate risk-based approach that allows entities to focus resources where they provide the most reliability benefit. Although EACMS, PACS, and PCA do not fall within the scope of the proposed CIP-013-1 requirements, an entity may decide to use some of the supply chain cyber security risk management controls, processes, and procedures in planning and procuring for these assets as are used for applicable high and medium impact BES Cyber System.

The SDT does not believe changing 'equipment' to 'hardware' in the proposed standard will provide additional clarity.

Requirement R1 Part 1.6 addresses controls for all remote access with vendors. Because Interactive Remote Access as defined in the NERC glossary is limited to "user-initiated access by a person", the SDT included system-to-system remote access with a vendor(s) in the requirement to meet the directive in Order No. 829 (P. 45).

Chelan PUD appreciates the efforts of the drafting team to revise CIP-013 in response to comments and recommendations provided previously. Although there are significant improvements in this version of the Draft Standard, CHPD believes that the Standard should not be approved for the following reasons:

- Is not performance based and therefore not auditable
- Creates risk for the responsible entities due to lack of auditability
- Likely to be costly to vendors due to having to respond to various entity contract requests

CHPD has concerns about language related to procurement contracts, in particular use of master agreements, piggyback agreements, and evergreen agreements. To address these concerns and position CIP-013 as a performance based Standard, CHPD recommends that all references to “contracts” and most references to “procurement” be struck from CIP-013. However; the note in R2 should be maintained that states:

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

CHPD's reasoning is that there are means other than vendor contract negotiations, contract language, and procurement processes to address and achieve the protections required by R1.2. It is immaterial how these protections are achieved. Focusing thinking and audit approach on contracts and procurement (even if specific contract terms are not in scope) limits flexibility, is unnecessarily prescriptive, and does not reflect performance-based principles. As such CHPD asks that R1.2 be revised as follows:

1.2. *One or more process(es)* ***for its newly procured*** *BES Cyber Systems that address the following* ***elements****, as applicable:*

("new" meaning obtained after the implementation of CIP-013).

Note also that CHPD asks that the term "elements" be included in R1.2, as shown above, to clearly align with the VSLs for this requirement.

Associated guidance in the "Rationale for R1" and in the separate implementation guidance should be revised to reflect the change to a performance-based requirement in which contract terms and contract negotiations play no function in auditing. Contract terms might be used by an entity as evidence of performance, but there should be no expectation by audits in the Standard or implementation guidance that anything having to do with contracts or procurement processes is required. Ultimately, there should be no expectation that the protections be achieved solely through the procurement process. The objective is achieving each protection, not in how it is achieved.

The performance-based assessment requirements would be improved if worded in a way that allows the acceptance of any outcome reached by each Responsible Entity (e.g., "Each Responsible Entity shall and document the results of the assessment."). The intent should be to create a dialog between the entities and vendors on these topics rather than just documented within contractual language.

The SDT has revised the CIP-013-1 Rationale and the Implementation Plan to address commenter concerns with some types of contracts including multi-party contracts and master agreements. The SDT believes proposed CIP-013-1 provides entities with the necessary flexibility to develop its plan such that it will cover the procurement actions used by the responsible entity. The SDT does not agree with removing procurement-related objectives from the proposed standard, or removing the examples of procurement processes from the Implementation Guidance, as several FERC directives in Order No. 829 are directly related to procurement. The SDT has revised the VSL for Requirement R1 to remove the word *elements.* Proposed CIP-013-1 contains *risk-based* requirements to mitigate cyber security risks to the BES in the supply chain of BES Cyber Systems in accordance with the project SAR and Order No. 829. The standard addresses the relevant cyber security supply chain risks in the planning, acquisition, and deployment phases of the system life cycle for high and medium impact BES Cyber Systems. The SDT agrees that entities may be using other activities in other phases of the life cycle to also mitigate cyber security risks, and that some of these may be covered by other Reliability Standards.

Chelan PUD appreciates the efforts of the drafting team to revise CIP-013 in response to comments and recommendations provided previously. Although there are significant improvements in this version of the Draft Standard, CHPD believes that the Standard should not be approved for the following reasons: • Is not performance based and therefore not auditable	

- Creates risk for the responsible entities due to lack of auditability
- Likely to be costly to vendors due to having to respond to various entity contract requests

CHPD has concerns about language related to procurement contracts, in particular use of master agreements, piggyback agreements, and evergreen agreements. To address these concerns and position CIP-013 as a performance based Standard, CHPD recommends that all references to "contracts" and most references to "procurement" be struck from CIP-013. However; the note in R2 should be maintained that states:

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

CHPD's reasoning is that there are means other than vendor contract negotiations, contract language, and procurement processes to address and achieve the protections required by R1.2. It is immaterial how these protections are achieved. Focusing thinking and audit approach on contracts and procurement (even if specific contract terms are not in scope) limits flexibility, is unnecessarily prescriptive, and does not reflect performance-based principles. As such CHPD asks that R1.2 be revised as follows:

1.2. *One or more process(es)* ***for its newly procured*** *BES Cyber Systems that address the following* ***elements****, as applicable:*

("new" meaning obtained after the implementation of CIP-013).

