Definition of vendor is not a NERC defined term. The term "vendor" is also used in the proposed CIP-005.

Request more guidance for the term "vendor" and use cases. Guidance should prompt Entities to include their definition of "vendor" in their plan(s).

NRG recommends removing those items (CIP-013 R1 subparts 1.2.5 and 1.2.6) that are covered in CIP-005 and CIP-010 from CIP-013. There are substantive requirements being incorporated into CIP standards to perform functions for all BES Cyber Systems (to the extent possible), it is not clear that there is a remaining need for a separate standard requiring that those items be addressed during the procurement process. This appears to apply to software source and identity verification (now required "when the method to do so is available" by CIP-010) and determining active vendor remote access sessions (now required by CIP-005). Having a standard that requires you to perform the underlying function and also to take those functions into account during the procurement process is needless duplication that does not increase security or reliability and could result in compliance "double jeopardy."

NRG requests SDT consideration that: The Compliance and/or Implementation Guidance should make clear that, as long as evidence demonstrates that all items expressly identified in CIP-013, R1 are contained in a Supply Chain Cyber Security Management Plan or Plans, and are implemented pursuant to R2, entities will not be found out of compliance. More specifically, NRG requests NERC SDT consideration of the assertion that Registered Entities should not be subjected to CIP-013 noncompliance findings resulting from a difference of opinion concerning security adequacy.

CIP-013-1 R1.2 – "One or more process(es) used in procuring BES Cyber Systems that address the following, as applicable: " The term "as applicable" implies it is optional. Who determines whether something is applicable or not? NRG suggests that NERC SDT remove it or provide additional clarity.

CIP-013-1 R1.2.3, NRG has concerns that it is not clear when vendors have to notify if remote or onsite access should no longer be granted to vendor representatives. 2 hrs, 24 hrs, or 3 months?

Is there an expectation of the vendor to disclose non-public information in 1.2.4? Is this only during contracting or is there an expectation of new vulnerabilities to be disclosed?

1.1 – Delete "planning for". Or if the use of "planning for" in R1 creates a necessary distinction between 1.1 and 1.2, what is it?

- What is implied by *(ii) transitions from one vendor(s) to another vendor(s)*? Why is this distinction necessary? Wouldn't a vendor transition require a new contract? Does this refer to the act of severing existing remote access permissions? Subcontracting?

-

- R1.2.2: "Coordination of responses to vendor-identified incidents….", it is not clear who should be doing the coordinating and why this is necessary. NRG requests SDT consideration of suggestion to delete.

Furthermore, NRG requests NERC SDT consideration of the following comments:

· On page 6 of CIP-013 draft:

NRG requests that the NERC standard drafting team consider providing additional clarification to the following paragraph:

For example, entities can implement the plan by including applicable procurement items from their plan in Requests for Proposals (RFPs) and in negotiations with vendors. Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan. Although the expectation is that Responsible Entities would enforce the security-related provisions in the contract based on the terms and conditions of that contract, such contract enforcement and vendor performance or adherence to the negotiated contract is not subject to this Reliability Standard.

NRG requests that industry have the ability to accept a level of risk through internal risk assessment processes if a supplier is unwilling to negotiate and accept the cyber security terms into negotiated contracts.

· On page 6 of CIP-013 draft:

NRG requests that the NERC standard drafting team consider providing additional clarification to the following paragraph:

A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

NRG requests that the term vendor be further clarified to specify if meaning developers, product resellers or system integrators of "third-party" software, system components, or information system services, etc (versus internal company developers).

· On page 8 of CIP-013 draft (under R2):

NRG requests that the NERC standard drafting team consider providing additional clarification to the following paragraph:

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

NRG requests further understanding of what, if any expectations are to be included in T&Cs and what are the expectations of how the vendor will be expected to perform as the term "expectations" is listed on page 6 of the standard?

Response. Thank you for your comments.

The SDT does not believe the suggested changes to Part 1.1 or 1.2.1 provide additional clarity.

The SDT has revised Part 1.2.4 for clarity. The SDT does not believe use of 'and/or' provides additional clarity.

The ERO Enterprise-endorsed Implementation Guidance lists examples of compliant approaches to Requirement R1 Parts 1.2, including 1.2.2 and 1.2.6, that clarify the SDT's intent. A responsible entity may provide any additional clarity that the responsible entity believes is needed in its supply chain cyber security risk management plan. The ERO Enterprise endorsement of the Implementation Guidance examples means the ERO Enterprise CMEP staff will give these examples deference when conducting compliance monitoring activities.

The SDT believes the description of *vendor* in the Rationale section gives clarity to the CIP-013 requirements without limiting flexibility needed by responsible entities for developing and implementing cyber security risk management plans that meet the entity's procurement and cyber security needs. This description and all information in the rationale sections remain with the standards in the supplemental material section to inform Responsible Entities, compliance, and enforcement staffs. The SDT agrees that some responsible entities may need to provide additional entity-specific clarifications in their cyber security risk management plans.

Requirement R1 Parts 1.2.5 and 1.2.6 address procurement processes related to software verification and vendor remote access, respectively. The proposed requirements in CIP-010-3 and CIP-005-6 are operational in nature and not related to procurement. Therefore the CIP-013 requirements are not duplicative of the CIP-010-3 and CIP-005-6 requirements. The SDT believes both operational controls and procurement related processes provide reliability benefit and are needed to address the directives in Order No. 829.

The SDT is addressing the concern with potentially varying compliance interpretations by developing Implementation Guidance. As previously stated, the ERO Enterprise has endorsed the CIP-013-1 Implementation Guidance in accordance with NERC's Compliance Guidance policy. The ERO Enterprise's endorsement of the Implementation Guidance examples means the ERO Enterprise CMEP staff will give these examples deference when conducting compliance monitoring activities. Accordingly, "Registered entities can rely upon the example and be reasonably assured that compliance requirements will be met with the understanding that compliance determinations depend on facts, circumstances, and system configurations." (See Compliance Guidance Policy on NERC's compliance page)

Part 1.1 and Part 1.2 address distinct directives from Order No. 829 pertaining to planning and procurement, respectively. (see Rationale and Order No. 829 P. 56 and P.59). Examples of processes or activities that could address the objectives for both are contained in the Implementation Guidance.

Per Part 1.1, responsible entities must have process(es) that they use when planning for procurement of BES Cyber Systems to consider cyber security risks to the BES that could arise from transitions from one vendor to another vendor. The intent is for the responsible entity to consider cyber security risks that may result from the change in vendor, which may inform the entity's procurement process.

The SDT believes the cited paragraph "For example, entities can implement the plan by including applicable procurement items from their plan in Requests for Proposals (RFPs) and in negotiations with vendors…", along with the note in Requirement R2, addresses the commenter's concerns regarding the responsible entity's obligation when vendors may be unable or unwilling to negotiate. Implementation Guidance provides additional examples of compliant approaches that are not dependent on vendor cooperation. The SDT believes the vendor description provided in the rationale addresses the commenter concerns about internal company developers. The rationale section states, in part: *The term vendor(s) as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contract with to supply BES Cyber Systems and related services.* A responsible entity can provide further clarification in its supply chain cyber security risk management plan if the responsible entity deems it necessary. As indicated in the note for Requirement R2, the following are not in scope for CIP-013: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

Comment	
CIP-005 has had R2.4 and R2.5 added as they pertain to interactive user access and remote system to system access tracking. These were previously in the CIP-013 standard as part of the Supply Chain requirement. Due to CIP-005 R2 already dealing with an Intermediate system for Interactive Remote access, it seems logical that this requirement be expanded to include these. The clarification that we don't have and would like from NERC/WECC is the intent of the following statement in CIP-013 R1.2.5 ***"Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System".*** There is no Guidelines and technical basis at the end of the standard for this	

This has a very large implication as this says all software provided by a vendor has to perform an integrity and authenticity verification. This could implicate a dedicated channel from the vendor validating through software certificates which would imply entities forcing software vendors to provide this mechanism, which the likelihood of meeting this for MS, Symantec, (non-control system software) is slim. MD5 checksums can not validate the integrity of the software as this hashing mechanism was broken in 2005 (although a lot of software vendors still use it). So we need clarification on this before a vote recommendation can be established for CIP-013 R1.

Dislikes 0	
Response. Thank you for your comment. The objective of verifying software integrity and authenticity (Part 1.2.5) is to help ensure that software installed on BES Cyber Systems is not modified prior to installation without the awareness of the software supplier and is not counterfeit. Part 1.2.5 is not an operational requirement for entities to perform such verification; instead, it requires entities to address the software integrity and authenticity issue in its procurement processes (such as in Requests for Proposal, contract negotiations, or other procurement processes). Part 1.2.5 does not obligate the responsible entity to obtain, or the vendor to provide, the means for performing software verification. Factors such as competition, limited supply sources, expense, criticality of the product or service, and maturity of the vendor or product line could affect the terms and conditions ultimately negotiated by the parties and included in a contract. As a result, actual contract terms are not in scope for CIP-013.

Comment	
PJM agrees, with the following suggested edits:	

Within 1.2.1 and 1.2.2, PJM feels that "incident" need further clarification as it is a bit broad (i.e. could be interpreted as anything from a phishing attempt to an actual breach). PJM suggests it be narrowed down to actual breaches. Additionally, "security risk to the Responsible Entity" should be "security risk to the BES." Lastly, we like how the notification and coordination pieces are split out. *Within 1.2.3, PJM suggests changing "no longer be granted" to "should be revoked" to strengthen the language.* *Within 1.2.5, PJM suggests adding in "firmware" and "where the method to do so is available" as to match the CIP-010 language.*	
Likes 0	
Dislikes 0	
Response. Thank you for your comment. The SDT does not believe the suggested changes to Part 1.2.1 – 1.2.3 provide additional clarity. The SDT understands *firmware* to be a type of software. A responsible entity may provide any additional clarity that the responsible entity believes is needed in its supply chain cyber security risk management plan.

The understanding of the intent and purpose of CIP-013 is very dependent on the Implementation Guidance document. There is no guarantee that this document will be approved by NERC even if CIP-013 is approved. Request clarification on whether the SDT intends "products" to be broader than equipment and software. Recommend that the SDT be consistent and use "vendor equipment" and "software" throughout, or provide additional clarification about the scope of the term "products."	

There are concerns about language related to procurement contracts, in particular use of master agreements, piggyback agreements, and evergreen agreements. To address these concerns and position CIP-013 as a performance based Standard, we recommend that all references to "contracts" and most references to "procurement" be struck from CIP-013, except the note in R2 that states:

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

Our reasoning is that there are means other than vendor contract negotiations, contract language, and procurement processes to address and achieve the protections required by R1.2. It is immaterial how these protections are achieved. Focusing thinking and audit approach on contracts and procurement (even if specific contract terms are not in scope) limits flexibility, is unnecessarily prescriptive, and does not reflect performance-based principles. As such we ask that R1.2 be revised as follows:

1.2. *One or more process(es) used in procuring for its newly procured BES Cyber Systems that address the following elements, as applicable:*

("new" meaning obtained after the implementation of CIP-013).

Request that the term "elements" be included in R1.2, as shown above, to clearly align with the VSLs for this requirement.

Associated guidance in the "Rationale for R1" and in the separate implementation guidance should be revised to reflect the change to a performance-based requirement in which contract terms and contract negotiations play no function in auditing. Contract terms might be used by an entity as evidence of performance, but there should be no expectation by audits or subtext in the Standard or implementation guidance that anything having to do with contracts or procurement processes is required. There should be no expectation of what might or should be included within Requests for Proposals, no expectation of when contracts might or should be renegotiated, no expectations of what terms might or should be included or requested, and no expectations of what terms might or should be found in a prudent and proper contract. Ultimately, there should be no expectation that such protections be achieved solely through the procurement process. The objective is achieving each protection, not in how it is achieved.

In the absence of such a change, we requests substantial additional clarification about how, without contract terms and contract negotiations being auditable, performance of R2 implementation will be audited and assessed.

Response Thank you for your comment.

The ERO Enterprise has endorsed the CIP-013-1 Implementation Guidance in accordance with NERC's Compliance Guidance policy. The ERO Enterprise's endorsement of the Implementation Guidance examples means the ERO Enterprise CMEP staff will give these examples deference when conducting compliance monitoring activities.

Vendor equipment and software are types of products. The SDT does not believe alternate wording for Requirement R1 provides additional clarity. A responsible entity may provide additional clarity that the responsible entity believes is needed in its supply chain cyber security risk management plan.

The SDT believes the requirements for procurement processes are necessary to address the Order No. 829 directives (P. 59). The proposed requirements provide flexibility for entities to develop a plan that includes procurement processes for various types of procurement activities including multi-party wide-area contracts, master agreements and piggyback agreements. The SDT has revised the rationale to include types of procurement activities listed by the commenter among the other examples.

The SDT has revised the VSL for Requirement R2 to remove the word *element*.

The SDT believes the evidence listed in Measure M2 covers the various types of evidence that an entity would use in implementing its supply chain cyber security risk management plan to plan and procure BES Cyber Systems. Correspondence, policy documents, or working documents that can show how the entity implemented processes such as those listed in the Implementation Guidance to plan and procure applicable BES Cyber Systems could be used as evidence.

Implementation Guidance provides examples of processes to address Parts 1.2.1 and 1.2.2 that provide additional clarity. A responsible entity can provide additional clarity if the responsible entity believes it is necessary in its cyber security supply chain risk management plan.

Request re-wording of R1 Part 1.2.1 and 1.2.4 to easily understand what is expected. These Parts appear to be duplicative. Guidance does not adequately distinguish between the Parts. One interpretation is that Part 1.2.1 is for products/services and that Part 1.2.4 is for vulnerabilities in the product. It is not clear if these Parts expect information sharing at the time of procurement or on-going?

In R1 Parts 1.2.1 and 1.2.2, the term “vendor-identified incident” is unclear. It could mean incidents that were identified by another party, specific to the products of a specific vendor. It could mean only incidents identified by the vendor. Suggest changing “identified to “acknowledged” or “confirmed.

Recommend removing CIP-013 R1 subparts 1.2.5 and 1.2.6 from CIP-013 since these are covered in CIP-005 and CIP-010. There are substantive requirements being incorporated into CIP standards to perform functions for all BES Cyber Systems (to the extent possible), it is not clear there is a remaining need to for a separate standard requiring that those items be addressed during the procurement process. This appears to apply to software source and identity verification (now required “when the method to do so is available” by CIP-010) and determining active vendor remote access sessions (now required by CIP-005). Having a standard that requires you to perform the underlying function and also to take those functions into account during the procurement process is needless duplication that does not increase security or reliability and could result in compliance “double jeopardy.”

The Compliance and/or Implementation Guidance should make clear that, as long as evidence demonstrates that all items expressly identified in CIP-013, R1 are contained in a Supply Chain Cyber Security Management Plan or Plans, and are implemented pursuant to R2, entities will not be found out of compliance. More specifically, entities should not be subjected to CIP-013 noncompliance findings resulting from a difference of opinion concerning security adequacy.

Is there an expectation of the vendor to disclose non-public information in 1.2.4? Is this only during contracting or is there an expectation of new vulnerabilities to be disclosed?

{C}1.1 – Delete “planning for”. Or if the use of “planning for” in R1 creates a necessary distinction between 1.1 and 1.2, what is it?

- What is implied by *(ii) transitions from one vendor(s) to another vendor(s)*? Why is this distinction necessary? Wouldn't a vendor transition require a new contract? Does this refer to the act of severing existing remote access permissions? Subcontracting? - R1.2.2: "Coordination of responses to vendor-identified incidents….", it is not clear who should be doing the coordinating and why this is necessary. Suggest deleting.

Response. Thank you for your comments.

The SDT has provided examples of processes related to Part 1.2.1 through 1.2.6 in the Implementation Guidance. A responsible entity may provide any additional clarity that the responsible entity believes is needed in its supply chain cyber security risk management plan.

The SDT believes the description of *vendor* in the Rationale section gives clarity to the CIP-013 requirements without limiting flexibility needed by responsible entities for developing and implementing cyber security risk management plans that meet the entity's procurement and cyber security needs. This description and all information in the rationale sections remain with the standards in the supplemental material section to inform Responsible Entities, compliance, and enforcement staffs. The SDT agrees that some responsible entities may need to provide additional entity-specific clarifications in their cyber security risk management plans.

Requirement R1 Parts 1.2.5 and 1.2.6 address procurement processes related to software verification and vendor remote access, respectively. The proposed requirements in CIP-010-3 and CIP-005-6 are operational in nature and not related to procurement. Therefore the CIP-013 requirements are not duplicative of the CIP-010-3 and CIP-005-6 requirements. The SDT believes both operational controls and procurement related processes provide reliability benefit and are needed to address the directives in Order No. 829.

The SDT is addressing the concern with potentially varying compliance interpretations by developing Implementation Guidance. The ERO Enterprise has endorsed the CIP-013-1 Implementation Guidance in accordance with NERC's Compliance Guidance policy. The ERO Enterprise's endorsement of the Implementation Guidance examples means the ERO Enterprise CMEP staff will give these examples deference when conducting compliance monitoring activities. As stated in the compliance guidance policy, "Registered entities can rely upon the example and be reasonably assured that compliance requirements will be met with the understanding that compliance determinations depend on facts, circumstances, and system configurations."

Part 1.1 and Part 1.2 address distinct directives from Order No. 829 pertaining to planning and procurement, respectively. (see Rationale and Order No. 829 P. 56 and P.59). Examples of processes or activities that could address the objectives for both are contained in the Implementation Guidance. Per Part 1.1, responsible entities must have process(es) that they use when planning for procurement of BES Cyber Systems to consider cyber security risks to the BES that could arise from transitions from one vendor to another vendor. The intent is for the responsible entity to consider cyber security risks that may result from the change in vendor, which may inform the entity's procurement process.

AZPS agrees with the proposed requirements in CIP-013-1 subject to the below requests for clarification and recommended revisions/additions. · AZPS requests that the SDT consider and provide guidance regarding the applicability of the requirements of CIP-013-1 where the traditional procurement process is not applicable to a particular purchase. For example, software that is purchased from a retail source rather than a vendor is often purchased subject to existing retail terms and conditions and without the opportunity to negotiate additional terms and conditions around the procurement. · AZPS further recommends the following changes/additions: · Requirement 1.2.4 - "Disclosure by vendors of known vulnerabilities ***when they become known to the vendor.***" · Requirement 1.2.5 as written is duplicative with CIP-010; hence, AZPS recommends this Requirement be deleted or revised to address the process for software integrity and authenticity, rather than actual verification of those.	

· Requirement 1.2.6 – AZPS recommends removal of the word “coordination” and on the insertion of the term “identification” to address a process for identifying how a vendor handles controls. · Requirement R2 – evidence may not be available for items that are purchased form a retail source, as noted above. AZPS recommends an exception be identified for this purpose.

Response. Thank you for your comment. Proposed CIP-013-1 requires responsible entities to develop and implement a supply chain cyber security risk management plan for BES Cyber Systems that addresses the specified planning and procurement processes. The proposed requirements provide flexibility for entities to develop a plan that includes various types of processes used for procurement by the responsible entity, and to address the applicable topics listed in Parts 1.2.1 through 1.2.6. The SDT does not believe the proposed revision to Part 1.2.4 is needed to meet the objective. A responsible entity can include the clarification in its supply chain cyber security risk management plan. The proposed requirement in CIP-010-3 is operational in nature and not related to procurement. Therefore the CIP-013 requirement is not duplicative of the CIP-010-3. The SDT believes both operational controls and procurement related processes provide reliability benefit and are needed to address the directives in Order No. 829. The SDT does not believe the propose wording for Part 1.2.6 provides additional clarity. A responsible entity can include the clarification in its supply chain cyber security risk management plan. The SDT believes a responsible entity should use its supply chain cyber security risk management plan for all procurements of high and medium impact BES Cyber Systems, and be able to provide evidence for assurance purposes.

Modify R1.2.5 as follows: "Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System when technically feasible; and". This will help address concerns with vendors such as Microsoft that pushes patches when they identify a need. Add language to address allowable exception in the event of CIP Exceptional Circumstances for R2 (e.g. patches issued with ransomware attack in-progress needed immediate action to be taken). Luminant would prefer that the CIP-013 standard be formatted similar to other CIP standards with the use of tables (e.g.CIP-004-6 Table R1).	
Likes 0	
Dislikes 0	
Response. Thank you for your comment. Requirement R1 Part 1.2.5 does not require entities to perform software verification, so the SDT does not believe it is necessary to include *when technically feasible*. In implementing its processes in Part 1.2, the responsible entity is not required to include topics in 1.2.1 – 1.2.6 that are not applicable to the item being procured. This would include applications that are not technically feasible. Likewise, the SDT does not believe CIP Exceptional Circumstances apply to implementation of an entity's supply chain cyber security risk management plan. Implementation of elements contained in the entity's plan related to Part 1.2 may be accomplished through the entity's procurement and negotiation processes. Performance of patch management is addressed in other reliability standards and not in scope of CIP-013. The SDT does not believe a table format would provide additional clarity.

OPG request clarification, regarding R1.2.4, of whom the vulnerability must be known by to require disclosure and that it only be for the vendor's own products and only those supplied to the Responsible Entity. As stands, it might be interpreted that vulnerabilities might not need to be disclosed until publicly known, for products the Responsible Entity doesn't have, or for vulnerabilities the vendor might know in products other than its own. Suggest changing to "Disclosure by the vendor of vulnerabilities known to the vendor concerning products and services supplied by the vendor to the Responsible entity. Requirement R1 Part 1.2.4 requires additional clarification for the type of "known vulnerabilities" Vendor definition is required to avoid ambiguity; does the term vendor apply for contract employees/augmented staff/outsourcers?	

Are the requirements R1-R3 enforceable in exceptional circumstances?	
Likes 0	
Dislikes 0	

Response. Thank you for your comment.

The SDT agrees that Part 1.2.4 should be clarified to apply to 'products or services provided to the Responsible Entity' and has added this clarification Part 1.2.4 in Draft 3 of proposed CIP-013-1. A responsible entity can provide additional clarity if the responsible entity believes it is necessary in its cyber security supply chain risk management plan.

The rationale section, including vendor description, becomes part of the guidelines section of the standard following board adoption. An entity can provide additional clarification of vendor relationships in its plan. Requirement R1 Part 1.2 pertains to procuring BES Cyber Systems, which the SDT does not believe would entail staff augmentation contractors. Responsible entities should consider entity-specific circumstances related to staff augmentation contractors or procurement of products or services from non-NERC utility in developing their plan.

The SDT considered whether to include provisions for CIP Exceptional Circumstances in Proposed CIP-013-1, but determined that the exceptions were not appropriate because CIP-013-1 addresses planning and procurement processes.

Concerned that the R1 guidance provides details which are beyond the scope of R1

Request re-wording of R1 Part 1.2.1 and 1.2.4 to easily understand what is expected. These Parts appear to be duplicative. Guidance does not adequately distinguish between the Parts. One interpretation is that Part 1.2.1 is for products/services and that Part 1.2.4 is for vulnerabilities in the product. It is not clear if these Parts expect information sharing at the time of procurement or on-going?

In R1 Parts 1.2.1 and 1.2.2, the term “vendor-identified incident” is unclear. It could mean incidents that were identified by another party, specific to the products of a specific vendor. It could mean only incidents identified by the vendor. Suggest changing “identified to “acknowledged” or “confirmed.”

Definition of vendor is not a NERC defined term. The term “vendor” is also used in the proposed CIP-005.

Request more guidance for the term “vendor” and use cases. Guidance should prompt Entities to include their definition of “vendor” in their plan(s).

Recommend removing those items (CIP-013 R1 subparts 1.2.5 and 1.2.6) covered in CIP-005 and CIP-010 from CIP-013. There are substantive requirements being incorporated into CIP standards to perform functions for all BES Cyber Systems (to the extent possible), it is not clear there is a remaining need to for a separate standard requiring that those items be addressed during the procurement process. This appears to apply to software source and identity verification (now required “when the method to do so is available” by CIP-010) and determining active vendor remote access sessions (now required by CIP-005). Having a standard that requires you to perform

the underlying function and also to take those functions into account during the procurement process is needless duplication that does not increase security or reliability and could result in compliance "double jeopardy." The Compliance and/or Implementation Guidance should make clear that, as long as evidence demonstrates that all items expressly identified in CIP-013, R1 are contained in a Supply Chain Cyber Security Management Plan or Plans, and are implemented pursuant to R2, entities will not be found out of compliance. More specifically, entities should not be subjected to CIP-013 noncompliance findings resulting from a difference of opinion concerning security adequacy. Is there an expectation of the vendor to disclose non-public information in 1.2.4? Is this only during contracting or is there an expectation of new vulnerabilities to be disclosed? 1.1 – Delete "planning for". Or if the use of "planning for" in R1 creates a necessary distinction between 1.1 and 1.2, what is it? - What is implied by *(ii) transitions from one vendor(s) to another vendor(s)*? Why is this distinction necessary? Wouldn't a vendor transition require a new contract? Does this refer to the act of severing existing remote access permissions? Subcontracting? - R1.2.2: "Coordination of responses to vendor-identified incidents….", it is not clear who should be doing the coordinating and why this is necessary. Suggest deleting.

Request re-wording of R1 Part 1.2.1 and 1.2.4 to easily understand what is expected. These Parts appear to be duplicative. Guidance does not adequately distinguish between the Parts. One interpretation is that Part 1.2.1 is for products/services and that Part 1.2.4 is for vulnerabilities in the product. It is not clear if these Parts expect information sharing at the time of procurement or on-going?

The Registered Entity suggests consider revising Section 1.2.3 to clarify under what circumstances vendors would be expected to notify the Registered Entity that vendor remotes access should be revoked. Regarding Section 1.2.4, suggest revising to clarify what type of vulnerabilities would be included in this disclosure.

R1-R2 are clearly stated and provide for the development and implementation of the required CIP-013-1 cyber security plans. R3 sets a clear expectation for periodic reviews and approvals. From an auditor's perspective, requiring the first review and approval of the R1 plan on or before the effective date of CIP-013-1 (Implementation Plan, Initial Performance of Periodic Requirements section, p. 3) provides clear guidance to industry on implementation expectations.

What is the difference between 1.2.1 and 1.2.4? Why is the scope of 1.2.2 limited to vendor-identified incidents? What if a third party identifies an incident? Is there an expectation of the vendor to disclose non-public information in 1.2.4? Is this only during contracting or is there an expectation of new vulnerabilities to be disclosed? 1.1 – Delete “planning for”. Or if the use of “planning for” in R1 creates a necessary distinction between 1.1 and 1.2, what is it? - What is implied by *(ii) transitions from one vendor(s) to another vendor(s)*? Why is this distinction necessary? Wouldn’t a vendor transition require a new contract? Does this refer to the act of severing existing remote access permissions? Subcontracting? - R1.2.2: “Coordination of responses to vendor-identified incidents….”, it is not clear who should be doing the coordinating and why this is necessary. Suggest deleting.

Response. Thank you for your comment. Examples for all of the parts in Part 1.2 are included in the Implementation Guidance. *Incidents* (Part 1.2.1) could be a security breach at a vendor; *vulnerabilities* (1.2.4) could be a product security flaw. Responsible entities can provide additional clarifications in their Supply Chain Cyber Security Risk Management Plans. Part 1.2.2 specifies that the responsible entity must have process used in procurement to address coordination of responses to vendor-identified incidents. The term *vendor-identified* is used because to indicate that the objective is to address those incidents that arise with the vendor from which the product or service is being procured. A responsible entity could choose to use alternate terms, such as third-party, or expand the scope in its Supply Chain Cyber Security Risk Management Plan.	

Part 1.1 and Part 1.2 address distinct directives from Order No. 829 pertaining to planning and procurement, respectively. (see Rationale and Order No. 829 P. 56 and P.59). Examples of processes or activities that could address the objectives for both are contained in the Implementation Guidance. Per Part 1.1, responsible entities must have process(es) that they use when planning for procurement of BES Cyber Systems to consider cyber security risks to the BES that could arise from transitions from one vendor to another vendor. The intent is for the responsible entity to consider cyber security risks that may result from the change in vendor, which may inform the entity's procurement process.

With respect to the proposed Requirement 1 Part 1.2.1, compliance requires the vendor to be responsive to vendor-identified incidents. We can only be compliant if the vendor releases such information. We can't be held responsible for a vendor that does not provide incident related information. This verbiage has to be deemed acceptable when developing the plan(s). With respect to the proposed Requirement 1 Part 1.2.4, compliance requires the vendor to be responsive to disclosing vulnerabilities. We can only be compliant if the vendor releases such information. We can't be held responsible for a vendor that does not disclose vulnerabilities. This verbiage has to be deemed acceptable when developing the plan(s). With respect to the proposed Requirement 1 Part 1.2.5, compliance requires cooperation by the vendor to participate in such a program. We will give procurement preference to vendors willing to participate however we are still at relying on vendor cooperation. We can't be held responsible for a vendor that does not provide accurate verification of software integrity and authenticity. This verbiage has to be deemed acceptable when developing the plan(s).

We support the comments submitted by APPA, including the following recommendations: Re-word R1, Parts 1.2.1 and 1.2.4 to better describe what is expected. The endorsed Guidance does not adequately distinguish between the two parts. "Vendor" is not a NERC-defined term and contributes ambiguity. Those items (CIP-013 R1, Parts 1.2.5 and 1.2.6) covered in CIP-005 adn CIP-010 should be removed from CIP-013 to avoid duplication. The Compliance and/or Implementation Guidance should make clear that, when evidence demonstrates that all items expressly identified in CIP-013 R1 are contained in a Supply Chain Cyber Security Management Plan or Plans, and are implemented pursuant to R2, entities will not be found out of compliance. There is concern about language related to procurement contracts, specifically the use of master agreements, piggyback agreements, and evergreen agreements. All references to "contracts" and most references to 'procurement" should be struck from CIP-013, except the note in R2.

Response. Thank you for your comments.	

The SDT revised Part 1.2.4 for consistency with other parts in Part 1.2. The SDT believes Part 1.2.1 and 1.2.4 meets the reliability objective of Order No. 829 and that the endorsed Implementation Guidance provides additional clarity by describing examples of compliant approaches to meet these parts. Requirement R1 Parts 1.2.5 and 1.2.6 address procurement processes related to software verification and vendor remote access, respectively. The proposed requirements in CIP-010-3 and CIP-005-6 are operational in nature and not related to procurement. Therefore the CIP-013 requirements are not duplicative of the CIP-010-3 and CIP-005-6 requirements. The SDT believes both operational controls and procurement related processes provide reliability benefit and are needed to address the directives in Order No. 829. The SDT is addressing the concern with potentially varying compliance interpretations by developing Implementation Guidance. The ERO Enterprise has endorsed the CIP-013-1 Implementation Guidance in accordance with NERC's Compliance Guidance policy. The ERO Enterprise's endorsement of the Implementation Guidance examples means the ERO Enterprise CMEP staff will give these examples deference when conducting compliance monitoring activities. As stated in the compliance guidance policy, "Registered entities can rely upon the example and be reasonably assured that compliance requirements will be met with the understanding that compliance determinations depend on facts, circumstances, and system configurations."

: Platte River Power Authority (PRPA) continues to be a strong supporter of efforts to ensure the security of the Bulk Electric System and appreciates the time and effort that the SDT has put into considering industry feedback and incorporating it into the current drafts of CIP-005, CIP-010 and CIP-013. PRPA agrees with limiting the requirement to high and medium assets only.	

R1: PRPA generally agrees with the proposed Requirement 1 but is concerned about compliance obligations for procurement activities associated with multi-party wide-area contracts, master agreements and piggyback agreements. An exception, comparable to a CIP Exceptional Circumstance, should be included in the standard for these kinds of procurement activities.

PRPA recommends removing those items (CIP-013 R1 parts 1.2.5 and 1.2.6) covered in CIP-005 and CIP-010 from CIP-013 to avoid duplication. The revised CIP-013 parts 1.2.5 and 1.2.6 appear to apply to software source and identity verification (now required "when the method to do so is available" by CIP-010) and determining active vendor remote access sessions (now required by CIP-005). Having CIP-013 parts that require entities to perform the underlying function and to take those functions into account during the procurement process is needless duplication that does not increase security or reliability and could result in compliance "double jeopardy."

R2: PRPA agrees with the requirement to implement the supply chain cyber security risk management plan as outlined in Requirement 1.

R3: PRPA agrees that a 15-month review period is appropriate to review the supply chain cyber security risk management plan in Requirement 1.

Additionally, PRPA proposes that the regional entities voluntarily assess CIP-013 programs for entities who have audits in the period between standard approval and the effective date. This is similar to when the regional entities performed transition period audits of CIP v5 programs.

Response. Thank you for your comment.	

The SDT revised Part 1.2.4 for consistency with other parts in Part 1.2. The SDT does not believe it is necessary to include 'or its supply chain' in the requirement since this could be covered by the requirement as written. A responsible entity could include such a clarification in its plan if the responsible entity so desires.

Response. Thank you for your comments.

The proposed requirements provide flexibility for entities to develop a plan that includes procurement processes for various types of procurement activities including multi-party wide-area contracts, master agreements and piggyback agreements. The SDT believes that an exception is not needed because of the flexibility provided in the requirements. The SDT has revised the rationale to include types of procurement activities listed by the commenter among the other examples. Some situations, such as when contracts are negotiated on behalf of the responsible entity, could be met by providing input to parties negotiating on behalf of the responsible entity. Proposed CIP-013 does not preclude responsible entities from taking other actions suggested by the commenter to pursue cyber security protections.

The SDT does not believe removing the procurement and contracting process from the scope of the proposed standard would meet the project SAR and directives in Order No. 829, which direct NERC to develop standards to "require entities to develop and implement a plan that includes security controls for supply chain management" (P. 43) and to include certain procurement controls (P. 45). The intent is for responsible entities to accomplish the objective by including the security topics contained in Requirement R1 Parts 1.2.1 – 1.2.6 in the entity's procurement processes, such as RFP, vendor negotiations, or input into cooperative agreements. Evidence could include RFPs or other procurement correspondence that demonstrate the responsible entity's cyber security risk management concepts and controls. Consistent with the Order, the standard obligates responsible entities to address supply chain cyber security risk management without "directly impos[ing] obligations on suppliers, vendors or other entities that provide products or services to responsible entities" (P. 21).

The SDT developed Implementation Guidance, which has been endorsed by the ERO Enterprise, to provide examples of compliant approaches to meet the requirements. As stated in NERC's approved Compliance Guidance Policy, "Registered entities can rely upon [the examples] and be reasonably assured that compliance requirements will be met."

The SDT clarified Part 1.2.4 to apply to 'products or services provided to the Responsible Entity' for consistency with other parts in Part 1.2. Examples of approaches for Part 1.2.1 through 1.2.6 are provided in Implementation Guidance. Responsible entities can provide additional clarification in their supply chain cyber security risk management plans.

The SDT believes the description of *vendor* in the Rationale section gives clarity to the CIP-013 requirements without limiting flexibility needed by responsible entities for developing and implementing cyber security risk management plans that meet the entity's procurement and cyber security needs. This description and all information in the rationale sections remain with the standards in the supplemental material section to inform Responsible Entities, compliance, and enforcement staffs. The SDT agrees that some responsible entities may need to provide additional entity-specific clarifications in their cyber security risk management plans. Requirement R1 Parts 1.2.5 and 1.2.6 address procurement processes related to software verification and vendor remote access, respectively. The proposed requirements in CIP-010-3 and CIP-005-6 are operational in nature and not related to procurement. Therefore the CIP-013 requirements are not duplicative of the CIP-010-3 and CIP-005-6 requirements. The SDT believes both operational controls and procurement related processes provide reliability benefit and are needed to address the directives in Order No. 829. The SDT is addressing the concern with potentially varying compliance interpretations by developing Implementation Guidance. The ERO Enterprise has endorsed the CIP-013-1 Implementation Guidance in accordance with NERC's Compliance Guidance policy. The ERO Enterprise's endorsement of the Implementation Guidance examples means the ERO Enterprise CMEP staff will give these examples deference when conducting compliance monitoring activities. As stated in the compliance guidance policy, "Registered entities can rely upon the example and be reasonably assured that compliance requirements will be met with the understanding that compliance determinations depend on facts, circumstances, and system configurations."

Concerned that the R1 guidance provides details which are beyond the scope of R1 Definition of vendor is not a NERC defined term. The term "vendor" is also used in the proposed CIP-005.	

Request more guidance for the term “vendor” and use cases. Guidance should prompt Entities to include their definition of “vendor” in their plan(s). Request re-wording of R1 Part 1.2.1 and 1.2.4 to easily understand what is expected. In R1 Parts 1.2.1 and 1.2.2, the term “vendor-identified incident” is unclear. Request to merge R1 Part 1.2.1 and 1.2.2 for the notification and the coordination related to vendor-identified incidents. Request to merge R1 Part 1.2.3 and Part 1.2.6 for the notification and the coordination of controls when remote or on site access are required and granted for (i) vendor-initiated interactive remote access, and (ii) system-to-system remote access with a vendor(s). The Compliance and/or Implementation Guidance should make clear that, as long as evidence demonstrates that all items expressly identified in CIP-013, R1 are contained in a Supply Chain Cyber Security Management Plan or Plans, and are implemented pursuant to R2, entities will not be found out of compliance. More specifically, entities should not be subjected to CIP-013 noncompliance findings resulting from a difference of opinion concerning security adequacy.

Response. Thank you for your comments.

The SDT believes the description of *vendor* in the Rationale section gives clarity to the CIP-013 requirements without limiting flexibility needed by responsible entities for developing and implementing cyber security risk management plans that meet the entity’s procurement and cyber security needs. This description and all information in the rationale sections remain with the standards in the supplemental material section to inform Responsible Entities, compliance, and enforcement staffs. The SDT agrees that some responsible entities may need to provide additional entity-specific clarifications in their cyber security risk management plans.

The SDT clarified Part 1.2.4 to apply to ‘products or services provided to the Responsible Entity’ for consistency with other parts in Part 1.2.

The SDT does not believe merging certain parts in Part 1.2 provides additional clarity.

The SDT is addressing the concern with potentially varying compliance interpretations by developing Implementation Guidance. The ERO Enterprise has endorsed the CIP-013-1 Implementation Guidance in accordance with NERC's Compliance Guidance policy. The ERO Enterprise's endorsement of the Implementation Guidance examples means the ERO Enterprise CMEP staff will give these examples deference when conducting compliance monitoring activities. As stated in the compliance guidance policy, "Registered entities can rely upon the example and be reasonably assured that compliance requirements will be met with the understanding that compliance determinations depend on facts, circumstances, and system configurations."

Proposed Requirement R1 provides flexibility for entities to develop a plan that includes procurement processes for various types of procurement activities including multi-party wide-area contracts, master agreements and piggyback agreements. The SDT believes that an exception is not needed because of the flexibility provided in the requirements. The SDT has revised the rationale to include types of procurement activities listed by the commenter among the other examples.

Requirement R1 Parts 1.2.5 and 1.2.6 address procurement processes related to software verification and vendor remote access, respectively. The proposed requirements in CIP-010-3 and CIP-005-6 are operational in nature and not related to procurement. Therefore the CIP-013 requirements are not duplicative of the CIP-010-3 and CIP-005-6 requirements. The SDT believes both operational controls and procurement related processes provide reliability benefit and are needed to address the directives in Order No. 829. The SDT is addressing the concern with potentially varying compliance interpretations by developing Implementation Guidance. The ERO Enterprise has endorsed the CIP-013-1 Implementation Guidance in accordance with NERC's Compliance Guidance policy. The ERO Enterprise's endorsement of the Implementation Guidance examples means the ERO Enterprise CMEP staff will give these examples deference when conducting compliance monitoring activities. As stated in the compliance guidance policy, "Registered entities can rely upon the example and be reasonably assured that compliance requirements will be met with the understanding that compliance determinations depend on facts, circumstances, and system configurations." The SDT agrees that the ERO roll-out strategy for CIP-013 following regulatory approval should include activities to help responsible entities develop and assess their plans and promote consistency in audit approaches.