Note also that CHPD asks that the term "elements" be included in R1.2, as shown above, to clearly align with the VSLs for this requirement.

Associated guidance in the "Rationale for R1" and in the separate implementation guidance should be revised to reflect the change to a performance-based requirement in which contract terms and contract negotiations play no function in auditing. Contract terms might be used by an entity as evidence of performance, but there should be no expectation by audits in the Standard or implementation guidance that anything having to do with contracts or procurement processes is required. Ultimately, there should be no expectation that the protections be achieved solely through the procurement process. The objective is achieving each protection, not in how it is achieved.

The performance-based assessment requirements would be improved if worded in a way that allows the acceptance of any outcome reached by each Responsible Entity (e.g., "Each Responsible Entity shall <insert performance activity> and document the results of the

assessment.”). The intent should be to create a dialog between the entities and vendors on these topics rather than just documented within contractual language.

In the Response to Comments the SDT asserts “Identifying and assessing cyber security risks in BES Cyber System planning. The SDT revised CIP-013-1 Requirement R1 Part 1.1 to “specify risks that Responsible Entities shall consider in planning for procurement of BES Cyber Systems“. Previously, commenters indicated that “the scope of cyber security risks being addressed in R1 is unclear**”**. The SDT removed unnecessary and unclear wording from Requirement R1s main requirement and revised Requirement R1 Part 1.1 to clarify the supply chain cyber security risks that must be addressed by the Responsible Entity in planning for the procurement of BES Cyber Systems.”

This change does not clearly identify the risks as previously noted by commenters.

Dominion recommends the following language change for CIP-013-1, R1 Part 1.1:

“Include one or more process(es) used in planning for the procurement of BES Cyber Systems to identify and assess, if applicable, the cyber security risk(s) of (i) procuring and installing vendor equipment and software; (ii) network architecture security; and (iii) transitions between vendor”

Dominion also recommends the following proposed language change for CIP-013-1 R1 Part 1.2:

“One or more process(es) used during procurement of BES Cyber Systems that address the following, as applicable:”

R3 needs to contain the caveat found in R2 that “[Revision] of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders).”

Response. Thank you for your comments.

The SDT believes the suggested addition of network architecture security to Part 1.1 is potentially unclear and could have a variety of interpretations by responsible entities. The SDT does not support the suggested change.

The SDT does not believe the suggested change from *in* to *during* for Part 1.2 provides additional clarity. Requirement R3 specifies that entities must review and obtain CIP Senior Manager approval of its plan. The SDT does not believe the note about implementation is appropriate for R3. The note in R2 applies to implementation of the entity's plan and is not limited to the initial plan only. If an entity revises its plan at a later date and implements the revised plan, it is not required to renegotiate or abrogate existing contracts as indicated by the note in R2.

The intent and purpose of CIP-013 is very dependent upon the Implementation Guidance document. We appreciate the hard work of the SDT to provide this document to industry and it has valuable information. A concern is that auditors can only audit to the requirements within the standard so some of the comments are based on needing more clarification within the standard itself. Language should be included in the standard (not just in the Rationale) that allows for inclusion of a clause in a procurement agreement stating that CIP-013 compliance must be met by the supplier unless it is either not offered or would significantly increase the cost of the agreement. (See CIP-013-1, Section B, Rationale for Requirement R1). This language in a procurement agreement, along with the supplier's stipulation that this compliance is either unavailable or will increase costs should constitute proof that CIP-013 compliance was considered by the Registered Entity but waived due to the supplier's inability to accommodate the requirement in a reasonable manner.	

The standard should make clear that, as long as evidence demonstrates that all items expressly identified in CIP-013, R1 are contained in a supply chain cyber security risk management plan or plans, and are implemented pursuant to R2, entities will not be found out of compliance. More specifically, entities should not be subjected to CIP-013 noncompliance findings resulting from a difference of opinion concerning security adequacy.

Santee Cooper is concerned about compliance obligations for procurement activities associated with multi-party wide-area contracts, master agreements and piggyback agreements. An exception, comparable to a CIP Exceptional Circumstance, should be included in the standard for these kinds of procurement activities.

This standard will create the need for entities to have an inventory tracking mechanism of products that are purchased under the supply chain risk management plan. For example, switches could be purchased for use in an IT department, not under the supply chain cyber security risk management plan, and this would preclude it from being used in a BES Cyber System. A CIP Exceptional circumstance or something similar should be added to the standard to allow an entity to use a piece of equipment not procured under the supply chain cyber security risk management plan rather than risk reliability of the BES.

Please add some wording to the requirement in the standard to address how far up the supply chain the plan applies to. If a laptop is purchased from a vendor is there an expectation that the cyber security risk management plan stop with that vendor or is there an expectation that the associated parts of the laptop fall under the plan? It's currently included in the rationale language but the rationale language cannot be audited.

What happens when a vendor is bought out by another vendor? Are you compliant until you have to negotiate a contract with the new vendor?

In R1 Parts 1.2.1 and 1.2.2, the term "vendor-identified incident" is unclear. It could mean incidents that were identified by another party, specific to the products of a specific vendor. It could mean only incidents identified by the vendor. Suggest changing "identified to "acknowledged" or "confirmed."