Comment	
While in overall agreement with Requirements 1 through 3, ACEC does have the following concern: The R1 and R2 requirements in the draft split the development of one or more documented supply chain cyber security risk management plan(s) (R1) and the implementation of those supply chain cyber security risk management plan(s) specified in Requirement R1 (R2). By splitting these the potential for violations have been increased from one (1) to two (2) – one for each requirement. It is recommended that R1 and R2 be combined to reduce the potential of multiple violations for what should be a single Requirement. To illustrate, a majority of the Standards have their development of plans, processes, or procedures and implementation of those plans, processes, or procedures in the same requirement: CIP-002-5.1 R1; CIP-003-6 R2, R4; CIP-004-6 R1, R2, R3, R4, R5; CIP-005-5 R1, R2; CIP-006-6 R1, R2, R3; CIP-007-6 R1, R2, R3, R4, R5; CIP-010-2 R1, R2, R3, R4; CIP-011-2 R1, R2

Response. Thank you for your comment. In developing the 2nd draft of proposed CIP-013-1, the SDT separated requirements for responsible entities to develop and implement their Supply Chain Cyber Security Risk Management Plans. The SDT believes this approach to CIP-013-1 clarifies the obligations and more straightforward for responsible entities.

During the CIP-013-1 webinar on Feb 2, the SDT indicated several times that it is not the intention of R1 to force vendors to perform actions so that entities can comply with the standard. R1.2.1, R1.2.2, R1.2.3, R1.2.4 would force vendors to develop internal processes to notify entities of any changes relating to the requirements which would force vendors to take independent action to notify entities of any changes. Also, during the procurement phase, why would vendors reveal potential security flaws in their product above and beyond normal security patch notifications while they are competing against other vendors for the entities business? Also, entities have processes in place already for other CIP requirements to fully prepare an asset for deployment into the ESP. We don't grab equipment off of the back of the delivery truck and deploy it into the ESP immediately so what is the point of knowing about security flaws in their products during procurement? Any security flaws are probably already addressed with patches that will be downloaded and installed when preparing the asset for deployment. Also, a vulnerability assessment has to be performed against the asset and CIP-007/CIP-005 security controls have to be checked prior to deployment. 1.2.1, 1.2.2, 1.2.4, 1.2.5 appear to be redundant with CIP-007 R2 security patch management. Is the SDT expecting vendors to provide information about security/design flaws above and beyond the normal security patch notifications? If so, what kind of information would that be? 1.2.5 is troublesome as well (and it seems to be a duplicate of CIP-010-3 R1.6). Entities typically use update or proxy servers to discover and identify applicable security patches. For example, some use Windows Update Server Services to identify patches and roll them out	

once testing and approvals are complete. Do we need to check the check sums of the identified patches or can we trust that the update servers are authenticating the software?

Response. Thank you for your comment. The SDT believes the proposed requirement as written accomplishes the reliability objectives contained in the project SAR and FERC Order No. 829. The intent is for responsible entities to accomplish the objective by including the security topics contained in Requirement R1 Parts 1.2.1 – 1.2.6 in the entity's procurement processes, such as RFP or vendor negotiations. Consistent with the Order, the standard obligates responsible entities to address supply chain cyber security risk management without "directly impos[ing] obligations on suppliers, vendors or other entities that provide products or services to responsible entities" (P. 21). The note in Requirement R2 excludes contracts because they may contain business-sensitive information, and because the responsible entity may not be able to obtain all security provisions in Parts 1.2.1 – 1.2.6 with all vendors since the requirements cannot 'directly impose obligations on suppliers, vendors, or other entities". Requirement R1 Parts 1.2.5 and 1.2.6 address procurement processes related to software verification and vendor remote access, respectively. The approved requirements for security patch management in CIP-007 and proposed requirements in CIP-010-3 and CIP-005-6 are operational in nature and not related to procurement. Therefore the CIP-013 requirements are not duplicative of the CIP-010-3 and CIP-005-6 requirements. The SDT believes both operational and procurement related controls provide reliability benefit and are needed to address the directives in Order No. 829.

Comment	

There is a lack of consistency between R1 parts 1.2.1 and 1.2.4 with respect to the use of the terms. While part 1.2.1 uses the “vendor equipment” and “software,” part 1.2.4 uses the term “products.” The SDT should clarify if it intends “products” to be broader in scope than equipment and software. USI recommends that the SDT be consistent and use “vendor equipment” and “software” throughout, or provide additional clarification about the scope of the term “products.”

In R1 parts 1.2.1 and 1.2.2, the term “vendor-identified incident” is unclear. It could mean incidents that were identified by another party, specific to the products of a specific vendor. It could mean only incidents identified by the vendor. USI suggests changing “identified to “acknowledged” or “confirmed.”

Definition of vendor is not a NERC defined term. The term “vendor” is also used in the proposed CIP-005.

USI believes the SDT should provide guidance regarding the use of the term “vendor.” If “Vendor” is not defined by NERC, the Guidance should recommend that Entities include their definition of “vendor” in their plan(s).

Associated guidance in the “Rationale for R1” and in the separate implementation guidance should be revised to reflect the change to a performance-based requirement in which contract terms and contract negotiations play no function in auditing. Contract terms might be used by an entity as evidence of performance, but there should be no expectation by audits or subtext in the Standard or implementation guidance that anything having to do with contracts or procurement processes is required. There should be no expectation of what might or should be included within Requests for Proposals, no expectation of when contracts might or should be renegotiated, no expectations of what terms might or should be included or requested, and no expectations of what terms might or should be found in a prudent and proper contract. Ultimately there should be no expectation that such protections be achieved solely through the procurement process. Consistent with performance-based standards the objective is achieving each protection, not in how it is achieved.

Response. Thank you for your comment.

The SDT has addressed any inconsistent terms in parts 1.2.1 – 1.2.6 as appropriate.

The SDT does not believe changing 'identified' to 'confirmed' in part 1.2.1 provides additional clarity to the requirement. Responsible Entities have flexibility to tailor their supply chain cyber security risk management plans for clarity where deemed appropriate by the Responsible Entity. The SDT has provided a description of *vendor* in the rationale section. Rationale that is drafted during standards development remains part of the approved standard. The SDT does not agree that the guidance should recommend entities develop their own definition of vendor because entities can use the description that is included in the rationale. However, if an entity determines additional clarity is needed, they may provide such clarity in their supply chain cyber security risk management plan. Proposed CIP-013-1 contains *risk-based* requirements to mitigate cyber security risks to the BES in the supply chain of BES Cyber Systems in accordance with the project SAR and Order No. 829. The commenter's approach suggests removing the procurement and contracting process from the scope of the proposed standard. Such an approach would not meet the directives in Order No. 829, which direct NERC to develop standards to "require entities to develop and implement a plan that includes security controls for supply chain management" (P. 43) and to include certain procurement controls (P. 45). The intent is for responsible entities to accomplish the objective by including the security topics contained in Requirement R1 Parts 1.2.1 – 1.2.6 in the entity's procurement processes, such as RFP or vendor negotiations. Evidence could include RFPs or other procurement correspondence that demonstrate the responsible entity's cyber security risk management concepts and controls. Consistent with the Order, the standard obligates responsible entities to address supply chain cyber security risk management without "directly impos[ing] obligations on suppliers, vendors or other entities that provide products or services to responsible entities" (P. 21). .

ITC Holdings agrees with the proposed requirements, however, we believe the wording of CIP-013 leaves a lot of room for interpretation. We recommend being more prescriptive in the wording of CIP-013 as well as providing detailed guidance in the Technical Guidance document. Additionally, ITC Holdings agrees with the below comment submitted by SPP regarding the use of "coordination": 1.2.6- SPP requests clarification as to the "coordination" intended to be imposed, suggesting that the requirement may stand alone with the coordination component removed. SPP believes the "coordination of controls" may be interpreted as requiring the Responsible Entity and vendor to jointly develop and/or coordinate controls, rather than simply requiring the Responsible Entity to address the requisite remote access controls in its supply chain cyber security risk management plan(s). As drafted, SPP is concerned that it is unclear what is required for "coordination," as well as how such coordination would be evidenced at audit.

Response. Thank you for your comments. The SDT's intent with proposed CIP-013-1 is to address the reliability objectives in the project SAR and Order No. 829 in a non-prescriptive manner. To provide a clear example of compliance with the standard, the SDT developed Implementation Guidance what has been endorsed by the ERO Enterprise in accordance with NERC's Compliance Guidance policy.	

The ERO Enterprise-endorsed Implementation Guidance lists examples of compliant approaches to Requirement R1 Part 1.2, including 1.2.2 and 1.2.6. The SDT believes the standard and the examples in the Implementation Guidance provide the necessary clarity. Responsible Entities can provide additional detail in their Supply Chain Cyber Security Risk Management Plan.

Requirement R1. The IRC has no issues with the concept. We offer a recommendation on the language, "(i) Responsible Entity procures and installs vendor equipment and software; and (ii) Responsible Entity transitions from one vendor(s) product or service to another vendor(s) product or service".

Note: **ERCOT does not support the above comment.**

Requirement 1.2.1. The current wording suggests that the vendor has sufficient knowledge of the Responsible Entities' environment to know that a particular vulnerability does in fact pose a security risk to the Responsible Entity. We offer a recommendation on the language, *"Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that could pose cyber security risk to the Responsible Entity;"*

Requirement 1.2.2. The current phrase "coordination of response" is not clear as to what is intended by "coordination". We offer a recommendation on the language, *"Coordination of response activities by the vendor and the Responsible Entity to address vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;"*

Requirement 1.2.4. The current wording is not clear as to which vulnerabilities are applicable. We offer a recommendation on the language, *"Disclosure by vendors of known vulnerabilities in the procured product or service following a responsible disclosure process"."*

Requirement 1.2.6. The use of the phrase "Coordination of controls" is confusing. We offer a recommendation on the language, *"Controls for; (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s)."*

Response. Thank you for your comments. The SDT believes Parts 1.2.1 – 1.2.6 describe the cyber security risk topics that must be included in each responsible entity's Supply Chain Cyber Security Risk Management Plan for use in procuring BES Cyber Systems. Responsible entities can tailor specific wording in their plan to meet their procurement needs or to conform to the responsible entity's cyber security policies, plans, and practices.	
IESO	
Answer	No
Document Name	
Comment	
The IESO agrees in principle with the proposed requirements and respectfully submit suggestions for purposes of clarity. Requirement 1.2.1 We suggest the following wording change as the current wording suggests that the vendor has sufficient knowledge of the Responsible Entities' environment to know that a particular vulnerability does in fact pose a security risk to the Responsible Entity. Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that *could* pose cyber security risk to the Responsible Entity; Requirement 1.2.2 We suggest the following wording change as the current phrase "coordination of response" is not clear as to what is intended by "coordination". Coordination of response *activities by the vendor and the Responsible Entity* to address vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;	

Requirement 1.2.3 We suggest the following wording change as the current wording suggests that the Vendor has sufficient knowledge of the Responsible Entity to determine whether or not an individual should no longer be granted access. The Responsible Entity is the only party to an agreement that has the ability to determine who should or should not have access. *Circumstances where vendors should notify the Responsible Entity that access requirements of the vendor or third party personnel has changed.* Requirement 1.2.4 We suggest the following wording change as the current wording is not clear as to which vulnerabilities are applicable. Disclosure by vendors of known vulnerabilities *in the procured product or service;* Requirement 1.2.6 We suggest the following wording change as the use of the phrase “Coordination of controls” is confusing. Controls for; (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s).

2. The SDT developed proposed CIP-005-6 Requirement R2 Parts 2.4 and 2.5 to address the Order No. 829 directives for controls on vendor-initiated remote access to BES Cyber Systems covering both user-initiated and machine-to-machine vendor remote access. The SDT followed an approach recommended by stakeholders during the initial posting of CIP-013-1. Do you agree with proposed revisions in CIP-005-6? If you do not agree, or if you agree but have comments or suggestions, please provide your recommendation and explanation.

Elizabeth Axson - Electric Reliability Council of Texas, Inc. - 2	
Answer	No
Document Name	
Comment	

ERCOT joins the comments of the IRC and offers the following additional comments:

Regarding Part 2.4, ERCOT is concerned that the meaning of "determining" in the phrase "have one or more methods for determining active vendor remote access sessions" is unclear. If the SDT's intent is to require *identification* of instances of active vendor remote access, ERCOT suggests rewording to "have one or more methods of *identifying instances of* active vendor remote access (including Interactive Remote Access and system-to-system remote access)."

ERCOT also requests clarification on the meaning of "system-to-system remote access." Interpreted broadly, this requirement could mean all ingress/egress network connections to the security zone. Identifying each instance of connection could become extremely burdensome, without providing any meaningful reliability benefit.

ERCOT recommends that the meaning of system-to-system remote access be qualified as vendor remote access which can do harm to the BES Cyber System (BCS) and recommends the following language:

"Have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access). This is limited to sessions which have the ability to harm the BCS."

If the SDT declines to adopt this language, the SDT should consider defining "system-to-system remote access" or further clarifying the meaning of this term in the "Guideline and Technical Basis" section or in the Implementation Guidance.	
Likes 0	
Dislikes 0	
Response. Thank you for your comment. The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. The SDT does not believe replacing *determining* with *identifying instances* provides additional clarity. Requirement R2 Parts 2.4 and 2.5 address controls for remote access with vendors. Because Interactive Remote Access as defined in the NERC glossary is limited to "user-initiated access by a person", the SDT included system-to-system remote access with a vendor(s) in the requirement to meet the directive in Order No. 829 (P. 45). Taken together, *active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access)* covers all active remote access sessions with vendors. System to system remote access is any remote access that: (i)is permitted by the Responsible Entity according to Requirement R1 Part 1.3, (i) is not IRA, and (iii) occurs between the Responsible Entity and a vendor. The SDT does not support the suggested change to include the sentence *This is limited to sessions which have the ability to harm the BCS* because the sentence could be inconsistently interpreted. The SDT believes the measures provide a list of some methods that can achieve the reliability objective without excessive burden on the Responsible Entity. For example, methods for accessing logged or monitoring information to determine active vendor remote access sessions may leverage existing entity processes.

Comments:

The definition of vendor is crucial to an entity defining and carrying out its compliance objectives for the requirements in question.

Definition of vendor is not a NERC defined term. The term “vendor” is also used in the proposed CIP-013.

Request more guidance for the term “vendor” and use cases. Guidance should prompt Entities to include their definition of “vendor” in their plan(s).

Guideline & Technical Basis for R2 should be included in this update. Supplemental materials may be out of date – see page 21 of 24 in the posted redline version. Include reference to FERC Order 829 for Parts 2.4 and 2.5

Consider adding a CIP Exceptional Circumstance clause to R2 Parts 2.4 and 2.5

Likes 0	
Dislikes 0	

Response. Thank you for your comments.

The SDT has provided a description of *vendor* in the rationale section. Rationale that is drafted during standards development remains part of the approved standard.

The SDT included reference to FERC Order No. 829 in the rationale section for R2. This and other information in the rationale will become part of the supplemental material following NERC Board adoption of the proposed standard.

The SDT discussed the suggestion to consider adding CIP Exceptional Circumstance and did not believe this was necessary for reliability. Responsible entities can be expected to meet the obligations in Part 2.4 and 2.5.

Colby Bellville - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy	
Answer	No
Document Name	
Comment	

Duke Energy requests additional clarity pertaining to the use of the term “active” in Requirement 2 Parts 2.4 and 2.5. As written, it could be interpreted that an entity would be required to monitor the remote access sessions of a vendor in real-time. Was this the drafting team’s intent with this language? If the drafting team’s intent was that an entity only be able to identify which vendor’s have remote access, we suggest revising the standard to more closely reflect said intent. If it is the drafting team’s intent that an entity must monitor in real-time the remote access of a vendor, additional guidance as to acceptable methods to achieve compliance with this intent is necessary.

Likes 0	
Dislikes 0	

Response. Thank you for your comment.

The SDT’s intent for Requirement R2 Part 2.4 is for entities to have the ability to determine all remote access sessions with vendors that are taking place on their system at any point in time. Meeting this objective does not require monitoring of remote access sessions in real time. The examples of evidence included in the Measures for Part 2.4 indicate that this method does not require monitoring of individual remote access sessions with a vendor in real time. Examples listed in the measure include:

- *Methods for accessing logged or monitoring information to determine active vendor remote access sessions;*
- *Methods for monitoring activity (e.g. connection tables or rule hit counters in a firewall, or user activity monitoring) or open ports (e.g. netstat or related commands to display currently active ports) to determine active system to system remote access sessions; or*
- *Methods that control vendor initiation of remote access such as vendors calling and requesting a second factor in order to initiate remote access.*

Response. Thank you for your comment. The SDT believes the proposed Part 2.4 and 2.5 address the objectives contained in the project SAR and Order No. 829. These objectives are aimed at establishing controls on vendor remote access to BES Cyber Systems, covering both user-initiated and machine-to-machine vendor remote access, to mitigate potential risks of a compromise at a vendor during an active remote access session with a Responsible Entity from impacting the BES (P. 51). The SDT does not believe the requirement needs to include logging to meet the objective. The SDT also does not believe the suggested change in M2 to *actively* monitored information improves the clarity of the requirement or effectiveness in addressing the objective. Modifying Requirement R2 Part 2.3 to address technical feasibility is not in scope for Project 2016-03 per the project SAR.

CIP-005-6 R2 Part 2.4 as drafted does not identify the "direction" of how system-to-system remote access is initiated. Interactive Remote Access specifies that it originates "from a Cyber Asset that is not an Intermediate System and not located within any of the Responsible Entity's Electronic Security Perimeters". Without defining the system of origin or other defining controls, similar to the definition of Interactive Remote Access, any connection from a CIP Cyber Asset to a vendor system, even if one-way and simply for data acquisition/submission, could be interpreted as subject to this requirement. Additional clarification is requested.

Additionally, the Supplemental Material for the requirement points to a separate document without an official link. It appears this document has not been updated in six (6) years, and mostly targets securing Interactive Remote Access. It is requested that updated relevant material be placed in the Standard's Supplemental Material section, similar to other CIP standards, and that the Supplemental Material section also attempt to provide guidance on the securing of system-to-system remote access.

Response. Thank you for your comment.

Requirement R2 Parts 2.4 and 2.5 address controls for remote access with vendors. Because Interactive Remote Access as defined in the NERC glossary is limited to "user-initiated access by a person", the SDT included system-to-system remote access with a vendor(s) in the requirement to meet the directive in Order No. 829 (P. 45). Taken together, *active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access)* covers all active remote access sessions with vendors, regardless of origin. System to system remote access is any remote access that: (i)is permitted by the Responsible Entity according to Requirement R1 Part 1.3, (i) is not IRA, and (iii) occurs between the Responsible Entity and a vendor

The SDT has provided relevant information in the rationale section, which will become part of the supplemental material following NERC Board adoption of the proposed standard. The SDT believes Requirements R2 Part 2.4 and 2.5 and the accompanying measures, along with the rationale, provide the information necessary for entities to meet the reliability objective.

I fully support the concept of monitoring and being able to terminate all remote acccess sessions, however as written the additional requirements have no timing aspects associated with them, have no component for notification or alerting on active sessions, are atrifically limited to vendor access only, (lower case vendor) so may not include contractors, service providers, etc. Cannot support the requirement as written.

Dislikes 0	
Response. Thank you for your comments. The SDT believes the proposed requirements as written provide reliability benefit and address the Order No. 829 directives. Furthermore, CIP-005-6 Requirement R1 Part 1.5 provides a mechanism for Responsible Entities to determine when a response to suspicious activity in a vendor remote access session may be warranted. Part 1.5 requires Responsible Entities to have one or more methods for detecting known or suspected malicious communications for both inbound and outbound communications. Detections associated with this requirement could provide the triggering mechanism for Part 2.4.