Response. Thank you for your comment.

The proposed CIP-013-1 requirements provide entities with flexibility to develop and implement an entity-specific cyber security supply chain risk management plan. The ERO Enterprise-endorsed Implementation Guidance provides examples of approaches to be compliant with the standard. As stated in NERC's approved Compliance Guidance Policy, "Registered entities can rely upon [the examples] and be reasonably assured that compliance requirements will be met."

Proposed CIP-013-1 does not preclude an entity from including a clause in a procurement agreement stating that CIP-013 compliance must be met by the supplier as suggested by the commenter. However, the SDT does not agree that this should be required by CIP-013 because it could negatively impact the procurement process for responsible entities. Furthermore, the SDT notes that the standard is not intended to impose obligations directly on the vendor. (P. 36)

The proposed requirements provide flexibility for entities to develop a plan that includes procurement processes for various types of procurement activities including multi-party wide-area contracts, master agreements and piggyback agreements. The SDT believes that an exception is not needed because of the flexibility provided in the requirements. The SDT has revised the rationale to include types of procurement activities listed by the commenter among the other examples. Some situations, such as when contracts are negotiated on behalf of the responsible entity, could be met by providing input to parties negotiating on behalf of the responsible entity.

Proposed CIP-013-1 address an entity's obligations to mitigate cyber security risks in planning and procuring high and medium impact BES Cyber Systems. An entity's inventory management, operating actions and management decisions to address emergency circumstances are not in scope of the standard. The SDT does not believe an exception such as CIP Exceptional Circumstances is needed to address equipment use. An entity could include provisions in its plan regarding procurement of products and services in emergency situations.

Procurement processes specified in Part 1.2 address various vendor-related cyber security topics. As noted in the Rationale section, the term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contract with to supply BES Cyber Systems and related services. The rationale section, including vendor description, becomes part of the guidelines section of the standard following board adoption. An entity can provide additional clarification of vendor relationships in its plan.

CIP-013 does not require an entity to renegotiate a contract when a vendor is bought by another vendor. However, if the entity negotiates a new contract after the effective date of CIP-013, that procurement process would fall under CIP-013.

Implementation Guidance provides examples of processes to address Parts 1.2.1 and 1.2.2 that provide additional clarity. A responsible entity can provide additional clarity if the responsible entity believes it is necessary in its cyber security supply chain risk management plan.

Recommend modifying CIP-007 and CIP-010 to include the proposed risk management elements proposed in CIP-013, or take the corresponding elements out of CIP-007 and CIP-010 to make CIP-013 more than just having a plan. There are no quantifiable measures in CIP-013 that really justify it as a stand-alone standard.	
Likes 0	
Dislikes 0	
Response. Thank you for your comment. Proposed CIP-013-1 contains risk-based requirements to mitigate cyber security risks to the BES in the supply chain of BES Cyber Systems in accordance with the project SAR and Order No. 829. The standard addresses the relevant cyber security supply chain risks in the planning, acquisition, and deployment phases of the system life cycle for high and medium impact BES Cyber Systems. The SDT does not believe additional clarity or efficiencies will be gained by introducing new requirements for BES Cyber System planning and procurement into CIP-007 or CIP-010.	
Anthony Jablonski - ReliabilityFirst - 10	
Answer	No

Comment	

Even though ReliabilityFirst believes the CIP-013-1 draft standard address directives from Federal Energy Regulatory Commission (FERC) Order No. 829 and is a positive step in addressing cyber supply chain management, ReliabilityFirst Abstains mainly due to Requirement R1 missing Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS), and Protected Cyber Assets (PCAs). ReliabilityFirst offers the following specific comments for consideration.

1. Requirement R1

    i. Even though Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS), and Protected Cyber Assets (PCAs) were not specifically called out specifically in FERC Order 829, ReliabilityFirst believes the SDT needs to examine the possible risk of not including EACMS, PACS and PCA as part of Requirement R1 and go beyond what was stated in FERC Order 829. EACMs and PACS are critical cyber assets that control access and monitoring into the entities' ESPs and PSPs and should follow the Supply Chain standard/requirements as do the High and Medium Impact Cyber Systems. As for the PCAs, if they are compromised due to a vulnerability in the vendors supplied hardware or software, they can possibly affect high and medium impact BES Cyber Systems. ReliabilityFirst offers the following modifications for consideration:

        a. Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber System and, [if applicable, associated Electronic Access Control and Monitoring (EACM), Physical Access Control Systems (PACS) and Protected Cyber Assets (PCA)]. The plan(s) shall include:

Likes 0	
Dislikes 0	

Response. The SDT believes that requiring entities to implement supply chain cyber security risk management plans for BES Cyber Systems provides the intended reliability benefit, which applies to "industrial control system hardware, software, and services associated with bulk electric system operations" as specified in Order No. 829 (P. 43). The SDT believes entities should have flexibility to determine supply chain cyber security risk management controls for other cyber assets, including EACMS, PACS, and PCAs. The SDT believes this is an appropriate risk-based approach that allows entities to focus resources where they provide the most reliability benefit. Although EACMS, PACS, and PCA do not fall within the scope of the proposed CIP-013-1 requirements, an entity may decide to use some of the supply chain

cyber security risk management controls, processes, and procedures in planning and procuring for these assets as are used for applicable high and medium impact BES Cyber System.	
Patricia Robertson - BC Hydro and Power Authority - 1, Group Name BC Hydro	
Answer	No
Document Name	
Comment	