With the deletion of the language in R2, it now appears that every Responsible Entity needs to have a documented process for Interactive Remote Access, even if the Responsible Entity does not allow it. Why did the team delete this exemption language from R2 as it seemed to lessen the burden for those entities that do not allow Interactive Remote Access?

Response. Thank you for your comment. The SDT developed Proposed CIP-005-6 Requirement R2 Parts 2.4 and 2.5 to address Order No. 829 directives for vendor remote access controls with input from the Project 2016-02 CIP Revisions SDT. The scope of the revised requirement R2 is expanded to address all remote access management, not just Interactive Remote Access. It is not the intent of the SDT to require entities to have documented processes for remote access if the entity does not allow remote access. The SDT has added clarification to the Rationale section.

The inclusion of (including Interactive Remote Access and system-to-system remote access) is problematic as the NERC defined term of Interactive Remote Access (IRA) explicitly excludes system-to-system process communication. Additionally, IRA already includes the concept of vendors (see 3) below).

"User-initiated access by a person employing a remote access client or other remote access technology using a routable protocol. Remote access originates from a Cyber Asset that is not an Intermediate System and not located within any of the Responsible Entity's Electronic Security Perimeter(s) or at a defined Electronic Access Point (EAP). Remote access may be initiated from: 1) Cyber Assets used or owned by the Responsible Entity, 2) Cyber Assets used or owned by employees, and 3) Cyber Assets used or owned by vendors, contractors, or consultants. Interactive remote access does not include system-to-system process communications."

The SDT should consider removing this system-to-system exclusion from the IRA defined term and stating Part 2.4 as –

Have one or more methods for determining active vendor Interactive Remote Access sessions.

And Part 2.5 as –

Have one or more method(s) to disable active vendor Interactive Remote Access sessions.

(note: the addition of 'sessions' in this Part to be consistent with Part 2.4.)

Lastly, from an SCRM perspective, the SDT should consider at least including some indication of when vendor remote access could or should be disrupted, but that may be better addressed in the CIP-013-1 R1.2.2 and/or R1.2.6 processes of the SCRM plan(s).

Response. Thank you for your comment. The SDT agrees that revising the definition of IRA could have met the objective. However because the scope and application of the IRA term is beyond the scope of Project 2016-03, the SDT decided to address the vendor remote access objectives by using the approved defined term and adding system-to-system vendor remote access in the requirements. Taken together, *active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access)* covers all active remote access sessions with vendors. The SDT believes CIP-005-6 Requirement R1 Part 1.5 provides a mechanism for Responsible Entities to determine when a response to suspicious activity in a vendor remote access session is warranted. Part 1.5 requires Responsible Entities to have one or more methods for detecting known or suspected malicious communications for both inbound and outbound communications.

Comment	

There needs to be a clear explanation of “machine-to-machine” and “system-to-system” remote access in the Guidelines & Technical Basis to provide the necessary understanding and scoping of these concepts for industry.

For example – “Machine-to-machine” or “system-to-system” remote access would include a logical connection between a High or Medium Impact BES Cyber System or it’s associated PCAs into or out of the associated ESP with a vendor-maintained Cyber Asset, and that connection does not have an interactive user access capability.

Additionally, under the Measures of R2.4, the statement of examples needs to have “such as” following “(including Interactive Remote Access and system-to-system remote access), such as:” to make it clearer that the below bulleted items are options an entity may choose from, and to be consistent with the formatting of R2.5.

Response. Thank you for your comment.

The SDT is including the following clarification of vendor remote access in the rationale section to support Requirement R2 Parts 2.4 and 2.5: *Active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) covers all active remote access sessions with vendors. System to system remote access is any remote access that: (i)is permitted by the Responsible Entity according to Requirement R1 Part 1.3, (i) is not IRA, and (iii) occurs between the Responsible Entity and a vendor.* The rationale section remains with the approved standard.

The SDT has made the suggested change to the Measure for Part 2.4.

The IRC agree with the new CIP-005-6 Requirement R2 Parts 2.4 and 2.5 however we note there is no corresponding "Guidance and Technical Basis" or "Rationale". We also suggest that guidance be drafted to help entities understand what is intended by the term "Vendor" in relation to parts 2.4 and 2.5. Regarding Part 2.4, the IRC is concerned that the meaning of "determining" in the phrase "have one or more methods for determining active vendor remote access sessions" is unclear. If the SDT's intent is to require *identification* of instances of active vendor remote access, the IRC suggests rewording to "have one or more methods of *identifying instances of* active vendor remote access (including Interactive Remote Access and system-to-system remote access)."	
Likes 0

Response. Thank you for your comment. The SDT has provided relevant information in the rationale section, which will become part of the supplemental material following NERC Board adoption of the proposed standard. Rationale includes a description of vendor. Upon adoption of the standard by the NERC Board of Trustees, this information will be transferred to the guidelines section of the standard. The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. The SDT does not believe replacing *determining* with *identifying instances* provides additional clarity.

Texas RE agrees with the proposed requirements and has the following comments.

- Question 2 above uses the term "*machine-to-machine vendor remote access*". CIP-013-1 and CIP-005-6 use the term ""system-to-system remote access". Since these are two different terms, Texas RE recommends these terms be defined or examples provided to increase clarity and to avoid multiple interpretations.
- Section 4.2.3.5 – The language, "*Each Responsible Entity shall implement develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber Systems*." is redundant with the requirement language. Also, neither CIP-013-1 nor CIP-010-3 contain this language in the Exemptions section.
- Page 1 Section 4.1.2.2 and Page 2 Section 4.2.1.2: Texas RE noted the term "*Special Protection System"* was removed. Texas RE recommends removing this term in all CIP standards.

The requirement in CIP-005-5 6 Table R2.4 states that an entity must have one or more processes to determine active vendor session. We would recommend adding 'Active and Passive' to the requirement since the Measures point to passive initiation in having the vendor call or receive permission before their remote access is granted. Additional guidance on what is 'Active' and whether the monitoring session requires tracking the entire session or initiation of the session would provide more clarity to industry.

David Ramkalawan - Ontario Power Generation Inc. - 5	
Answer	Yes
Document Name	
Comment	
OPG suggest the term "vendor" be defined to exclude outsourcers that manage most aspects of a BES Cyber System. Normally they are contractually obligated to act in the Responsible Entities interests and fulfill or accommodate all compliance requirements. As such, this is a much closer relationship than is typically associated with the term "vendor". Because in many such cases they would be principle maintainer or operator of said systems would often not technically feasible to disable the outsourcer's access, remote or otherwise. Requirement 2.4 mentions ability to determine "sessions", not just "access". Requirement 2.5 is ambiguous on whether it requires the ability to disable "active sessions" as opposed to merely disabling "active accounts". Suggest replacing "access" in R2.5 with either "sessions" or "accounts" depending on what was intended or otherwise elaborating.	

Likes 0	
Dislikes 0	

Response. Thank you for your comments.

Requirement R2 Parts 2.4 and 2.5 are intended to mitigate risks of a compromise at a vendor from traversing over a network connection and impacting BES Cyber Systems (Order No. 829 P. 52). Depending on the responsible entity's arrangements with the vendor, outsourcer management of a Responsible Entity's BES Cyber System may not be within the scope of Parts 2.4 and 2.5. These requirement parts apply to Interactive Remote Access with a vendor and system-to-system remote access with a vendor. The SDT has clarified in the rationale section that the phrase *active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access)* covers all active remote access sessions with vendors. System to system remote access is any remote access that: (i) is permitted by the Responsible Entity according to Requirement R1 Part 1.3, (ii) is not IRA, and (iii) occurs between the Responsible Entity and a vendor. The SDT believes that contractors performing functions such as staff augmentation in a manner similar to an entity's own employee would not fall within the scope of Part 2.4.

As stated in the rationale, the objective of Requirement R2 Part 2.5 is for entities to have the ability to disable active remote access sessions in the event of a system breach as specified in Order No. 829 (P. 52). The SDT believes the requirement and rationale are clear.

AZPS agrees with the inclusion of Parts 2.4 and 2.5 within CIP-005-6 R2; however, requests the statement “active vendor remote access sessions” be changed to “active vendor remote connection.” A vendor may sustain an active remote connection for longer than an individual active remote access session. Thus, a revision to the language would clarify the intent of this requirement, which is to monitor any time a vendor is connecting to and accessing sensitive cyber assets remotely. Thus, AZPS encourages the SDT to consider this revision as it will better ensure that active remote connections by vendors are monitored and addressed.

Response. Thank you for your comment. The SDT believes the added parts (Part 2.4 and 2.5) and associated measures, and the rationale section, identify the responsible entity’s obligations and provide flexibility for the responsible entity to meet the vendor remote access reliability objectives identified in the project SAR. The rationale section remains in the standard following approval. The SDT believes they	

have fulfilled the tasks in the SAR and are not intending to develop Implementation Guidance for CIP-005-6 Requirement R2 Parts 2.4 and 2.5. Per NERC's Compliance Guidance Policy, registered entities may develop examples or approaches for complying with Reliability Standard requirements and vet them through an approved organization for ERO Enterprise endorsement consideration. The SDT has provided a description of *vendor* in the rationale section and has clarified the meaning of *system-to-system*. Rationale that is drafted during standards development remains part of the approved standard. CIP-013-1 Requirement R1 Part 1.2.6 addresses procurement processes related to vendor remote access. The proposed requirements in CIP-005-6 are operational in nature and not related to procurement. Therefore the requirements are not duplicative. The SDT believes both operational controls and procurement related processes provide reliability benefit and are needed to address the directives in Order No. 829. The SDT included reference to FERC Order No. 829 in the rationale section for R2. This and other information in the rationale will become part of the supplemental material following NERC Board adoption of the proposed standard. The SDT discussed the suggestion to consider adding CIP Exceptional Circumstance and did not believe this was necessary for reliability. Responsible entities can be expected to meet the obligations in Part 2.4 and 2.5.

Response. Thank you for your comments. The SDT believes parts 2.4 and 2.5 describe two distinct reliability objectives which should remain separate for clarity.	
Allie Gavin - Allie Gavin On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1; - Allie Gavin	
Answer	Yes
Document Name	
Comment	
ITC Holdings agrees with the below comment submitted by MRO's NSRF: The NSRF question the use of "…*active* vendor…" in part 2.4 and 2.5 Requirements. The word "active" could mean either "the vendor is currently allowed electronic access and is currently within a BES Cyber Asset" OR "the vendor is idle and but has electronic access to a BES Cyber Asset". The NSRF recommends that "active" be removed as this will provide clarity to applicable entities. If active sessions was the SDT thought process, please state that within the proposed part.	
Likes 0	
Dislikes 0	
Response. Thank you for your comment. The SDT's intent for Requirement R2 Part 2.4 is for entities to have the ability to determine all remote access sessions with vendors that are taking place on their system at any point in time. Meeting this objective does not require monitoring of remote access sessions in real time. The examples of evidence included in the Measures for Part 2.4 indicate that this method does not require monitoring of individual remote access sessions with a vendor in real time. Examples listed in the measure include: • *Methods for accessing logged or monitoring information to determine active vendor remote access sessions;* • *Methods for monitoring activity (e.g. connection tables or rule hit counters in a firewall, or user activity monitoring) or open ports (e.g. netstat or related commands to display currently active ports) to determine active system to system remote access sessions; or* • *Methods that control vendor initiation of remote access such as vendors calling and requesting a second factor in order to initiate remote access.*

Response. Thank you for your comments.

The SDT has provided a description of *vendor* in the rationale section. Rationale that is drafted during standards development remains part of the approved standard.

Requirement R2 Parts 2.4 and 2.5 address controls for remote access with vendors. Because Interactive Remote Access as defined in the NERC glossary is limited to “user-initiated access by a person”, the SDT included system-to-system remote access with a vendor(s) in the

requirement to meet the directive in Order No. 829 (P. 45). The SDT has clarified in rationale that the phrase *active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access)* covers all active remote access sessions with vendors. System to system remote access is any remote access that: (i) is permitted by the Responsible Entity according to Requirement R1 Part 1.3, (ii) is not IRA, and (iii) occurs between the Responsible Entity and a vendor. The SDT included reference to FERC Order No. 829 in the rationale section for R2. This and other information in the rationale will become part of the supplemental material following NERC Board adoption of the proposed standard.

Does system to system remote access include “read-only” access or all forms of external access from vendors?	

Likes 0	
Dislikes 0	
Response. Thank you for your comments. Taken together, *active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access)* covers all remote access sessions with vendors. This includes 'read-only' access.

Comment	

The proposed CIP-005-6 uses vendor. Definition of vendor is not a NERC defined term. USI believes the SDT should provide guidance regarding the use of the term "vendor." If "Vendor" is not defined by NERC, the Guidance should recommend that Entities include their definition of "vendor" in their plan(s). The SDT should consider adding a CIP Exceptional Circumstance clause to R2 Parts 2.4 and 2.5

Comment	
As stated, this requirement seems to start with the base assumption that the Registered Entity allows vendors to have Remote Access to the Registered Entity's BES Cyber Assets with External Routable Connectivity (ERC), and therefore must implement a method to detect active vendor remote access session and have a method for disabling vendor access. Many Registered Entities do not allow vendors to have Remote Access to substation medium BES Cyber Assets. Would this relieve such REs from having to then develop a method to detect and disable active vendor remote access session and would documentation demonstrating that Vendor Remote Access was not allowed be sufficient?

The definition of “vendor” is important for defining and carrying out its compliance objectives for the requirements parts 2.4 and 2.5. The drafting team should add a part of one or both requirements to include a specific definition of vendor to support the related compliance procedures and evidence required of an entity.	

For Part 2.4, it is not clear if the requirement applies to contractors and service vendors that are provided authorized access under CIP-004. Additionally, more information is needed on the meaning of "active". Most of this is captured in logs after the fact. Does the drafting team intend for "active" to imply real-time information? Please clarify if the requirement only applies to a connection from the vendor directly to a system within the ESP or does it apply to connections from a vendor to a system outside the ESP that updates one inside the ESP. For Part 2.5, Oncor would like clarification of the action, or examples, for when access should be disabled.

Dislikes 0	

Response. Thank you for your comments.

The SDT has provided a description of *vendor* in the rationale section. Rationale that is drafted during standards development remains part of the approved standard.

Part 2.4 does not exclude contractors and service vendors that are provided access under CIP-004. Parts 2.4 and 2.5 are intended to mitigate risks of a compromise at a vendor from traversing over a network connection and impacting BES Cyber Systems (Order No. 829 P. 52). Depending on the responsible entity's arrangements, contractor and/or vendor management of a Responsible Entity's BES Cyber System may not be within the scope of Parts 2.4 and 2.5. These requirement parts apply to Interactive Remote Access with a vendor and system-to-system remote access with a vendor. The SDT has clarified in rationale that the phrase *active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access)* covers all active remote access sessions with vendors. System to system remote access is any remote access that: (i) is permitted by the Responsible Entity according to Requirement R1 Part 1.3, (ii) is not IRA, and (iii) occurs between the Responsible Entity and a vendor.

The SDT's intent for Requirement R2 Part 2.4 is for entities to have the ability to determine all remote access sessions with vendors that are taking place on their system at any point in time. Meeting this objective does not require monitoring of remote access sessions in real time. The examples of evidence included in the Measures for Part 2.4 indicate that this method does not require monitoring of individual remote access sessions with a vendor in real time. Examples listed in the measure include:

- *Methods for accessing logged or monitoring information to determine active vendor remote access sessions;*

- *Methods for monitoring activity (e.g. connection tables or rule hit counters in a firewall, or user activity monitoring) or open ports (e.g. netstat or related commands to display currently active ports) to determine active system to system remote access sessions; or*
- *Methods that control vendor initiation of remote access such as vendors calling and requesting a second factor in order to initiate remote access.*

CIP-005-6 Requirement R1 Part 1.5 could provide a mechanism for Responsible Entities to determine when a response to suspicious activity in a vendor remote access session may be warranted. Part 1.5 requires Responsible Entities to have one or more methods for detecting known or suspected malicious communications for both inbound and outbound communications. Detections associated with this requirement could determine when a responsible entity should disable vendor remote access.

SRP agrees with R2 Part 2.4 but requests clarification of the term “determining.”

SRP generally agrees with Proposed R2 Part 2.5 but requests revisions to the Rationale for R2. The last sentence of paragraph 2 of the rationale states the objective “…is for entities to have the ability to rapidly disable active remote access sessions…” The Responsible Entity may not have the capability to disable access during an “active” remote access session. SRP requests changing the language to “upon detected unauthorized activity.”

Likes 0	
Dislikes 0	

Response. Thank you for your comments.

The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. The word *determining* in this context describes actions that the responsible entity could take to meet the objective. The SDT has revised the rationale and removed the subjective term 'rapidly'. The objective of part 2.5 is for entities to have the ability to disable active remote access sessions.

Request to defined the scope of the requirements "for new contracts only"

With no defined scope, if the standard become effective in same time of the standard CIP-013-1, no terms will existed beetween entities and vendor in effective contracts. How the entities will comply to requirements ?

Definition of vendor is not a NERC defined term. The term "vendor" is also used in the proposed CIP-005.

Request more guidance for the term "active vendor remote access sessions" and use cases. Guidance should prompt Entities to include their definition of "vendor" in their plan(s).

Guideline & Technical Basis for R2 should be included in this update. Supplemental materials may be out of date – see page 21 of 24 in the posted redline version. Include reference to FERC Order 829 for Parts 2.4 and 2.5

Consider adding a CIP Exceptional Circumstance clause to R2 Parts 2.4 and 2.5

Likes 0	
Dislikes 0	

Response. Thank you for your comments. The SDT does not agree with limiting the scope to new contracts. The SDT believes responsible entities can and should meet the requirements upon implementation of the standard. The SDT has provided a description of *vendor* in the rationale section. Rationale that is drafted during standards development remains part of the approved standard. *Active* sessions refers to remote access sessions with vendors that are taking place on the responsible entity's system at any point in time. The SDT included reference to FERC Order No. 829 in the rationale section for R2. This and other information in the rationale will become part of the supplemental material following NERC Board adoption of the proposed standard. The SDT discussed the suggestion to consider adding CIP Exceptional Circumstance and did not believe this was necessary for reliability. Responsible entities can be expected to meet the obligations in Part 2.4 and 2.5.

SMUD agrees with R2 Part 2.4 but requests clarification of the term “determining.” SMUD generally agrees with Proposed R2 Part 2.5 but requests revisions to the Rationale for R2. The last sentence of paragraph 2 of the rationale states the objective “is for entities to have the ability to rapidly disable active remote access sessions…” The Responsible Entity may not have the capability to disable access during an “active” remote access session. SMUD requests changing the language to “upon detected unauthorized activity.” Clarification or formal definition of the term ‘vendor’ should be considered. ICCP and DNP3 traffic is routine system-to-system remote access between utilities, Operation and Maintenance vendors and other partners to provide reliability, without the term ‘vendor’ clarified, these protocols may fall into scope unnecessarily.

The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. The word *determining* in this context describes actions that the responsible entity could take to meet the objective.

The SDT has revised the rationale and removed the subjective term ‘rapidly’. The objective of part 2.5 is for entities to have the ability to disable active remote access sessions.

Anthony Jablonski - ReliabilityFirst - 10	
Answer	Yes
Document Name	

Comment
ReliabilityFirst agrees the changes to CIP-005-6 address directives from Federal Energy Regulatory Commission (FERC) Order No. 829 to develop a new or modified standard to address “supply chain risk management for industrial control system hardware, software, and

computing and networking services associated with bulk electric system operations." ReliabilityFirst offers the following specific comments for consideration.

1. Requirement R2 Part 2.3
    i. To be consistent with Parts 2.1 and 2.2 in the Standard, ReliabilityFirst offers the following modifications for consideration:
        a. [For all Interactive Remote Access sessions, require] multi-factor authentication.
2. Requirement R2 Part 2.4
    i. ReliabilityFirst believes more context should be placed around the term "determining". ReliabilityFirst offers the following modifications for consideration:
        a. Have one or more method(s) for [authorizing, monitoring, and logging] active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access).

Likes 0	
Dislikes 0	

Response. Thank you for your comments.

The SDT believes part 2.3 is clear as written.

The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. The word *determining* in this context describes actions that the responsible entity could take to meet the objective. The SDT believes the suggested wording could create overlapping obligations with some approved CIP requirements. The SDT prefers the drafted wording because it provides responsible entities with more flexibility to meet the objective.

Allan Long - Memphis Light, Gas and Water Division - 1

Answer	Yes

Response. Thank you for your comments. The SDT has provided a description of *vendor* in the rationale section. Rationale that is drafted during standards development remains part of the approved standard. The SDT discussed the suggestion to consider adding CIP Exceptional Circumstance and did not believe this was necessary for reliability. Responsible entities can be expected to meet the obligations in Part 2.4 and 2.5.	
Steven Sconce - EDF Renewable Energy - 5	
Answer	Yes
Document Name	
Comment	
A definition of “vendor” is necessary. This should be interpreted as any third-party that initiates a remote access session. Not every third-party is necessarily considered a “vendor” based on generally accepted definitions. With respect to the proposed Requirement 2 Part 2.4, additional details need to be provided on the expectations of “determining active vendor remote access sessions”. Two of the proposed measures state, “Methods for monitoring activity (e.g. connection tables or rule hit	

counters in a firewall, or user activity monitoring) or open ports (e.g. netstat or related commands to display currently active ports) to determine active system to system remote access sessions; **or** Methods that control vendor initiation of remote access such as vendors calling and requesting a second factor in order to initiate remote access." The former will be difficult to actively monitor for remote access. Remote access can be monitored, but this activity is too resource intensive to monitor in real-time. If it is necessary to actively monitor remote access in real-time then additional guidance is necessary. The latter is easily implemented. It is uncertain whether this requirement is expecting constant monitoring during the remote access session or just controlling access and logging the access. A more detailed expectation on the use of the reference tools is necessary.

Response. Thank you for your comments. The SDT has provided a description of *vendor* in the rationale section. Rationale that is drafted during standards development remains part of the approved standard. Some remote access, such as between NERC Registered Entities, is not considered in scope for Parts 2.4 and 2.5. The SDT's intent for Requirement R2 Part 2.4 is for entities to have the ability to determine all remote access sessions with vendors that are taking place on their system at any point in time. Meeting this objective does not require monitoring of remote access sessions in real time. However, a responsible entity could choose to monitor vendor remote access sessions in real time as a way to meet its obligation in Part 2.4.

We request clarification on whether “system-to-system” access applies to access that is “one-way” where the remote end conducts only monitoring activity and no control is possible, or whether the SDT intent is that any system-to-system access be included. We would suggest that the SDT add verbiage to the Guidelines and Technical Basis making the distinction for each type of “active vendor remote access sessions” that are included in this requirement (Interactive Remote Access, system-to-system remote access with control, and/or system-to-system remote access for monitoring only). Another suggestion would be to create a formal NERC definition of system-to-system access.	
Likes 0	
Dislikes 0	
Response. Thank you for your comment.	

Parts 1.2.6 addresses controls for remote access with vendors. Because Interactive Remote Access as defined in the NERC glossary is limited to “user-initiated access by a person”, the SDT included system-to-system remote access with a vendor(s) in the requirement to meet the directive in Order No. 829 (P. 45). The controls specified in Part 1.2.6 cover all remote access with vendors, which includes one-way remote access. System to system remote access is any remote access that: (i) is permitted by the Responsible Entity according to Requirement R1 Part 1.3, (i) is not IRA, and (iii) occurs between the Responsible Entity and a vendor.

The NSRF question the use of "…*active* vendor…" in part 2.4 and 2.5 Requirements. The word "active" could mean either "the vendor is currently allowed electronic access and is currently within a BES Cyber Asset" OR "the vendor is idle and but has electronic access to a BES Cyber Asset". The NSRF recommends that "active" be removed as this will provide clarity to applicable entities. If active sessions was the SDT thought process, please state that within the proposed part.

Response. Thank you for your comments.

The SDT's intent for Requirement R2 Part 2.4 is for entities to have the ability to determine all remote access sessions with vendors that are taking place on their system at any point in time. Meeting this objective does not require monitoring of remote access sessions in real time. The examples of evidence included in the Measures for Part 2.4 indicate that this method does not require monitoring of individual remote access sessions with a vendor in real time. Examples listed in the measure include:

- *Methods for accessing logged or monitoring information to determine active vendor remote access sessions;*
- *Methods for monitoring activity (e.g. connection tables or rule hit counters in a firewall, or user activity monitoring) or open ports (e.g. netstat or related commands to display currently active ports) to determine active system to system remote access sessions; or*
- *Methods that control vendor initiation of remote access such as vendors calling and requesting a second factor in order to initiate remote access.*

3. The SDT developed proposed CIP-010-3 Requirement R1 Part 1.6 to address the Order No. 829 directive for entities to address verification of software integrity and authenticity in the BES Cyber System environment (P 48). The SDT followed an approach recommended by stakeholders during the initial posting of CIP-013-1. Do you agree with proposed revisions in CIP-010-3? If you do not agree, or if you agree but have comments or suggestions for the proposed requirement, please provide your recommendation and explanation.

Comment	
Duke Energy requests additional guidance as to what constitutes acceptable verification of integrity as required by R1.6.2. The measure indicates that a change request record could demonstrate that source identity and integrity verification took place, but doesn't go into further detail as to what an acceptable check into source identity and software would be. Is there specific language that should be stated in the change request record that would clearly state the verification took place? More guidance on this aspect is requested. Also, Duke Energy requests that the Note under Applicable Systems in Part 1.6 should remain there once the standard is approved. The Note provides valuable details as to the true scope of the Requirement, and aids entities in knowing what will be the compliance expectation.

Comments:

The proposed requirement would possibly involve entities duplicating effort for every case for which such verification had to be undertaken (i.e. the cases of multiple installations of a given piece of software across many similar applicable Cyber Assets). This does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection. Request guidance on using trusted internal repositories as a software source so that Entity can verify once and use many

VSL does not cover the failure to implement the process. Does not include all of the combinations.

Concerns with 1.6.1 and 1.6.2 as written --- how to provide evidence? Request more examples of evidence

We suggest rephrasing “when the method to do so is available to the Responsible Entity from the software source” to “when the vendor supplied method to do so is available to Responsible Entity”. Otherwise the “method to do so” is ambiguous and leaves the following questions:

How does one prove that a method is not available?

What is the line between available/unavailable? How far do you have to go?

We are concerned with double jeopardy potential with CIP-007 R2. We feel that if it is impossible to validate the source or verify authenticity of the patch itself we would not consider that patch to be available.

Response. Thank you for your comments.

SDT added guidance to support use of software repositories so that integrity checks are not duplicated for each installation. Additional examples are included.

For all CIP-010 Requirement R1 parts, implementation of the specified processes is covered under existing Lower, Moderate, High, and Severe VSLs as a collective configuration change management process. The SDT believes it has integrated new Part 1.6 in a manner that is consistent with the other parts in approved CIP-010-2 Requirement R1.

An entity could demonstrate that a method to verify integrity is not available by providing documentation from the software source that shows the method to verify integrity is not provided, could provide evidence such as a screen shot that shows the methods described in the guidance section are not available, or an attestation.

The SDT included 'when a method to do so is available' to provide flexibility necessary to prevent disruption of an entity's software update and patch management processes. Part 1.6 does not impact an entity's ability and obligation to meet CIP-007 R2.

IESO	
Answer	No
Document Name	
Comment	
The IESO is concerned with two aspects of CIP-010-3 Requirement R1 Part 1.6: 1. The phrase “when the method to do so is available to the Responsible Entity from the software source” will be difficult to audit and difficult for the Responsible Entity to confirm as it is hard to prove a negative. The IESO suggest that verification of software source and integrity can take many different forms and is a sufficiently common practice that this phrase is not required. To take into consideration legacy software, the IESO suggest the wording be adjusted, to reflect FERC intentions that the requirements are forward looking, by replacing the phrase “and when the method to do so is available to the Responsible Entity from the software source” with “and, at a minimum, for the portion of the software that has changed:”	

2. There appears to be inconsistency between the requirement and the Guidelines.

The requirement states “For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5”.

The Guidelines and Technical Basis section heading Software and Authenticity, paragraph three on page 39, states: “It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches.”

The requirement wording suggests it applies for any change but the guidance suggests that for some changes, such as patches, it would not apply. As the requirement is auditable and the guidance is not, the guidance becomes superfluous. The Guideline also introduces significant ambiguity that is impossible to audit.

Therefor the IESO suggest that either the requirement wording be adjusted to allow for automated patching solutions or the Guideline be removed as it is contradictory. The IESO suggest that automated patch deployment solutions should be able to verify the identity and integrity of the patch. Therefore the best solution is to remove the guideline.

Response. Thank you for your comments.

SDT believes the phrase ‘when a method to do so is available’ provides responsible entities with necessary flexibility to perform configuration management obligations. Responsible entities have varying baselines, software vintages, and vendor support. Flexibility may be needed to prevent disruption of an entity’s software update and patch management processes.

The SDT has removed unclear statements from the guidelines section and added additional guidance.

The SDT revised the measure for Part 1.6 to provide an example of evidence to support automated solutions.

To avoid an interpretation of this requirement that may be overly burdensome, ERCOT suggests the following clarifications to the language in the requirement and measure of CIP-010-3 R1 Part 1.6. This would ensure a more holistic and less prescriptive approach to changes that deviate from the baseline. In the first sentence of Requirement R1.6, revise "For a change that deviates" to "Where technically feasible, for changes that deviate…" Revise the R1.6 Measure to read "An example of evidence may include, but is not limited to, a change request record that demonstrates the verification of identity of the software source and integrity of the software was performed during the baseline change, *or a process which documents the mechanisms in place that would automatically ensure the authenticity and integrity of the software."*

The language should make clear that verification is required for the software intake process, but not for each subsequent installation. We suggest rephrasing “when the method to do so is available to the Responsible Entity from the software source” to “when the vendor supplied method to do so is available to Responsible Entity”. Otherwise the “method to do so” is ambiguous and leaves the following questions: - How does one prove that a method is not available? - What is the line between available/unavailable? How far do you have to go? We are concerned with double jeopardy potential with CIP-007 R2. We feel that if it is impossible to validate the source or verify authenticity of the patch itself we would not consider that patch to be available.

Need clarification about how the addition of R1.6 applies only to BES Cyber Systems that are newly implemented and thus did not previously have a baseline and as such do not have an existing baseline to deviate from. Please clarify that this is for new BES Cyber Systems to avoid confusion and challenges during an aduit.

Need some additional examples of what constitutes evidence to meet compliance to this standard. Some systems are not connected to the internet purposefully and as such patches are installed utilizing a CD/DVD provided by the vendor. What would constitute appropriate evidence for a case such as this?

This requirement is not clear whether an entity has to duplicate efforts for every case for which such verification has to be undertaken (i.e. the cases of multiple installations of a given piece of software across many similar applicable Cyber Assets). This does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection. Request guidance on using trusted internal repositories as a software source so that an entity can verify once and apply to many assets.

Likes 0	
Dislikes 0	

Response. Thank you for your comments.

Part 1.6 applies to baseline changes after the effective date of the standard. The reliability objective is “intended to reduce the likelihood that an attacker could exploit legitimate vendor patch management processes to deliver compromised software updates of patches to a BES Cyber System” (P. 49). Performing software verifications as part of establishing the baseline is not in scope for Part 1.6. Baseline changes to the responsible entity’s high impact and medium impact BES Cyber Systems after the effective date of proposed CIP-010-3 are in scope (i.e., Part 1.6 is not limited to new BES Cyber Systems.)

SDT has provided additional technical considerations and examples in the guidance section, and revised the measure. SDT added guidance to support use of software repositories so that integrity checks are not duplicated for each installation.

Thomas Foltz - AEP - 5	
Answer	No

Comment	
Since the intent of CIP-010-3 R1.6 is a proactive verification of software integrity, R1.6 should focus on a single verification prior to introducing vendor software into the production environment. The current language of R1.6 utilizes a retroactive focus via baseline deviations. Please see the suggested wording - "Prior to introducing software not resident in baseline items (per 1.1.1, 1.1.2, and 1.1.5), and when the method to do so is available to the Responsible Entity from the software source: 1.6.1. Verify the identity of the software source; and 1.6.2. Verify the integrity of the software obtained from the software source."

Comment	

Proposed Requirement R1 Part 1.6 appears to require verification of identity and integrity of applicable changes to the baseline. However, the measure for this requirement gives an example of having a process, e.g., a change request record, instead of a specific example of verification. Can the team clarify the measure for this Requirement as an entity can have a change ticket process that merely requires the user to click a button that states that the software has been verified, however, if the team believes proof of such check, such as a screenshot of the vendor site, is required, please state such as an example. Additionally, the example of evidence does not demonstrate how a software source or the software integrity is verified. An internal change ticket is not a verification of the software source. If they are going to push for source verification then modify CIP-007 R2.1 to include it. Specifically, what is expected as evidence -- a hash, screenshot, attestation, digital signature?

Even though ReliabilityFirst believes the changes to CIP-010-3 draft standard address directives from Federal Energy Regulatory Commission (FERC) Order No. 829 and is a positive step in addressing cyber supply chain management, ReliabilityFirst Abstains mainly due to Requirement R1 missing Electronic Access Control or Monitoring Systems (EACMS), Physical Access Control Systems (PACS), and Protected Cyber Assets (PCAs). ReliabilityFirst offers the following specific comments for consideration. 1. Requirement R1 Part 1.6 2.	

i. ReliabilityFirst believes the "Applicable Systems" under Requirement R1 Part 1.6 should be consistent with "Applicable Systems" under parts 1.1, since sub-parts (Part 1.1.1, 1.1.2, & 1.1.5) are called out under the "Requirements" section for Part 1.6. EACMs and PACS are critical cyber assets that control access and monitoring into the entities' ESPs and PSPs and should follow the Supply Chain standard/requirements as do the High and Medium Impact Cyber Systems. As for the PCAs, if they are compromised due to a vulnerability in the vendors supplied hardware or software, they can possibly affect high and medium impact BES Cyber Systems. ReliabilityFirst offers the following modifications for consideration for the "Applicable Systems" column in Requirement R1 Part 1.6:

   a. High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA

   b. Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA

3. Requirement R1 Part 1.6.3 (new sub-part)

   i. ReliabilityFirst believes a new sub-part 1.6.3 should be added to address the verification of the baseline configuration. ReliabilityFirst offers the following new sub-part 1.6.3 for consideration:

      a. Verify the deviations from the baseline configuration.

Response. Thank you for your comments.

The SDT believes that Part 1.6 provides the intended reliability benefit, which applies to "industrial control system hardware, software, and services associated with bulk electric system operations" as specified in Order No. 829 (P. 43). The SDT believes entities should have flexibility to determine supply chain cyber security risk management controls for other cyber assets, including EACMS, PACS, and PCAs. The SDT believes this is an appropriate risk-based approach that allows entities to focus resources where they provide the most reliability benefit.

SDT believes there is reliability benefit to addressing the software integrity for changes from baseline configuration and that the requirement meets the directives in Order No. 829. The reliability objective is "intended to reduce the likelihood that an attacker could exploit legitimate vendor patch management processes to deliver compromised software updates of patches to a BES Cyber System" (P. 49). Verification of the integrity of the baseline configuration is not in scope.	
Patricia Robertson - BC Hydro and Power Authority - 1, Group Name BC Hydro	
Answer	No

Comment	

Ther is nothing wrong with the concept of the requiment however the language of the requirement is not supportable. The term available could me technically available, procedurally available, contracturaly available, freely available (no support purchase required). As written this requirement by its nature will be implemented and assessed drastically differently by different Responsible Entities. One could argue that only if all the available methods listed above exist in unison is software actually available.	
Likes 0	
Dislikes 0	
Response. Thank you for your comment. SDT has provided additional information in the guidance section. *Available from the software source* is not intended to be limited to contract terms. The SDT believes this wording is necessary to provide entities with flexibility and avoid disrupting software update and patch management processes in some situations.	
Tho Tran - Oncor Electric Delivery - 1 - Texas RE	
Answer	No
Document Name	
Comment	
There are auditing challenges around the phrase “when the method to do so is available to the Responsible Entity from the software source” as it is hard to prove a negative. Oncor believes that verification of software source and integrity can take many forms. To take into consideration legacy software, Oncor believes the wording should be adjusted, to reflect FERC intentions that the requirements are forward looking, by replacing the phrase *“and when the method to do so is available to the Responsible Entity from the software source”* with *“and, at a minimum, for the portion of the software that has changed:”* Second, the proposed requirement would possibly involve entities duplicating effort for every case for which such verification had to be undertaken (i.e. the cases of multiple installations of a given piece of software across many similar applicable Cyber Assets). We offer a recommendation on the language, *“Document and implement a software source management process to address source identity*	

verification and media integrity controls on the software repository used for changes that deviate from the existing baseline configuration associated with items in parts 1.1.1, 1.1.2, and 1.1.5." *This process must include steps:* *• To verify the identity of the software source when the method to do so is available; and* *• To verify the integrity of the software obtained when the method to do so is available.* *Evidence may include verification of identity of the software source and integrity of the software was performed for repository updates."*

Comment	
NPPD supports the comments of the MRO NSRF, in addition: Auditors will have too much discretion as to what is or is not enough for a validation check of each vendor, which will lead to inconsistencies across the NERC RE footprint. It is up to entities to document what the vendor is willing to do and hope the auditors agree it is enough to continue doing business with the vendor. Also, the language of the requirement says "…when the method to do so is available…". If a vendor does not have a method to do so, but does in the next year or so, the entity may have a possible violation if it did not realize there was a change in the vendor's available methods. This would force entities to periodically check to see if the vendor capabilities have changed. What is the period that would not make this a violation? The requirement is very vague.

The proposed requirement would possibly involve entities duplicating effort for every case for which such verification had to be undertaken (i.e. the cases of multiple installations of a given piece of software across many similar applicable Cyber Assets). This does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection. Request guidance on using trusted internal repositories as a software source so that Entity can verify once and use many. Concerns with 1.6.1 and 1.6.2 as written --- how to provide evidence? Request more examples of evidence. We support these changes, but requests clarification about how new R1.6 applies to entirely new BES Cyber Systems (BCS), i.e., BCS that are newly implemented, have not previously had a baseline, and thus do not have an existing baseline for a change to deviate from. We expect that R1.6 is intended to apply to new BCS as well as to existing BCS, but as written the requirement does not. Please clarify to avoid implementation confusion and audit challenges.

Response. Thank you for your comments.

The SDT added guidance to support use of software repositories so that integrity checks are not duplicated for each installation. Technical considerations and examples associated with Part 1.6.1 and Part 1.6.2 are included.

Part 1.6 applies to baseline changes after the effective date of the standard. The reliability objective is "intended to reduce the likelihood that an attacker could exploit legitimate vendor patch management processes to deliver compromised software updates of patches to a BES Cyber System" (P. 49). Performing software verifications as part of establishing the baseline (e.g., implementing a new BES Cyber System) is not in scope for Part 1.6.

Request clarification on how an Entity can verify the 'integrity and authenticity' one time and then be able to install on multiple devices.

Recommend removing CIP-013 R1 subparts 1.2.5 from CIP-013 since it is covered in the proposed CIP-010-3

The proposed requirement would possibly involve entities duplicating effort for every case for which such verification had to be undertaken (i.e. the cases of multiple installations of a given piece of software across many similar applicable Cyber Assets). This does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection. Request guidance on using trusted internal repositories as a software source so that Entity can verify once and use many

VSL does not cover the failure to implement the process. Does not include all of the combinations.