- BC Hydro appreciates the direction of the revisions ie to remove enforcement actions against responsible entities that have limited ability to influence vendors. However, BC Hydro still believes some aspects of R1 will be difficult to manage / enforce, especially given the breadth of vendors many responsible entities have associated with their BCAs. Not all vendors are going to be able to accommodate the asks of the requirement.
- "Notification by the vendor…" suggests the vendor is expected to reach out to the responsible entity, and communication / transparency is endorsed through potential inclusion of terms in RFP's / contracts. This relies on the vendor honesty / transparency and there is no way to verify their attestations. The requirement focuses on entities reviewing vendor processes which may have limited impact on reliability.

Likes 0	
Dislikes 0	

Response. Thank you for your comment. The SDT believes responsible entities can meet the requirements of Part 1.2 and has provided some examples of ways to do so in the Implementation Guidance. The SDT agrees that responsible entities may not have the ability to obtain each of its desired cyber security controls in its contract with each of its vendors. The objective is to address the topics in Part 1.2 in the procurement process, with recognition that the actual terms and conditions of a contract are not in scope.

The SDT believes that engaging vendors to obtain notifications of relevant vulnerability and security issues can benefit reliability. For example, negotiations with vendors could lead to establishing designated points of contact for communicating issues. Responsible entities have flexibility to include entity-specific proposed terms and conditions in its plan.

Richard Kinas - Orlando Utilities Commission - 5	
Answer	No

Comment	
R1 states that each RE must have a plan with one or more processes that address ....as applicable. Applicability is in the eye-of-beholder, however the requirement does not specifically say as identified by the Responsibility Entity, which auditors may take as a deliberate act not to include, interpreting that it is not up to the Responsibilty Entity to determin which are applicable.	
Likes 0	
Dislikes 0	
Response. Thank you for your comment. In Part 1.2, 'as applicable' provides for situations where some of the topics do not apply to a given procurement action. For example, not all vendors will require remote access and therefore Part 1.2.3 and/or Part 1.2.6 do not apply.	
Alex Ybarra - Public Utility District No. 2 of Grant County, Washington - 5

Comment	
The clarification that we don't have and would like from NERC/WECC is the intent of the following statement in CIP-013 R1.2.5 ***"Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System".*** There is no Guidelines and technical basis at the end of the standard for this	

This has a very large implication as this says all software provided by a vendor has to perform an integrity and authenticity verification. This could implicate a dedicated channel from the vendor validating through software certificates which would imply entities forcing software vendors to provide this mechanism, which the likelihood of meeting this for MS, Symantec, (non-control system software) is slim. MD5 checksums can not validate the integrity of the software as this hashing mechanism was broken in 2005 (although a lot of software vendors still use it).	
Likes 0	
Dislikes 0	
Response. The objective of verifying software integrity and authenticity (Part 1.2.5) is to help ensure that software installed on BES Cyber Systems is not modified prior to installation without the awareness of the software supplier and is not counterfeit. Part 1.2.5 is not an operational requirement for entities to perform such verification; instead, it requires entities to address the software integrity and authenticity issue in its procurement processes (such as in Requests for Proposal, contract negotiations, or other procurement processes). Part 1.2.5 does not obligate the responsible entity to obtain, or the vendor to provide, the means for performing software verification. Factors such as competition, limited supply sources, expense, criticality of the product or service, and maturity of the vendor or product line could affect the terms and conditions ultimately negotiated by the parties and included in a contract. As a result, actual contract terms are not in scope for CIP-013.	
Wendy Center - U.S. Bureau of Reclamation - 5	
Answer	No
Document Name	
Comment	
Reclamation recommends the proposed standard differentiate between contractual and non-contractual purchases, such as commercial off-the-shelf (COTS) products or other purchases made without using a contract vehicle (e.g., credit card purchases or using repurposed equipment).	
Likes 0	

Dislikes 0	
Response. The proposed requirement provides flexibility for entities to distinguish cyber security risk management processes for various types of procurement activities in its plan. The SDT does not believe the standard should establish prescriptive requirements to differentiate. The SDT considers COTS procurements as a potential type of procurement to be addressed in the enity's plan.	
Tho Tran - Oncor Electric Delivery - 1 - Texas RE

Requirement R1.