Concerns with 1.6.1 and 1.6.2 as written --- how to provide evidence? Request more examples of evidence

We suggest rephrasing “when the method to do so is available to the Responsible Entity from the software source” to “when the vendor supplied method to do so is available to Responsible Entity”. Otherwise the “method to do so” is ambiguous and leaves the following questions: How does one prove that a method is not available? What is the line between available/unavailable? How far do you have to go? We are concerned with double jeopardy potential with CIP-007 R2. We feel that if it is impossible to validate the source or verify authenticity of the patch itself we would not consider that patch to be available.

Response. Thank you for your comments.

The SDT added guidance to support use of software repositories so that integrity checks are not duplicated for each installation. Technical considerations and examples associated with Part 1.6.1 and Part 1.6.2 are included.

CIP-013-1 Requirement R1 Part 1.2.5 addresses procurement processes related to software verification. The proposed requirement in CIP-010-3 is operational in nature and not related to procurement. Therefore the CIP-013 requirement is not duplicative of the CIP-010-3 requirement. The SDT believes both operational controls and procurement related processes provide reliability benefit and are needed to address the directives in Order No. 829.

For all CIP-010 Requirement R1 parts, implementation of the specified processes is covered under existing Lower, Moderate, High, and Severe VSLs as a collective configuration change management process. The SDT believes it has integrated new Part 1.6 in a manner that is consistent with the other parts in approved CIP-010-2 Requirement R1.

Part 1.6 provides responsible entities with flexibility to meet the reliability objective. A responsible entity could use a verification method that is provided by the vendor, or another method that is available. Techniques described in the guidelines and technical basis section are not limited to those provided by the software’s vendor. An entity could demonstrate that a method to perform verification is not

available by providing documentation from the software source, evidence such as a screen shot that shows the methods described in the guidance section are not available, or an attestation. The SDT included 'when a method to do so is available' to provide flexibility necessary to prevent disruption of an entity's software update and patch management processes. Part 1.6 does not impact an entity's ability and obligation to meet CIP-007 R2.

To ensure that resources are appropriately focused on changes to be applied, AZPS recommends clarifying that verification should be completed "prior to application of a change." Such a clarification will signal to entities that verification only needs to be performed where a change will be applied and avoid circumstances where a change is being evaluated for application and verification occurs, but the change is not applied. Under the current obligation, it is likely that verifications and associated evidence would be prepared regardless of whether the change is or is not applied and would therefore result in the dedication of resources to efforts that would have no benefit to reliability or security. Additionally, AZPS requests clarification regarding the continued need for verification evidence where such is not available from the vendor. Specifically, AZPS notes that, where a vendor's policy does not provide the necessary evidence associated with verification, this Requirement may frequently represent null evidence for areas where items are reviewed each time a change occurs, but no data is available due to the vendor's policies. Such efforts would be redundant and of little or no value to security and reliability.

Add language to address CIP Exceptional Circumstances.	
Likes 0	
Dislikes 0	
Response. Thank you for your comment. The SDT discussed the suggestion to add CIP Exceptional Circumstance and did not believe this was necessary for reliability. The SDT believes the steps for verifications, when methods are available, can be implemented in emergent and non-emergent scenarios. Furthermore, responsible entities are not obligated to perform verifications when a method to perform the verifications is not available.

OPG suggest that 1.6.1 state "Verify the software originated from the vendor's official source(s)". In the current text, even if a source has an "identity", it should also state the "identity" is the one that is expected. Similarly we can change the word "identity" with "correct identity" in R1 Part 1.6.1.	

Likes 0	
Dislikes 0	
Response. Thank you for your comment. SDT agrees that verifying identity of source means that the software is being obtained from the correct source. The SDT believes the additional information provided in the guidance section clarify the intent.

By adding the "when the method to do so is available to the Entity from the software source" does this require the entity to document and detail what method is available of not available? How does that entity prove and document this condition? Does the entity have to document and prove that it was tested and verified for software integrity and authenticity? If so, what are those requirements, documentation, testing environment required and timeline for testing the software?

EPE understands the need for software integrity and authenticity; however, the proposed wording of the standard is not sufficiently clear with respect to the action/conduct being sought by the Registered Entity in order to achieve compliance. In Order No. 829, FERC offered clarity that the proposed requirement does not capture. There, FERC stated:

For example, in the System and Information Integrity (SI) control family, control SI-7 suggests that the integrity of information systems and components should be tested and verified using controls such as digital signatures and obtaining software directly from the developer. In the Configuration Management (CM) control family, control CM-5(3) requires that the information system prevent the installation of firmware or software without **verification that the component has been digitally signed** to ensure that hardware and software components are genuine and valid. NIST SP-800-161, while not meant to be definitive, provides **examples of controls for addressing the Commission's directive regarding this first objective. Other security controls also could meet this objective.** Order No 829 at P 50 (emphasis added).

Requirement 1.6 should be adjusted to provide the type of clarity FERC provided in the Order. An additional sentence or parenthetical should be included within the requirement, to read ("Verification that a patch or other software component has been digitally signed is one way to meet this requirement; other security controls could also meet this requirement, such as having the vendor state in writing that it will verify the integrity and authenticity of all software, including patches, in advance of releasing it to the Registered Entity during the life of its service contract with the Registered Entity").

The addition of such language *in the requirement itself* is consistent with the feedback offered by NERC Staff in recent months, and would eliminate the false impression that would otherwise be given that a Registered Entity must secure a verification letter from its software vendor each and every single time it seeks to download a patch. For example, during the NERC webinar held on May 18, 2017, examples were provided to the attendees on information that would be considered sufficient evidence to fulfill this requirement, and such examples included a letter from the vendor indicating that the vendor is verifying integrity and authenticity of its software before releasing its software (including patches) to its clients.

Additional examples of acceptable evidence would be helpful under the Measures column of the requirement.

Change the statement in the Guidelines and Technical Basis, Section Software Integrity and Authenticity, paragraph 1, third sentence: "The intent of the SDT is to provide controls for verifying the baseline elements that are *updated* by vendors." to say "… *provided* by vendors." Additional clarity is needed regarding the following in the Guidelines and Technical Basis: "It is not the intent of the SDT to require a verification of each source *or software update at the time it is obtained*. It is sufficient to *establish the reliable source and software update once*. This will allow automated solutions to be implemented to obtain frequent updates such as patches." This is confusing because saying "each source or software update" is not required to be validated at the time it is obtained could be interpreted to mean continuous patch updates provided by a single vendor are only required to be verified once for the lifetime of the supply of patches from that vendor. Additional examples of acceptable methods and evidence are needed in the Guidelines and Technical Basis for performing software integrity and authenticity. For example – Consider having the measures for R1.6 be similar to R1.1.

Likes 0	
Dislikes 0	

Response. Thank you for your comments. The SDT revised the Measure for Part 1.6 to more clearly include automated processes for verifications. The SDT has added details to the guidelines section to provide technical considerations and examples that will improve the clarity of the standard. The SDT believes the suggested change of *updated* to *provided* could confuse some responsible entities because the requirement applies to baseline changes only; therefore the SDT does not support the wording change. SDT added guidance in the guidelines section to support use of software repositories so that integrity checks are not duplicated for each installation. In doing so, the SDT removed ambiguous information from the guidelines section.

We request clarification on the timing of requirement 1.6; specifically, on whether 1.6 must be completed before being placed in operation on a BES Cyber System. This distinction was made in the previous draft ("one or more documented process(es) for verifying the integrity and authenticity of the following software and firmware before being placed in operation on high and medium impact BES Cyber Systems"). Under the current language, it appears sub-requirement 1.6 could be done before or after the software is placed on a BES Cyber System. We suggest the SDT add a timeframe similar to the other CIP-010 R1 sub-requirements. For example, 1.3 states "within 30 days" while 1.4.1 states "prior to the change". Additionally, we request adding 1.1.3 (any custom software installed) to 1.6, as custom software could be internally or externally provided, and needs to be verified for integrity and authenticity.

Need to emphasize the phrase “and when the method to do so is available to the Responsible Entity for the software source”. Since this is a non-prescriptive requirement it is expected that we will be demonstrating compliance by implementing the plan(s) required in CIP-013. Since it may not be possible to hold the software resource directly responsible it is expected that the demonstration of “best effort” will be sufficient and not subject to interpretation by the Compliance Enforcement Authority. Recommend providing more examples of suitable evidence that should be gathered to verify identity and integrity. The Measure as currently written is too vague.

Comment	

PRPA agrees this requirement belongs in CIP-010 R1. PRPA generally agrees with Proposed R1 Part 1.6, but request the following items be addressed by the SDT:

- PRPA recommends the Guidelines and Technical Basis section is updated to reflect current information.
    - The requirement states "For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5…," indicating the authenticity and integrity of the specified parts need to be verified each time there is a change to a baseline for those parts. The proposed requirement would possibly involve entities duplicating effort for every case for which such verification had to be undertaken (i.e., in the cases of multiple installations of software across many applicable Cyber Assets). This does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection. We believe that the existing statement in the GTB provides clarity on this issue and request that it not be removed. From the GTB: "It is not the intent of the SDT to require a

verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches."

- PRPA also recommends the language of the requirement be re-worded to reflect the intent of the GTB, as an auditor audits to the requirement, not the GTB. Doing a verification of authenticity and integrity for each change to the baseline for the specified parts would be tedious and require entities to acquire additional resources to perform the work.

- There is no guidance on how to verify the identity (authenticity). Performing this verification could be difficult if the software/patch comes from a third party tool. Guidance on how this can be done needs to be made available to entities in order to perform an evaluation of the work and resources involved to achieve this requirement. Hashing was given as an example during an industry webinar, but this is not realistic for each type of system.
- Additional examples of acceptable measures should to be listed. Additionally, PRPA requests examples of acceptable evidence when there is not a method available to verify the identity of the software source.
- While PRPA supports these changes, clarification is required about how new R1.6 applies to entirely new BES Cyber Systems (BCS), i.e., BCS that are newly implemented, have not previously had a baseline, and thus do not have an existing baseline for a change to deviate from. We expect that R1.6 is intended to apply to new BCS as well as to existing BCS, but as written the requirement does not. Please clarify to avoid implementation confusion and audit challenges.

Response. Thank you for your comments.

SDT added guidance in the guidelines section to support use of software repositories so that integrity checks are not duplicated for each installation. Other details were also added to the guidelines section to provide technical considerations and examples for meeting Part 1.6.1 and 1.6.2 that will improve the clarity of the standard. The SDT believes Part 1.6 and the associated measure provide responsible entities the ability to implement the verification process in a manner that is consistent with the guidelines section and avoids duplicating efforts as written.

An entity could demonstrate that a method is not available by providing documentation from the software source that shows methods are not provided, evidence such as a screen shot that shows the methods described in the guidance section are not available, or an attestation. Part 1.6 applies to baseline changes after the effective date of the standard. The reliability objective is “intended to reduce the likelihood that an attacker could exploit legitimate vendor patch management processes to deliver compromised software updates of patches to a BES Cyber System” (P. 49). Performing software verifications as part of establishing the baseline (e.g., for a new BES Cyber System) is not in scope for Part 1.6.

The Guidelines and Technical Basis of CIP-010-3 states: “It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches.” CenterPoint Energy recommends incorporating this concept in the R2 requirement language in order to clarify that integrity and authenticity do not need to be verified for every source or software update, and that the download once and install on many approach is acceptable if the integrity and authenticity of the downloaded software are validated. CenterPoint Energy recommends adding the following language to Requirement R2: Upon validation of the integrity and authenticity of software, a Responsible Entity does not need to verify the integrity and authenticity for subsequent updates of such software.	
Likes 0

SMUD agrees this requirement belongs in CIP-010 R1. SMUD generally agrees with Proposed R1 Part 1.6, but request the following items be addressed by the SDT:

- SMUD recommends the Guidelines and Technical Basis section is updated to reflect current information.
    -
        - The requirement states “For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5…,” indicating the authenticity and integrity of the specified parts need to be verified each time there is a change to a baseline for those parts. The proposed requirement would possibly involve entities duplicating effort for every case for which such verification had to be undertaken (i.e., in the cases of multiple installations of software across many applicable Cyber Assets). This does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection. We believe that the existing statement in the GTB provides clarity on this issue and request that it not be removed. From the GTB: “It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches.”

- SMUD also recommends the language of the requirement be re-worded to reflect the intent of the GTB, as an auditor audits to the requirement, not the GTB. Doing a verification of authenticity and integrity for each change to the baseline for the specified parts would be tedious and require entities to acquire additional resources to perform the work.

- There is no guidance on how to verify the identity (authenticity). Performing this verification could be difficult if the software/patch comes from a third party tool. Guidance on how this can be done needs to be made available to entities in order to perform an evaluation of the work and resources involved to achieve this requirement. Hashing was given as an example during an industry webinar, but this is not realistic for each type of system.
- Additional examples of acceptable measures should to be listed. Additionally, SMUD requests examples of acceptable evidence when there is not a method available to verify the identity of the software source.
- While SMUD supports these changes, clarification is required about how new R1.6 applies to entirely new BES Cyber Systems (BCS), i.e., BCS that are newly implemented, have not previously had a baseline, and thus do not have an existing baseline for a change to deviate from. We expect that R1.6 is intended to apply to new BCS as well as to existing BCS, but as written the requirement does not. Please clarify to avoid implementation confusion and audit challenges.

Response. Thank you for your comments.

SDT added guidance in the guidelines section to support use of software repositories so that integrity checks are not duplicated for each installation. Other details were also added to the guidelines section to provide technical considerations and examples for meeting Part 1.6.1 and 1.6.2 that will improve the clarity of the standard. The SDT believes Part 1.6 and the associated measure provide responsible entities the ability to implement the verification process in a manner that is consistent with the guidelines section and avoids duplicating efforts as written.

An entity could demonstrate that a method is not available by providing documentation from the software source that shows methods are not provided, evidence such as a screen shot that shows the methods described in the guidance section are not available, or an attestation. Part 1.6 applies to baseline changes after the effective date of the standard. The reliability objective is "intended to reduce the likelihood that an attacker could exploit legitimate vendor patch management processes to deliver compromised software updates of patches to a BES Cyber System" (P. 49). Performing software verifications as part of establishing the baseline (e.g., for a new BES Cyber System) is not in scope for Part 1.6.

AE agrees this requirement belongs in CIP-010 R1 and generally agrees with Proposed R1 Part 1.6, but request the SDT address the following items:

AE recommends the Guidelines and Technical Basis section be updated to reflect current information.

The requirement states "For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5…," indicating the authenticity and integrity of the specified parts must be verified each time a baseline changes for those parts. The proposed requirement would possibly involve entities duplicating effort for every case for which such verification had to occur (e.g., in the cases of multiple installations of software across many applicable Cyber Assets). This requirement does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection. We believe the existing statement in the GTB provides clarity on this issue and request it not be removed. From the GTB: "It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches."

o AE also recommends rewording the language of the requirement be re-worded to reflect the intent of the GTB, as an auditor audits to the requirement, not the GTB. Doing a verification of authenticity and integrity for each change to the baseline for the specified parts would be tedious and require entities to acquire additional resources to perform the work. o There is no guidance on how to verify the identity (authenticity). Performing this verification could be difficult if the software/patch comes from a third party tool. Guidance on how this can be done needs to be made available in order to perform an evaluation of the work and resources involved to achieve this requirement. Hashing was given as an example during an industry webinar, but this is not realistic for each type of system. o Additional examples of acceptable measures should to be listed. Additionally, AE requests examples of acceptable evidence when there is no method available to verify the identity of the software source. While AE supports these changes, clarification is required about how R1.6 applies to entirely new BES Cyber Systems (BCS), i.e., BCS newly implemented and which have no previous baseline, and thus do not have an existing baseline from which a change can occur. We expect R1.6 is intended to apply to new BCS as well as to existing BCS but, as written, the requirement does not. Please clarify to avoid implementation confusion and audit challenges.

Request to defined the scope of the requirements "for new contracts only" With no defined scope, if the standard become effective in same time of the standard CIP-013-1, no terms will existed beetween entities and vendor for effective contracts. How the entities will be conformed to requirements ? The proposed requirement would possibly involve entities duplicating effort for every case for which such verification had to be undertaken (i.e. the cases of multiple installations of a given piece of software across many similar applicable Cyber Assets). This does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection. VSL does not cover the failure to implement the process. Does not include all of the combinations. Concerns with 1.6.1 and 1.6.2 as written --- how to provide evidence? Request more examples of evidence.

Response. Thank you for your comments.	

The SDT does not agree with limiting the scope to new contracts. The SDT believes responsible entities can and should meet the requirements upon implementation of the standard. SDT added guidance in the guidelines section to support use of software repositories so that integrity checks are not duplicated for each installation. Other details were also added to the guidelines section to provide technical considerations and examples for meeting Part 1.6.1 and 1.6.2 that will improve the clarity of the standard. The SDT believes Part 1.6 and the associated measure provide responsible entities the ability to implement the verification process in a manner that is consistent with the guidelines section and avoids duplicating efforts as written. For all CIP-010 Requirement R1 parts, implementation of the specified processes is covered under existing Lower, Moderate, High, and Severe VSLs as a collective configuration change management process. The SDT believes it has integrated new Part 1.6 in a manner that is consistent with the other parts in approved CIP-010-2 Requirement R1.

Response. Thank you for your comments. The SDT does not believe that it is necessary to include this phrase in CIP-013-1 Requirement R1 Part 1.2. because CIP-013-1 addresses the responsible entity's procurement processes. CIP-013 does not impose obligations on vendors, nor does it obligate the responsible entity to specific terms or conditions in a contract.

The NSRF has the same comment from CIP-013-1 R1: CIP-010-3 R1.6 is troublesome as well. Entities typically use update or proxy servers to discover and identify applicable security patches. For example, we use Windows Update Server Services to identify patches and roll them out once testing and approvals are complete. Do we need to check the check sums of the identified patches or can we trust that the update servers are authenticating the software?

R1.6 brings to mind several challenges. The intent appears to be to ensure that software is validated, which is not the issue. The issue is the auditability of the requirement and its existing language. The wording "when the method to do so is available" puts additional obligations on the Responsible Entity to prove whether the methods were available or not, when the methods were available, if it was appropriate to utilize the available methods in a given circumstance. It adds additional nuance when the methods are often obtained from third parties. If it is a legacy contract and has not been updated and the method is available to other entities but not to the Responsible Entity due to the legacy contract, is the method considered available? The intent of this requirement is good but the auditability of the language is challenging at best and should be adjusted to consider how entities will be able to document and comply with the requirement language.

NRG recommends that the drafting team provide examples to provide clarity on control design to meet the intent of the standard.

The proposed requirement would possibly involve entities duplicating effort for every case for which such verification had to be undertaken (i.e. the cases of multiple installations of a given piece of software across many similar applicable Cyber Assets). This does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection. NRG requests guidance on using trusted internal repositories as a software source so that Entity can verify once and use many

The VSL as currently written may not cover the failure to implement the process. The VSL may not include all of the combinations.

NRG has concerns with Parts: 1.6.1 and 1.6.2 as written --- For example, how would a Registered Entity be expected to provide evidence? NRG request additional examples of evidence in the Measures section of the requirement.

NRG suggests rephrasing “when the method to do so is available to the Responsible Entity from the software source” to “when the vendor supplied method to do so is available to Responsible Entity”. Otherwise the “method to do so” may be ambiguous and leaving the following questions:

How does one prove that a method is not available?

What is the line between available/unavailable? How far do you have to go?

NRG is concerned with double jeopardy potential with CIP-007 R2. NRG is concerned that it may be difficult or impossible to validate the source or verify authenticity of the patch itself which may cause the industry to not consider that patch to be available.