Oncor agrees with the concept; however, Oncor believes the language for R1.1 should be revised as follows, *"(i) Responsible Entity procures and installs vendor equipment and software"*; and *"(ii) Responsible Entity transitions from one vendor(s) product or service to another vendor(s) product or service".*

For Requirement 1.2.1., the current wording suggests that the vendor has sufficient knowledge of Oncor's environment to know that a particular vulnerability does in fact pose a security risk to Oncor. We offer a recommendation on the language, *"Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that could pose cyber security risk to the Responsible Entity;"*

Requirement 1.2.2. The current phrase "coordination of response" is not clear as to what is intended by "coordination". We offer a recommendation on the language, *"Coordination of response activities by the vendor and the Responsible Entity to address vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;"*

Requirement 1.2.3. The current wording suggests that the vendor has sufficient knowledge of Oncor to determine whether or not an individual should no longer be granted access. Oncor is the only party to an agreement that has the ability to determine who should or

should not have access. We offer a recommendation on the language, *"Circumstances where vendors should notify the Responsible Entity that access requirements of the vendor or third party personnel has changed, based on CIP-004, R5."*

Requirement 1.2.4. The current wording is not clear as to which vulnerabilities are applicable. We offer a recommendation on the language, *"Disclosure by vendors of known vulnerabilities in the procured product or service that follows a responsible disclosure process";* Guidance should also be added to reference US-CERT, NIST, or other industry sources.

Requirement 1.2.6. Oncor suggests the following wording change as the use of the phrase "Coordination of controls" is confusing. We offer a recommendation on the language, *"Controls for; (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s)."*

Likes 0	
Dislikes 0	

Response. Thank you for your comments.

The SDT does not believe the suggested wording for Part 1.1 provides additional clarity.

The SDT intends for the Parts 1.2.1 – 1.2.6 to list topics that must be addressed in the responsible entity's procurement processes, and has avoided more prescriptive wording. Responsible entities may provide entity-specific details and clarifications in their supply chain cyber security risk management plans.

BPA disagrees with the language in Requirement R3 requiring the CIP Senior Manager or delegate approve the supply chain cyber security risk management plans. Other CIP standards, such as CIP-003-6, Requirement R1, require CIP Senior Manager approval of "policies," not

"plans." In Order No. 829, the Federal Energy Regulatory Commission stated, "*Consistent with or similar to the requirement in Reliability Standard CIP-003-6, Requirement R1*, the Reliability Standard should require the responsible entity's CIP Senior Manager to review and approve the controls adopted to meet the specific security objectives identified in the Reliability Standard at least every 15 months." Order No. 829 at P46 (emphasis added). Requiring CIP Senior Manager approval of plans is not consistent or similar to requiring approval of policies because plans are more tactical and numerous than policies. CIP Senior Manager approval should apply only to overarching strategic documents, and not to approval of highly detailed plans for implementation of processes. Instead, CIP-013 should be added to the list of policies requiring CIP Senior Manager approval in CIP-003-6, Requirement R1.

Response. Thank you for your comment. Requirement R3 addresses the Order No. 829 directive for requiring CIP Senior Manager review and approval of the plan. (P. 46). The SDT believes it is appropriate to allow entity's flexibility in determining whether the CIP Senior Manager or delegate should review and approve the plan. CIP-003-6 provides for policy review by CIP Senior Manager only.

In R1, NRECA recommends that the SDT reiterate "high and medium impact" each time BES Cyber System is used in the requirement parts. (This would be added to part 1.1, 1.2, and 1.2.5.) We also question why 1.2.1 and 1.2.2 is specific to "products or services provided to the Responsible Entity," but 1.2.4 is not. We recommend adding this phrase to 1.2.4: "Disclosure by vendors of known vulnerabilities related to products or services provided to the Responsible Entity." Further, we recommend further clarification to the term "vendor." We recommend explaining this term in the Guidelines and Technical Basis (GTB) section rather than the Rationale. The intent of the term "vendor" is not a Rationale for the standard. Additionally, there are a number of potential vendor scenarios which should be clarified in the GTB. The vendor explanation excludes other NERC Registered Entities, but it is not clear whether this exclusion also applies to other utilities not registered with NERC. It is also not clear whether the	

term vendor is intended to apply to contract employees, particularly those who may be using company issued computer equipment and receiving company developed security training. It would seem that the Transient Cyber Asset requirements already sufficiently mitigate this risk and additional requirements are not necessary. We also find that the term "system integrators" is not well understood and request further clarification.

Response. Thank you for your comment. The main body text in Requirement R1 establishes applicability to high and medium impact BES Cyber Systems; the SDT believes repeating this applicability in the requirement parts is redundant. The SDT agrees that Part 1.2.4 should be clarified to apply to 'products or services provided to the Responsible Entity' and has added this clarification Part 1.2.4 in Draft 3 of proposed CIP-013-1. The SDT believes the description of *vendor* in the Rationale section gives clarity to the CIP-013 requirements without limiting flexibility needed by responsible entities for developing and implementing cyber security risk management plans that meet the entity's procurement and cyber security needs. This description and all information in the rationale sections remain with the standards in the supplemental material section to inform Responsible Entities, compliance, and enforcement staffs. Requirement R1 Part 1.2 pertains to procuring BES Cyber Systems, which the SDT does not believe would entail staff augmentation contractors. Responsible entities should consider entity-specific circumstances related to staff augmentation contractors or procurement of products or services from non-NERC utility in developing their plan.

Requirements R1 and R2 essentially shift the burden for ensuring that BES Cyber System hardware and software vendors, resellers, and integrators follow sound security management practices onto individual Responsible Entities, which N&ST considers both unfair and unreasonable, for small entities in particular. The just-endorsed (by NERC) CIP-013 Implementation Guidance document suggests an	

entity could address R1.1's requirement to "identify and assess cyber security risk(s) to the Bulk Electric System from vendor products or services" by means of a series of interactions with prospective vendors that comprise, for all intents and purposes, a risk assessment of the vendor, conducted by the entity. What recourse would a small entity have if a prospective supplier, perhaps the only one available, declined to cooperate with such an in-depth examination of its internal processes? R2, which requires the implementation of the entity's R1 plan(s), acknowledges a vendor may be disinclined to agree to contractual obligations to support one or more specific elements of an entity's R1 risk management plan. However, it contains no language that acknowledges this could make it difficult, if not impossible, for the entity to fully implement its R1 plan. N&ST believes this creates significant compliance risks for entities that may have few if any other options in some procurement situations. N&ST therefore recommends the addition of language similar to existing technical feasibility language in CIP-002 through CIP-011.

N&ST recommends that R2 be modified to state that a Responsible Entity has the option of describing its implementation of R1 Part 1.2.3 (revocation of vendor remote access privileges) in its CIP-004 Access Management and/or Access Revocation documentation.

N&ST recommends that R2 be modified to state that a Responsible Entity has the option of describing its implementation of R1 Part 1.2.6 (vendor remote access) in its CIP-005 ESP and Interactive Remote Access documentation.

N&ST recommends that R2 be modified to state that a Responsible Entity has the option of describing its implementation of R1 Part 1.2.5 (vendor software authenticity and integrity) in its CIP-010 Configuration Change Management documentation.

Initial CIP Senior Manager or delegate approval of risk management plan(s) should be added to R1. N&ST notes the initial implementation of R3 specified in the draft Implementation Plan is on or before the Effective Date. If that language is retained, there will be no need to add CIP Sr Manager or delegate approval to R1.

CIP-013 R2 and/or the Implementation Plan should contain "trigger" language for R2 that clarifies an entity must implement its R1 risk management plan(s) for new procurement contracts signed on or after the Effective Date of CIP-013. Entities with no new procurement contracts or no new in-progress procurements on the Effective Date should not be expected to be able to demonstrate compliance with R2 at that time.

Response. Thank you for your comment.

The SDT's approach with CIP-013-1 is consistent with Order No. 829, which directed NERC to develop requirements for NERC entities and to not impose obligations directly on vendors. The requirements provide responsible entities with flexibility to use tailored planning and procurement processes and do not obligate or hold the responsible entity accountable for vendor cooperation. The SDT believes the responsible entity can implement procurement processes as required by Part 1.2 without need for compliance exception because of the flexibility that is inherent in CIP-013. Examples of procurement processes are contained in the Implementation Guidance. Proposed CIP-013-1 Requirement R2 does not preclude the responsible entity from using the responsible entity's documentation related to other CIP standards. However, the documentation must demonstrate use of the responsible entity's supply chain cyber security risk management plan in procuring BES Cyber Systems. Proposed CIP-013-1 addresses initial approval of the responsible entity's plan through the Implementation Plan. The Implementation Plan specifies when an entity must begin using its plan, and has been revised for clarity (see Implementation Plan section). The SDT agrees that entities should not be expected to demonstrate compliance with Requirement R2 if the entity has not initiated procurement processes when the requirement is effective.

NPPD supports the comments submitted by the MRO NSRF for CIP-013. In addition: NPPD is concerned that this Standard is not sufficiently represented to be auditable. First, the Standard is not performance based, which leads to auditor discretion, which leads to inconsistency among the Regional Entities across the NERC footprint. Second, the Implementation Guidance document has words that protect the entities from interpretation risk, however are not part of the Standard; which leaves the auditor to determine the intent of the drafting team. This is true in the rationale section for R1 which has wording which would minimize interpretation risk to entities, however are not reflected in the Standard. The Rationale states that the supplier must	

meet CIP-013 unless it is either not offered by the supplier or would significantly increase the cost of the agreement. This needs to be included in the Standard or as a footnote in the Standard. This would be very important to clarity in audit practices. In addition, the Standard should specifically state that as long as evidence demonstrates that all items expressly identified in R1 are contained in the "plan" and are implemented via R2 that entities shall not be out of compliance (there should be no findings for opinion on intent or security).

As with other recently produced CIP Standards, this Standard is being "rushed" to satisfy a FERC directive and without concise and clear wording, implementation considerations of all impacted parties, and the means for auditors to audit to a performance based Standard and understood audit practices. An extended comment/balloting period should be requested of NERC/FERC in order to produce an auditable Standard.

Other comments:

There are no parameters for Standard applicability. If a piece of equipment is purchased and the vendor and entity meet the Standard, do subsequent purchases of associated parts relative to the equipment or replacement parts of the equipment from other vendors need to also meet the Standard?

R1 Parts 1.2.1 and 1.2.2 "vendor-identified incident" is not clear. This needs to have clarity added in the Standard. In addition "identified" should be changed to "confirmed".

CIP-013 R1 parts 1.2.5 and 1.2.6 are covered in CIP-005 and CIP-010. CIP-013 parts 1.2.5 and 1.2.6 should be removed to avoid duplication. The revised CIP-013 parts 1.2.5 and 1.2.6 appear to apply to software source and identity verification (now required "when the method to do so is available" by CIP-010) and determining active vendor remote access sessions (now required by CIP-005). Having CIP-013 parts that require entities to perform the underlying function and to take those functions into account during the procurement process is needless duplication that does not increase security or reliability and could result in compliance "double jeopardy."