Response Thank you for your comments. The SDT added details to the guidelines section that provide technical considerations and examples for meeting Part 1.6.1 and 1.6.2. This includes guidance to support use of software repositories so that integrity checks are not duplicated for each installation. For all CIP-010 Requirement R1 parts, implementation of the specified processes is covered under existing Lower, Moderate, High, and Severe VSLs as a collective configuration change management process. The SDT believes it has integrated new Part 1.6 in a manner that is consistent with the other parts in approved CIP-010-2 Requirement R1. Part 1.6 provides responsible entities with flexibility to meet the reliability objective. A responsible entity could use a verification method that is provided by the vendor, or another method that is available. Techniques described in the guidelines and technical basis section are not limited to those provided by the software's vendor. An entity could demonstrate that a method to perform verification is not available by providing documentation from the software source, evidence such as a screen shot that shows the methods described in the guidance section are not available, or an attestation. The SDT believes the phrase 'when a method to do so is available' provides responsible entities with the flexibility necessary to prevent disruption of their software update and patch management processes. Thus, Part 1.6 does not impact an entity's ability and obligation to meet CIP-007 R2.

Comment	

ITC Holdings believes the wording of CIP-010-3 leaves a lot of room for interpretation and needs to be more prescriptive. The measures should define technical examples (e.g., denote MD5 fingerprint or hashing as being an acceptable method). Additionally, ITC recommends including Remedy in the Technical Guidance document if you can't use the file integrity method.

Texas RE notes that the proposed standard is not responsive to the FERC directive. FERC Order No. 829 P. 59 specifically states "The new or modified Reliability Standard must address the provision and verification of relevant security concepts *in future contracts* for industrial control system hardware, software, and computing and networking services associated with bulk electric system operations." The Note in Part 1.6, however, states: "Additionally, the following issues are beyond the scope of Part 1.6: (1) the actual *terms and conditions of a procurement contract*; and (2) vendor performance and adherence to a contract." Texas RE agrees that it is unreasonable to hold a registered entity accountable for a vendor's adherence to (or lack of adherence to) a contract. Texas RE agrees as the SDT claims obtaining specific controls in the negotiated contract may not be feasible at all times but Texas RE believes this is *best practice*. In fact, in most cases contracts for these types of systems typically include security provisions and set similar expectations as described in the	

standard. The proposed standards would prohibit the compliance monitor from verifying the registered entity implemented part 1.6. Moreover, this verification is to ensure that the registered entities' plans are consistent with the contract's expectations and obligations of the parties. Admittedly, there will be circumstances in which a contracts may not be consistent or silent as it pertains to the responsible entity's security management plans (e.g. existing contacts or contracts in which the responsible entity was unable to negotiate the appropriate terms into the contract.) In those circumstances, other evidence should be provided demonstrating that the responsible entity has processes to ensure the vendor is expected/obligated to act consistent with the responsible entity's cyber security risk management plans as it relates to the vendor's products or services. Therefore, the contracts should remain in scope as to demonstrate the mapping of expectations from the plan to the contract as far as vendor interactions for those specific items included in the standard and to advance best practices leading to a more reliable BES. Texas RE also recommends the SDT remove or provide clarity on the verbiage that reads, "*and when the method to do so is available to the Responsible Entity from the software source*". A potential scenario exists now where vendors will attest that identity and integrity methods are not available therefore Part 1.6 is not applicable. Texas RE notes that the words "integrity" and "authenticity" are used in the Guidelines and Technical Basis however Part 1.6 uses the words "identity" and "integrity". Are these intended to be the same?

Likes 0	
Dislikes 0	

Response. Thank you for your comments.

Part 1.6 applies to baseline changes after the effective date of the standard, regardless of whether the responsible entity has a contract with a vendor. The SDT believes the measures describe the acceptable evidence that should be used to assess responsible entity adherence to the software verification requirements.

SDT believes the phrase 'when a method to do so is available' provides responsible entities with necessary flexibility to perform configuration management obligations. Responsible entities have varying baselines, software vintages, and vendor support. Flexibility

may be needed to prevent disruption of an entity's software update and patch management processes, including obligations under CIP-007. The SDT revised the guidelines section to remove terms that are not consistent with Part 1.6

4. The SDT removed low-impact BES Cyber Systems from the applicability in CIP-013-1 and is not proposing any new requirements for these cyber systems. The SDT believes that the proposed applicability to high and medium impact BES Cyber Systems appropriately focuses industry resources on supply chain cyber security risk management for industrial control system hardware, software, and computing and networking services associated with BES operations, as specified in Order No. 829. Do you agree with the SDT's removal of low impact BES Cyber Systems from CIP-013-1? If you do not agree, or if you agree but have comments or suggestions, please provide your recommendation and explanation.

Response. Thank you for your comments. The SDT believes prioritizing high and medium impact BES Cyber Systems in the supply chain cyber security risk management standards is an appropriate approach to meeting the directives in FERC Order No. 829 and focuses industry resources on protecting the most impactful BES Cyber Systems. The proposed standards address directives requiring plans, processes, and controls for supply chain cyber security risk management for “industrial control system hardware, software, and services associated with bulk electric system operations”(P. 43). High and medium impact BES Cyber Systems, as categorized in CIP-002-5, generally describe assets that are critical to interconnected operations including transmission operations, reliability coordination, and balancing functions. The proposed requirements prioritize these cyber systems by specifying mandatory requirements, while entities retain flexibility for determining appropriate steps for addressing supply chain cyber security risks for low impact BES Cyber Systems. The approach provides an opportunity for industry to take measured steps to addressing complex supply chain cyber security risks using an established prioritization mechanism. The reliability benefit of a measured and prioritized approach is that it is more manageable for responsible entities to focus the development of their plans, processes, and controls on the smaller subset of cyber assets that includes the most significant cyber assets. Additionally, the SDT anticipates that the proposed standards may provide some risk mitigation for low impact BES Cyber Systems even though the requirements do not specifically apply to low impact BES Cyber Systems. One way that	

reliability benefits may be extended to low-impact BES Cyber Systems through the approval of CIP-013-1 is by responsible entities that own all three classifications of cyber assets (high, medium, and low). These entities may use some or all of the processes in their cyber security risk management plans that meet the CIP-013-1 requirements to plan and procure cyber assets that are used in low impact BES Cyber Systems. Another potential way that the reliability benefits may be extended to low impact BES Cyber Systems is through vendor adoption of CIP-013-1 related security controls that the vendor voluntarily includes in low impact BES Cyber System contracts with responsible entities.

While the IRC members do not have Low Impact Bes Cyber Systems we have multiple interfaces with our Market Participants that do have Low Impact BES Cyber Systems. This, in turn represents, risk to our BES Cyber Systems. As such we recommend that CIP-013-1 apply to Low Impact BES Cyber Systems to reduce the supply chain risk not only to the Low Impact BES Cyber Systems but to the IRC member organization's BES Cyber Systems. Note: **PJM does not support this comment**.

IESO	
Answer	
Document Name	

Comment
As the IESO does not have any low impact BES Cyber Systems we abstain from answering Yes or No to this question. However, we suggest the rationale for not including Low Impact Bes Cyber Systems is not clear. We also suggest that small to medium sized Responsible Entities have the most to gain from CIP-013 as they have the fewest resources to mitigate risks from the supply chain. While the IIESO does not have Low Impact Bes Cyber Systems we have multiple interfaces with our Market Participants that do have Low Impact BES Cyber Systems. This, in turn represents, risk to our BES Cyber Systems. As such we recommend that CIP-013-1 apply to Low Impact BES Cyber Systems to reduce the supply chain risk not only to the Low Impact BES Cyber Systems but to the IRC member organization’s BES Cyber Systems.

Steven Rueckert - Western Electricity Coordinating Council - 10	
Answer	No
Document Name	
Comment	

While the initial direction of CIP-013-1 is good and provides protection for High BCS and Medium BCS, similar Cyber Assets associated with Low impact BES Cyber Systems may represent vectors for attack to High BCS or Medium BCS if left unprotected. WECC understands the reluctance of industry to incorporate Low impact BCS and their component BCA and other Cyber Assets under the CIP-013-1 purview and supports remanding SCRM issues associated with Low impact BCS to the CIP-003 Standard Drafting Team for integration into R1.2 and R2 of that Standard to ensure SCRM is integrated into those BCS at a level commensurate with the risk posed to the reliability of the BES.

Venona Greaff - Oxy - Occidental Chemical - 7, Group Name Oxy	
Answer	Yes
Document Name	
Comment	
Oxy agrees with the removal of low impact BCS from CIP-013-1 and agrees that the current standard as written appropriately addresses the Commission's concerns as specified in Order No. 829. Oxy believes that for entities that have a mixture of high, medium and low impact assets, the low impact assets would inherently benefit from the requirements applicable to high and medium impact assets as a matter of normal business practice, as the high water mark will be applied when purchasing equipment and services. This will account for a large portion of low impact BES Cyber Systems. Oxy believes it is appropriate to address the supply chain requirements using this risk-based approach. Low impact BES Cyber Systems are categorized as low impact because they inherently pose a low risk to negatively impact the Bulk Electric System. Resources should focus on those systems that have the potential for significant adverse impact on the BES. Additionally, vendors will not differentiate their product as low, medium or high impact, so as vendors address the requirements of high and medium impact entities, low impact entities will acquire the same products and services as medium and high impact entities. If low impact BES Cyber Systems were included in CIP-013-1, the costs associated with compliance would far outweigh the risk posed to the BES, in both manpower and additional equipment and services.

Answer	Yes
Document Name	
Comment	
Duke Energy agrees with the removal of low-impact BES Cyber Systems from the applicability of CIP-013-1. Low-impact BES Cyber Systems have been subject to a risk assessment and classified low-impact since they pose a minimal threat to the BES. Also, a Responsible Entity is not required to have an inventory list of its low-impact BES Cyber Systems. If this standard were to apply to low-impact BES Cyber Systems, this would likely create a situation wherein an inventory list is necessary. This would be a significant effort, which would not likely bolster the reliability of the grid, based on the limited impact lows present to the system.

Comment	
Luminant believes it is appropriate to address the supply chain requirements using a risk-based approach. Low impact Cyber Systems are categorized as low impact because they inherently have a low ability to negatively impact the Bulk Electric System. We should focus our resources on those systems that have the potential for significant adverse impact on the BES. In addition, there are many types of low impact Cyber Systems. If a decision was made to put them back into the standard, there would need to be extensive work on evaluating each of these types of systems in order to determine whether there is adequate benefit to reliability to offset the cost and burden of imposing supply chain requirements for these systems.

Texas RE's opinion is that low impact BES Cyber Systems should be included in CIP-013-1 because industrial control systems monitor and operate BES Cyber Assets located at transmission substations, wind farms, and generation facilities. Texas RE noticed that Question 4 uses the words "hardware, computing and networking services", which are not found in CIP-013-1. Should they be used in CIP-013-1 instead of "equipment, products, and services"?

Response. Thank you for your comments. The SDT believes prioritizing high and medium impact BES Cyber Systems in the supply chain cyber security risk management standards is an appropriate approach to meeting the directives in FERC Order No. 829 and focuses industry resources on protecting the most impactful BES Cyber Systems. The proposed standards address directives requiring plans, processes, and controls for supply chain cyber security risk management for "industrial control system hardware, software, and services associated with bulk electric system operations"(P. 43). High and medium impact BES Cyber Systems, as categorized in CIP-002-5, generally describe assets that are critical to interconnected operations including transmission operations, reliability coordination, and balancing functions. The proposed requirements prioritize these cyber systems by specifying mandatory requirements, while entities retain flexibility for determining appropriate steps for addressing supply chain cyber security risks for low impact BES Cyber Systems. The approach provides an opportunity for industry to take measured steps to addressing complex supply chain cyber security risks using an established prioritization mechanism. The reliability benefit of a measured and prioritized approach is that it is more manageable for responsible entities to focus the development of their plans, processes, and controls on the smaller subset of cyber assets that includes the most significant cyber assets. Additionally, the SDT anticipates that the proposed standards may provide some risk mitigation for low impact BES Cyber Systems even though the requirements do not specifically apply to low impact BES Cyber Systems. One way that reliability benefits may be extended to low-impact BES Cyber Systems through the approval of CIP-013-1 is by responsible entities that own all three classifications of cyber assets (high, medium, and low). These entities may use some or all of the processes in their cyber security risk management plans that meet the CIP-013-1 requirements to plan and procure cyber assets that are used in low impact BES Cyber Systems. Another potential way that the reliability benefits may be extended to low impact BES Cyber Systems is through vendor adoption of CIP-013-1 related security controls that the vendor voluntarily includes in low impact BES Cyber System contracts with responsible entities. The SDT used wording in CIP-013-1 that is consistent with other CIP standards. The SDT did not use the wording from Order No. 829 because it could be potentially unclear to responsible entities.

SMUD generally agrees with an 18-month implementation plan but, would prefer a 24-month implementation plan. SMUD feels that a 24-month timeframe is more appropriate and gives the entity additional time to align budgets and develop processes with vendors and suppliers. SMUD is indicating a "no" response as the implementation plan does not include a pilot. The implementation of TCA CIP 010 R4 was difficult as entities did not have a model implementation to learn practical applications of the standard in operations. Other standards that had a pilot allowed entities to learn practical implementation decisions that would save money and time. Please note, SMUD is willing to participate as a pilot participant.

Response. Thank you for your comments. The SDT believes the proposed requirements can be implemented within the 18-month implementation period, and that this period appropriately reflects the urgency needed to address the reliability risk. The purpose of the Implementation Plan is to propose the effective dates of the Reliability Standards. A pilot program could support entity implementation and would not impact the proposed effective dates. SDT has shared the recommendation for a pilot with NERC and ERO staff for consideration as plans are developed to support industry implementation.	
Wendy Center - U.S. Bureau of Reclamation - 5	
Answer	No
Document Name	
Comment	

It is uncertain when purchasing activities become subject to CIP-013-1. The proposed Implementation Plan states: "Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in the contract do not determine whether the contract is within scope of CIP-013-1."

Reclamation recommends that the "General Considerations" guidance contained in the Implementation Plan pertaining to purchasing activities be included in the proposed standard.

If the "General Considerations" guidance on purchasing activities becomes part of the proposed standard, Reclamation further recommends:

- A contract becomes within scope when the entity commences its formal contract process such as when a request for proposal or solicitation is issued.
- Any direct purchase and/or any repurposed equipment is within scope prior to connecting to the Bulk Electric System as a cyber asset.

Response. Thank you for your comments. The SDT has revised the Implementation Plan to clarify when an entity's procurement actions become subject to CIP-013-1. The general consideration section now reads:

In implementing CIP-013-1, responsible entities are expected to use their Supply Chain Cyber Security Risk Management Plans in procurement processes (e.g., Request for Proposal, requests to entities negotiating on behalf of the responsible entity in the case of cooperative purchase agreements, master agreements that the responsible entity negotiates after the effective date, or direct procurements covered under the responsible entity's plan) that begin on or after the effective date of CIP-013-1.

Nicholas Lauriat - Network and Security Technologies - 1

Answer	No
Document Name	

Comment	
CIP-013 R2 and/or the Implementation Plan should contain “trigger” language for R2 that clarifies an entity must implement its R1 risk management plan(s) for new procurement contracts signed on or after the Effective Date of CIP-013. Entities with no new procurement contracts or no new in-progress procurements on the Effective Date should not be expected to be able to demonstrate compliance with R2 at that time.	
Likes 0

Response. Thank you for your comment. SDT has revised the Implementation Plan to clarify when an entity must implement its plans. The general consideration section now reads:

> *In implementing CIP-013-1, responsible entities are expected to use their Supply Chain Cyber Security Risk Management Plans in procurement processes (e.g., Request for Proposal, requests to entities negotiating on behalf of the responsible entity in the case of cooperative purchase agreements, master agreements that the responsible entity negotiates after the effective date, or direct procurements covered under the responsible entity’s plan) that begin on or after the effective date of CIP-013-1.*

The SDT agrees that entities should not be expected to demonstrate compliance with Requirement R2 if the entity has not initiated procurement processes when the requirement is effective.

GRE and the NRECA supports the new implementation plan timeframe. However, this implementation plan unintentionally removes the provisions for additional time to implement unplanned changes in CIP-005 and CIP-010 that was provided in the V5 and V6 implementation plans. NRECA strongly requests that the language from the "Planned or Unplanned Changes Resulting in a Higher Categorization" section of the CIP V5 standards implementation plan be re-inserted into the supply chain implementation plan. Additionally, the absence of the "Applicable Facilities" section or other language that clearly indicates these standards/requirements do not apply to "low" entities is missing in the Implementation Plan. NRECA urges the SDT to add this section the Implementation Plan.

Brandon Cain - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company	
Answer	Yes
Document Name	
Comment	

Southern recommends that the SDT consider addressing previous issues with the Implementation Plan versions between CIP V5, V6, V7, etc., where Implementation Plans were “chained” together and there was not an Implementation Plan that contained all the necessary requirements in a single source. Southern strongly recommends producing a consolidated Implementation Plan.

Southern recommends that NERC and the SDT(s) consider addressing issues with the Implementation Plan versions between CIP V5, V6, V7, and Supply Chain, as Implementation Plans are “chained” together and there is no one Implementation Plan that contains all the necessary requirements in a single source. Implementation Plans for the CIP standards cover several important areas:

Implementation schedules of new or modified CIP standard requirements.

Implementation schedules for newly identified cyber assets brought into scope with current requirements based on planned or unplanned changes in the BES assets, or those from newly registered NERC entities. (previously known as IPFNICANRE – Implementation Plan for Newly Identified Cyber Assets or Newly Registered Entities)

Implementation schedules for BES Cyber Systems already in scope that change impact levels due to planned or unplanned changes in the BES.

As an example, the last page of the Implementation Plan for CIP-003-7 states that CIP-003-6 is retired upon approval of CIP-003-7, yet it chains to the CIP-003-6 Implementation Plan to tell entities how to handle cyber systems that change impact categorization. The CIP-003-6 implementation plan simply says it replaces *parts* of the V5 implementation plan for the modified standards in that revision. Only the V5 plan addresses the 2nd bullet point above. Responsible Entities are left to unravel three different plans with supply chain adding yet another to get one picture of what is due when and knowing how to handle BES changes that affect cyber system identification and impact categorization.

As we go forward, we need a better solution. Parts of an implementation plan, such as bullets 2 and 3 above, need to live on indefinitely. Other parts, such as the schedule of new or modified requirements, need to live until those dates have passed. Chaining all

of this together through numerous documents as the CIP standards continue to evolve and grow to cover new areas is not a sustainable solution that promotes clarity in knowing the compliance obligation in a changing environment.	
Likes 0	
Dislikes 0	
Response. Thank you for your comment. The SDT agrees that Implementation Plans should avoid or, at a minimum provide clear details of, any overlap with pending effective dates of pending Reliability Standards requirements so that entities have clarity on the impact of implementation on their compliance obligations. The proposed Project 2016-03 Implementation Plan is not tied to requirements that have future effective dates, thereby avoiding some of the expressed concerns. Furthermore, the Implementation Plan has been revised to include provisions for unplanned changes so that it is not reliant on these provisions from Implementation Plans associated with other standards.

Comment	
AE generally agrees with an 18-month implementation plan but, would prefer 24-months. AE feels a 24-month timeframe is more appropriate and gives entities additional time to align budgets and develop processes with vendors and suppliers. As a municipal utility, AE's procurement process is quite long.

Response. Thank you for your comment. The SDT believes the proposed requirements can be implemented within the 18-month implementation period, and that this period appropriately reflects the urgency needed to address the reliability risk. The SDT also believes the flexibility provided in the requirements supports the various procurement processes that may be used by responsible entities.

The SDT revised the General Consideration section to incorporate the suggested wording, and included provisions for unplanned changes consistent with other CIP standards.

The SDT has revised the General Considerations section in the Implementation Plan as follows:

> *In implementing CIP-013-1, responsible entities are expected to use their Supply Chain Cyber Security Risk Management Plans in procurement processes (e.g., Request for Proposal, requests to entities negotiating on behalf of the responsible entity in the case of cooperative purchase agreements, master agreements that the responsible entity negotiates after the effective date, or direct procurements covered under the responsible entity's plan) that begin on or after the effective date of CIP-013-1.*

Normande Bouffard - Hydro-Quebec Production - 5	
Answer	Yes

Comment	

Recommend changing this General Consideration from

Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in the contract do not determine whether the contract is within scope of CIP-013-1.