Response. Thank you for your comment.

The SDT is addressing the concern with potentially varying compliance interpretations by developing Implementation Guidance. The ERO Enterprise has endorsed the CIP-013-1 Implementation Guidance in accordance with NERC's Compliance Guidance policy. The ERO Enterprise's endorsement of the Implementation Guidance examples means the ERO Enterprise CMEP staff will give these examples deference when conducting compliance monitoring activities. As stated in the compliance guidance policy, "Registered entities can rely upon the example and be reasonably assured that compliance requirements will be met with the understanding that compliance determinations depend on facts, circumstances, and system configurations."

The responsible entity's supply chain cyber security risk management plan applies to high and medium impact BES Cyber Systems and must include procurement processes as specified in Part 1.2. The responsible entity is required to implement its plan, per Requirement R2. Any procurements of BES Cyber Systems including replacement of BES Cyber Systems, falls in scope of the entity's plan.

Implementation Guidance provides examples of processes to address Parts 1.2.1 and 1.2.2 that provide additional clarity. A responsible entity can provide additional clarity if the responsible entity believes it is necessary in its cyber security supply chain risk management plan.

Requirement R1 Parts 1.2.5 and 1.2.6 address procurement processes related to software verification and vendor remote access, respectively. The proposed requirements in CIP-010-3 and CIP-005-6 are operational in nature and not related to procurement. Therefore the CIP-013 requirements are not duplicative of the CIP-010-3 and CIP-005-6 requirements. The SDT believes both operational controls and procurement related processes provide reliability benefit and are needed to address the directives in Order No. 829.

Requirements 1.2 through 1.2.4. are extremely difficult to negotiate and implement with vendors, especially across such a diverse industry and diverse set of vendors. As written, the requirements make the vendor responsible for providing notifications to the Responsibility Entity. This puts the burden on the Responsible Entity to enforce these requirements through contractual obligations. The rationale states that "such contract enforcement is not subject to this Reliability Standard;" however, the performance of these requirements belongs solely to entities that are outside the jurisdiction of NERC and the Commission and can be held accountable only through contraction enforcement. As written, these specific reliability requirements put the Responsible Entities in a precarious position of acting as a surrogate regulator on a secondary industry.

If the intent is not to make the Responsible Entity accountable from a compliance stand point for the actions of vendors or other parties, the language should be written into the requirement wording. The clause in R2.2 states this exception, but does not then clarify what the Responsible Entity is obligated to do. The Responsible Entity is supposed to negotiate those terms, try to obtain that information, but if they can't then is it still not a violation? Will the auditors also look at it from this perspective?

Furthermore, the language of the R1.2 to R1.2.4 should be changed to meet the SDT's objectives while relying solely on the actions of the Responsible Entity and not those of any other party. However, if the intent is to include the items in R1.2 in the process for consideration of risk when selecting a vendor or product during the procurement process as the draft guidance seems to indicate, then those intentions should be explicit in the requirement language.

There is no issue with Requirement 3 requiring a periodic assessment of the supply chain cyber security risk management controls in order to update plans, etc. However, a recurring review by business unit stakeholders should be sufficient. The requirement to have the CIP Senior Manager or delegate approve the plan is simply a formality and is administrative in nature and provides no further security value.

Response. Thank you for your comments.

The SDT's approach in CIP-013-1 is in line with FERC Order No. 829, which stipulates that the standards should not impose obligations directly on vendors (P 36). The requirements provide responsible entities with flexibility to use tailored planning and procurement processes and do not obligate or hold the responsible entity accountable for vendor cooperation. The SDT believes the note in Requirement R2 establishes that terms and conditions, and vendor performance with contract provisions, are not in scope.
The SDT developed Implementation Guidance, which has been endorsed by the ERO Enterprise, to provide examples of compliant approaches to meet the requirements. As stated in NERC's approved Compliance Guidance Policy, "Registered entities can rely upon [the examples] and be reasonably assured that compliance requirements will be met."

The objective of Part 1.2 is for entities to include these topics in their plans so that procurement and contract negotiation processes address the applicable risks. Implementation of elements contained in the entity's plan related to Part 1.2 may be accomplished through the entity's procurement and contract negotiation processes. Examples are provided in the Implementation Guidance.

Requirement R3 addresses the Order No. 829 directive for requiring CIP Senior Manager review and approval of the plan. (P. 46).

- Please provide clarification on what a "contract" is. For instance, is an annual software license a contract?
- Please provide feedback as to what Registered Entities should do if vendors refuse to the specifications within the CIP-013 requirements.

• Please provide further clarifications and expectations within Measure 2 to ensure entities are prepared for compliance oversight expectations.

Dislikes 0	
Response. Thank you for your comments. The objective of Part 1.2 is for entities to include the listed topics in their supply chain cyber security risk management plans so that procurement and contract negotiation processes address the applicable risks. Contracts a a type of procurement vehicle used to obtain products and services. An annual software license can be a type of contract. The requirements provide responsible entities with flexibility to use tailored planning and procurement processes and do not obligate or hold the responsible entity accountable for vendor cooperation. Responsible entities have flexibility to address vendor responsiveness. The SDT believes the evidence listed in Measure M2 covers the various types of evidence that an entity would use in implementing its supply chain cyber security risk management plan to plan and procure BES Cyber Systems. Correspondence, policy documents, or working documents that can show how the entity implemented processes such as those listed in the Implementation Guidance to plan and procure applicable BES Cyber Systems could be used as evidence.

SPP offers comments on the subrequirements of R1, as follows:	

R1.1 – SPP recommends that subpart (i) be modified to accommodate the procurement "and/or" installation of vendor equipment "and/or" software and, further, requests clarification as to the intended meaning of the "transitions from one vendor(s) to another vendor(s)" concept within the context of subpart (ii).

1.2.1 – SPP recommends that "products or services" be modified to reference "products and/or services."

1.2.2 – SPP requests clarification as to the "coordination" intended to be imposed, suggesting that the requirement may stand alone with any coordination component removed.

1.2.4 – SPP recommends that the 1.2.4 be modified to appropriately limit vendor disclosure of known vulnerabilities to the products and/or services provided to the Responsible Entity, consistent with 1.2.1. In addition, SPP notes that there is a lack of consistency between 1.2.1 and 1.2.4 with the use of the terms "vendor equipment" and "software" in 1.2.1, but uses the term "products" in subrequirement 1.2.4. SPP seeks clarification on whether the SDT intends "products" to be broader than equipment and software. SPP recommends that the SDT be consistent and use "vendor equipment" and "software" throughout, or provide additional clarification about the scope of the term "products."

1.2.6- SPP requests clarification as to the "coordination" intended to be imposed, suggesting that the requirement may stand alone with the coordination component removed. SPP believes the "coordination of controls" may be interpreted as requiring the Responsible Entity and vendor to jointly develop and/or coordinate controls, rather than simply requiring the Responsible Entity to address the requisite remote access controls in its supply chain cyber security risk management plan(s). As drafted, SPP is concerned that it is unclear what is required for "coordination," as well as how such coordination would be evidenced at audit.

Response. Thank you for your comments. The SDT does not believe the suggested changes to Part 1.1 or 1.2.1 provide additional clarity.

The SDT has revised Part 1.2.4 for clarity. The SDT does not believe use of 'and/or' provides additional clarity.

The ERO Enterprise-endorsed Implementation Guidance lists examples of compliant approaches to Requirement R1 Parts 1.2, including 1.2.2 and 1.2.6. The SDT believes the standard and the examples in the Implementation Guidance provide the necessary clarity. Responsible Entities can provide additional detail in their Supply Chain Cyber Security Risk Management Plan.

Comment	

NRG offers comments on the sub requirements of R1, as follows:

R1.1 – NRG recommends that subpart (i) be modified to accommodate the procurement "and/or" installation of vendor equipment "and/or" software and, further, requests clarification as to the intended meaning of the "transitions from one vendor(s) to another vendor(s)" concept within the context of subpart (ii).

1.2.1 – NRG recommends that "products or services" be modified to reference "products and/or services."

1.2.2 – NRG requests clarification as to the "coordination" intended to be imposed, suggesting that the requirement may stand alone with any coordination component removed.

1.2.4 – NRG recommends that the 1.2.4 be modified to appropriately limit vendor disclosure of known vulnerabilities to the products and/or services provided to the Responsible Entity, consistent with 1.2.1. In addition, NRG notes that there is a lack of consistency between 1.2.1 and 1.2.4 with the use of the terms "vendor equipment" and "software" in 1.2.1, but uses the term "products" in sub requirement 1.2.4. NRG seeks clarification on whether the SDT intends "products" to be broader than equipment and software. NRG recommends that the SDT be consistent and use "vendor equipment" and "software" throughout, or provide additional clarification about the scope of the term "products."

1.2.6- NRG requests clarification as to the "coordination" intended to be imposed, suggesting that the requirement may stand alone with the coordination component removed. NRG believes the "coordination of controls" may be interpreted as requiring the Responsible Entity and vendor to jointly develop and/or coordinate controls, rather than simply requiring the Responsible Entity to address the requisite remote access controls in its supply chain cyber security risk management plan(s). As drafted, NRG is concerned that it is unclear what is required for "coordination," as well as how such coordination would be evidenced at audit.

Additionally: NRG is concerned that the R1 guidance provides details which are beyond the scope of R1.

NRG requests that the NERC SDT consider re-wording of R1 Part 1.2.1 and 1.2.4 to easily understand what is expected. These Parts appear to be duplicative. The Guidance does not adequately distinguish between the Parts. One interpretation is that Part 1.2.1 is for products/services and that Part 1.2.4 is for vulnerabilities in the product. It is not clear if these Parts expect information sharing at the time of procurement or on-going?

In R1 Parts 1.2.1 and 1.2.2, the term "vendor-identified incident" is unclear. It could mean incidents that were identified by another party, specific to the products of a specific vendor. It could mean only incidents identified by the vendor. Suggest changing "identified to "acknowledged" or "confirmed."