To

Supply Chain Risk Management plan must be used by the procurement processes that begin on or after the implementation date of the CIP-013-1. Make corresponding change to the CIP-013 R2 note.

And

CIP-005-6 and CIP-010-3 must be implemented 18 months after the implementation date of the CIP-013-1

Implementation Plan does not handle unplanned changes such as IROLs or registration, etc.

Request a 24 month implementation of CIP-013-1 due to budget cycles and technical controls for other CIP Standards

Likes 0

Response. Thank you for your comment. The SDT revised the General Consideration section to incorporate the suggested wording, and included provisions in the Implementation Plan for unplanned changes consistent with other CIP standards.

The SDT does not believe it is necessary to delay implementing CIP-005-6 and CIP-010-3 until after CIP-013-1. Procurement actions taken according to the entity's Supply Chain Cyber Security Risk Management Plan can support the new requirements in CIP-005-6 and CIP-010-3, however the new CIP-005-6 and CIP-010-3 requirements are written so that they are not dependent on these procurement actions.

While in overall agreement with the updated Implementation Plan, ACEC does have the following concern:	

The second paragraph in the section "General Considerations" states "Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in the contract do not determine whether the contract is within scope of CIP-013-1." Based upon the above wording it could be understood that Master Supply Agreements (MSAs) would need to be changed in the first RFP after implementation of the new standard. The paragraph should state specifically that this is not required, and that the plan can allow MSAs to exist as is until it is time to review in the normal procurement process.

NRECA supports the new implementation plan timeframe. However, this implementation plan unintentionally removes the provisions for additional time to implement unplanned changes in CIP-005 and CIP-010 that was provided in the V5 and V6 implementation plans. NRECA strongly requests that the language from the "Planned or Unplanned Changes Resulting in a Higher Categorization" section of the CIP V5 standards implementation plan be re-inserted into the supply chain implementation plan. Additionally, the absence of the "Applicable Facilities" section or other language that clearly indicates these standards/requirements do not apply to "low" entities is missing in the Implementation Plan. NRECA urges the SDT to add this section the Implementation Plan.

Texas RE requests that the SDT provide its rationale for extending the effective date from 12 to 18 months. For example, it is unclear whether the SDT believes more certainty is required regarding the necessary technical deployments for compliance with the Standard as some commenters suggested to justify the extended implementation period.	
Likes 0	
Dislikes 0	
Response. Thank you for your comment. The SDT agrees with commenters that the proposed requirements can be impacted by budget cycles, which can extend beyond 12-months. The SDT believes the proposed requirements can be implemented within the 18-month implementation period, and that this period appropriately reflects the urgency needed to address the reliability risk.

Duke Energy suggests the drafting team consider implementing a staggered approach to the VSL(s) specifically to CIP-013-1 R2. As written, an entity could implement all aspects but one sub-part of the risk management plan, and the violation would have a VSL of Severe. We recommend the drafting team consider a more equitable approach and stagger the VSL(s) similar to the approach used in R1 of CIP-003-6.

We do not agree with the VRF Justification for CIP-013-1 R1, FERC VRF G5 with the new redline. Agree with the words that were redline out.	

CIP-010 – VSL does not cover the failure to implement the process and therefore does not include all of the combinations. Consequently, we request that there be lower severity levels when a single aspect of the requirements is missing. Request that that the term “elements” be included in CIP-013 R1.2 (as shown in comments for question 1) to clearly align with the VSLs for this requirement.

Response. Thank you for your comment. The SDT agrees with the suggested change to the VRF justification for CIP-013-1 Requirement R1. For all CIP-010 Requirement R1 parts, implementation of the specified processes is covered under existing Lower, Moderate, High, and Severe VSLs as a collective configuration change management process. The SDT believes it has integrated new Part 1.6 in a manner that is consistent with the other parts in approved CIP-010-2 Requirement R1. The SDT has removed the term ‘elements’ from the VSL for CIP-013-1 Requirement R1 Part 1.2.

The VSL for R2 only provides for a Severe VLS. It is unclear what is meant by "did not implement". If your plan has 5 areas within it and 4 of the 5 were fully implemented, has the plan been implemented? I contend yes however not fully implemented. The VSL were created to identify how far of the complaince mark an entitiy fell. This VLS completly fails to perform this action. While at the same time the VSL for R3 utilizes arbitrary calendar months for clear VLS seperation between lower and severe. Both of these VLS provide little benefit to industry in assessing the real impact to the BES based on an entity missing the complaince mark.

The IRC suggests the drafting team add more thresholds to the VSLs for R2 of CIP-013-1 and that it be aligned more closely with that of R1, rather than making it binary. The cyber security risk management plan will be fairly large and missing small portions of the plan should not immediately result in a Severe VSL.

SRP agrees with the VRFs and VSLs for CIP-010 and CIP-013. SRP believes that the VRFs and VSLs for CIP-005 should be updated to reflect the same approach that was taken in CIP-010. The VSL for CIP-005 results in a severe penalty if the entity did not have a method to	

determine and did not have a method to disable. SRP would prefer a High VSL penalty if the entity has a process to determine but does not have a process to disable and vice-versa if the entity did not have a process to determine but does have a process to disable. SRP requests that the term “elements” be included in CIP-013 R1.2 (as shown above) to clearly align with the VSLs for this requirement.

7. The SDT developed draft Implementation Guidance for CIP-013 to provide examples of how a Responsible Entity could comply with the requirements. The draft Implementation Guidance does not prescribe the only approach to compliance. Rather, it describes some approaches the SDT believes would be effective ways to comply with the standard. See NERC's Compliance Guidance policy for information on Implementation Guidance. Do you agree with the example approaches in the draft Implementation Guidance? If you do not agree, or if you agree but have comments or suggestions for the draft Implementation Guidance, please provide your recommendation and explanation.

Implementation Guidance for R3	

Neither main bullet meets compliance because both only deal with the review and not the approval. Recommend changing “Below are some examples of approaches to comply with this requirement:” to “Below is an example of an approach to comply with the review requirement required by:” Implementation Guidance for R3 – Recommend removing this language from the second main bullet, since it is beyond the Requirement “Upon approval of changes to the supply chain cyber security risk management plan(s), the CIP Senior Manager or approved delegate should provide appropriate communications to the affected organizations or individuals. Additionally, communications or training material may be developed to ensure any organizational areas affected by revisions are informed.”

Response. Thank you for your comment. The SDT is not developing revisions the ERO Enterprise-endorsed Implementation Guidance at this time. The SDT agrees that revisions to the Implementation Guidance for Requirement R3 could be developed to address these concerns. NERC Compliance Guidance Policy provides a means for any NERC registered entity to document examples of approaches and vet them through an approved organization for endorsement consideration by the ERO Enterprise.

CHPD is uncertain if this new approach best provides assurance and guidance about these new Standards in the absence of the "Guidance and Technical Basis" sections in each Standard and the intentional flexibility of CIP-013 in particular. CHPD is concerned about the possibilities that NERC and the Regions (1) may not endorse the separate implementation guidance at all, (2) may not endorse the guidance in a timely manner with regard to balloting, and (3) may withdraw previously-granted endorsement should FERC request revisions to the Standard. As such, CHPD would prefer to see the new "Implementation Guidance Document" supplemented with "Guidance and Technical Basis" sections in each Standard.	
Likes 0	
Dislikes 0	
Response. Thank you for your comment. The CIP-013-1 Implementation Guidance has been endorsed by the ERO Enterprise. In developing the document, the SDT is being consistent with the board approved Compliance Guidance Policy which states that Implementation Guidance is the appropriate place to describe examples of approaches for complying with the standard. The SDT is not duplicating the material in the Guidelines and Technical Basis section because the examples pertain to compliance approaches. In the event that FERC requests revisions to CIP-013-1, the SDT agrees that the endorsed Implementation Guidance would not be effective since it applies to CIP-013-1. However, any revisions to CIP-013 required to respond to FERC directives must go through the standards development process, including stakeholder commenting and balloting. Industry could again develop revised guidance during the standards development process and submit it to the ERO Enterprise for endorsement.

The existing guidance still provides no scope of cyber security risks that should be considered, and without context, many of the proposed actions have no guidelines or measurements for "success" or "failure" or acceptability; nor are there suggested acceptable mitigations if a criterion is not completely met, since there is no clear objective. Furthermore, there is no allowance made for a continuous process, where, as a result of products already being used in BES Cyber Systems and subjected to the existing CIP standards, cyber security risks	

associated with networks, products and vendors are evaluated on an on-going basis. Detailed changes and additions are outlined in a separate redline Draft Implementation Guidance document that has been forwarded to NERC and the SDT. A summary of the proposals is as follows:

1. Throughout the document, the term 'controls' should be changed to a term that more closely reflects the language in the proposed standard. Dominion recommends using 'terms and conditions'.
2. On page 2, dominion recommends clarifying that cyber security risks are limited to supply chain with the addition of 'supply chain' prior to each use of the term cyber security risks.
3. In addition to the clarifying language in item #2 above, Dominion recommends adding the following to more clearly define the term 'supply chain cyber security risk:

(1) procuring and installing un-secure equipment or (2) procuring and installing un-secure software, including purchasing counterfeit software, or software that has been modified by an un-authorized party, (3) unintentionally failing to anticipate security issues that may arise due to network architecture, (4) unintentionally failing to anticipate security issues that may arise during technology and vendor transitions for BES Cyber Systems). The additional bullets could be sub-bullets under the appropriate of these four broad areas as examples rather than individual, isolated items.

4. Dominion recommends deleting the third paragraph on page 2. This paragraph appears to be creating new/different obligations. The language appears to create confusion and calls out Section 1.2.5 specifically for no apparent reason.

5. The language in blue boxes throughout the document should be retained and included in the text of the document.

6. It is unclear what the purpose of including certain language in a blue box is.

7. Section headings should be included with each of the examples. Also, the bulleted format makes it unclear if one, all, or a certain number of bulleted items need to be performed to achieve compliance.

8. Add the following example under R1.1:

Develop an approved vendor/products list. When planning a BCS, the RE should evaluate the following items:

-
  - Vendors
  - Products
  - Network Architecture
  - Network Components.

The RE should document (which may be limited to the baseline and cyber vulnerability assessment (CVA) required for a new product) any risks (i.e. 1) procuring and installing un-secure equipment or (2) procuring and installing un-secure software, including purchasing counterfeit software, or software that has been modified by an un-authorized party, (3) unintentionally failing to anticipate security issues that may arise due to network architecture, (4) unintentionally failing to anticipate security issues that may arise during technology and vendor transitions for BES Cyber Systems) identified and how the risks are mitigated for any "item" that deviates from those vendors, products, network architecture, and network components already being used within the RE's BCS infrastructures, which are required to comply with existing CIP standards.

9. The second bullet in Section 1.2.2 should be removed. It is already addressed under Section 1.2.1.

10. In Section 1.2.3, the end of the first bullet could state be clarified as follows:

Delete 'within a negotiated period of time of such determination' and replace with "to allow the RE to remove access within 24 hours of the determination, consistent with existing CIP standards"

Replace 'breaches' with 'vulnerabilities' for clarity and consistency'.

Response. Thank you for your comment. The CIP-013-1 Implementation Guidance has been endorsed by the ERO Enterprise. In developing the document, the SDT is being consistent with the board approved Compliance Guidance Policy which states that Implementation Guidance is the appropriate place to describe examples of approaches for complying with the standard. The SDT is not duplicating the material in the Guidelines and Technical Basis section because the examples pertain to compliance approaches. In the event that FERC requests revisions to CIP-013-1, the SDT agrees that the endorsed Implementation Guidance would not be effective since it applies to CIP-013-1. However, any revisions to CIP-013 required to respond to FERC directives must go through the standards development process, including stakeholder commenting and balloting. Industry could again develop revised guidance during the standards development process and submit it to the ERO Enterprise for endorsement.

The Implementation Guidance only identifies items that could be evaluated in developintg a Supply Chain Cyber Security program, but does not provide an example or guidance on how to implement the program. Without this guidance, it is impossible to understand how to comply with CIP-013-1 in a cost-effective and compliant manner.

Comment	
BC Hydro does not agree with the examples as compliance will be challenging. It would require us to have sufficient authority over the vendor (which will not be the case in most situations). There is also no way to ensure that a vendor is being completely transparent regarding cyber vulnerabilities in their product. Such disclosure could have other impacts on their business with other clients. This would be a dis-incentive for disclosure. BC Hydro does not believes CIP-013 is necessary and cyber control is already achieved with the rest of the CIP v5 standard requirements around change control, testing and ongoing systems monitoring.

It is uncertain when purchasing activities become subject to CIP-013-1. The proposed Implementation Plan states: “Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in the contract do not determine whether the contract is within scope of CIP-013-1.”

Reclamation recommends that the “General Considerations” guidance contained in the Implementation Plan pertaining to purchasing activities be included in the proposed standard.

If the "General Considerations" guidance on purchasing activities becomes part of the proposed standard, Reclamation further recommends: • A contract becomes within scope when the entity commences its formal contract process such as when a request for proposal or solicitation is issued. • Any direct purchase and/or any repurposed equipment is within scope prior to connecting to the Bulk Electric System as a cyber asset.

There is inconsistency between the Implementation Guidance and CIP-010, R1. The requirement states "For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5". The Guidelines and Technical Basis section heading Software and Authenticity, paragraph three on page 39, states: "It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches." The requirement wording suggests it applies for any change but the Guidance suggests that for some changes, such as patches, it would not apply. Oncor believes that automated patch deployment solutions should be able to verify the identity and integrity of the patch. Therefore, it is believed that the best solution is to modify the Guidance.

Definition of vendor is not a NERC defined term. The term “vendor” is also used in the proposed CIP-005. USI believes the SDT should provide guidance regarding the use of the term “vendor.” If “Vendor” is not defined by NERC, the Guidance should recommend that Entities include their definition of “vendor” in their plan(s). **Implementation Guidance for R3** Neither main bullet meets compliance because both only deal with the review and not the approval. Therefore, USI recommends changing: ”Below are some examples of approaches to comply with this requirement: “ to “Below is an example of an approach to comply with the review requirement required by: “ In addition, we recommend removing this language from the second main bullet, since it is beyond the Requirement: “Upon approval of changes to the supply chain cyber security risk management plan(s), the CIP Senior Manager or approved delegate should provide appropriate communications to the affected organizations or individuals. Additionally, communications or training material may be developed to ensure any organizational areas affected by revisions are informed.” Also, there should be corresponding “Guidelines and Technical Basis” or “Rationale” for CIP-005-6 Requirement R2 Parts 2.4 and 2.5.

Response. Thank you for your comment.

The SDT believes the description of *vendor* in the Rationale section gives clarity to the CIP-013 requirements without limiting flexibility needed by responsible entities for developing and implementing cyber security risk management plans that meet the entity's procurement and cyber security needs. This description and all information in the rationale sections remain with the standards in the supplemental material section to inform Responsible Entities, compliance, and enforcement staffs.

The SDT is not developing revisions the ERO Enterprise-endorsed Implementation Guidance at this time. The SDT agrees that revisions to the Implementation Guidance for Requirement R3 could be developed to address the concerns. NERC Compliance Guidance Policy provides a means for any NERC registered entity to document examples of approaches and vet them through an approved organization for endorsement consideration by the ERO Enterprise.

CIP-005-6 includes Rationale. The Rationale section will be moved to the Supplemental Material section of the standard following NERC Board adoption.

- The language within the Implementation Guidance contradicts the language within CIP-013. (i.e. System-based approach). The Implementation Guidance is not auditable, however, the Standard and Requirements are. EDPR NA suggests that the Implementation Guidance is eliminated and further support are provided within the Measures for a Registered Entity and auditor's reference.
- There are numerous items in which vendors will not provide information on unless an entity is willing pay significant increases (risks, training, methodologies, threats, etc.)

• EDPR NA also suggests that NERC utilize a pilot program to test these requirements prior to enforcing the implementation of CIP-013 to all Registered Entities. • Please provide more support with respect to the expectations and possible evidence for Requirement 2.

Response. Thank you for your comment. The CIP-013-1 Implementation Guidance has been endorsed by the ERO Enterprise. In developing the document, the SDT is being consistent with the board approved Compliance Guidance Policy which states that Implementation Guidance is the appropriate place to describe examples of approaches for complying with the standard. Furthermore, ERO Enterprise Compliance Monitoring and Enforcement Program (CMEP) staffs give deference to the examples in endorsed guidance when conducting compliance monitoring activities. The SDT believes an entity can use a system-based approach in its Supply Chain Cyber Security Risk Management plan(s) as described in the Implementation Guidance to comply with Requirement R1. The examples provided in the ERO-Enterprise endorsed Compliance Guidance can be implemented by responsible entities using their procurement processes. The requirements in CIP-013-1 do not require responsible entities to impose obligations on vendors. CIP-013-1 does not obligate entities to obtain specific contract provisions, preserving entity flexibility to make cost decisions. The SDT agrees that a pilot program could support entity implementation and would not impact the proposed effective dates. SDT has shared the recommendation for a pilot with NERC and ERO staff for consideration as plans are developed to support industry implementation. The examples of approaches described in the section titled 'Implementation Guidance For Requirement R1', when used in planning and procurement as specified in the entity's plan, provide an example of a compliance approach to meeting Requirement R2.

There appears to be inconsistency between the requirement and the Guidelines in CIP-010 R1.

The requirement states, in relevant part, “For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5.”

The Guidelines and Technical Basis section heading “Software and Authenticity,” paragraph three on page 39, states: “It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches.” The wording of the CIP-10-3 R1.6 Guidelines and Technical Basis section seems to imply that every time a patch/software is downloaded it does not have to be checked. Based on how the standard is written, the software source and the software must be verified each time something is downloaded. Even if that software was previously downloaded, the source must be validated and so must the software before application.

Furthermore, the requirement wording suggests it applies for any change but the Guidelines suggests that for some changes, such as patches, it would not apply. As the requirement is auditable and the Guidelines are not, the Guidelines become superfluous. The Guideline also introduces significant ambiguity that is impossible to audit. SPP recommends that the SDT review the Guidelines and the draft standard for consistency and resolution. In addition, SPP recommends that because automated patch deployment solutions should be able to verify the identity and integrity of the patch, the SDT consider allowing for this method of verification in the Measures or Guidelines. SPP notes that there is no corresponding "Guidelines and Technical Basis" or "Rationale" for CIP-005-6 Requirement R2 Parts 2.4 and 2.5.

NRG has concerns that the Implementation Guidance for R3 (main bullet) may not meet compliance because both only deal with the review and not the approval. NRG recommends that the NERC SDT consider changing "Below are some examples of approaches to comply with this requirement:" to "Below is an example of an approach to comply with the review requirement required by:"	

NRG has concerns that the Implementation Guidance for R3 – (specifically): "Upon approval of changes to the supply chain cyber security risk management plan(s), the CIP Senior Manager or approved delegate should provide appropriate communications to the affected organizations or individuals. Additionally, communications or training material may be developed to ensure any organizational areas affected by revisions are informed." Therefore, NRG recommends that the NERC SDT consider removing this language from the second main bullet, since it is beyond the Requirement. There appears to be inconsistency between the requirement and the Guidelines in CIP-010 R1. The requirement states, in relevant part, "For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5." The Guidelines and Technical Basis section heading "Software and Authenticity," paragraph three on page 39, states: "It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches." The wording of the CIP-10-3 R1.6 Guidelines and Technical Basis section seems to imply that every time a patch/software is downloaded it does not have to be checked. Based on how the standard is written, the software source and the software must be verified each time something is downloaded. Even if that software was previously downloaded, the source must be validated and so must the software before application. Furthermore, the requirement wording suggests it applies for any change but the Guidelines suggests that for some changes, such as patches, it would not apply. As the requirement is auditable and the Guidelines are not, the Guidelines become superfluous. The Guideline also introduces significant ambiguity that is impossible to audit. NRG recommends that the SDT review the Guidelines and the draft standard for consistency and resolution. In addition, NRG recommends that because automated patch deployment solutions should be able to verify the identity and integrity of the patch, the SDT consider allowing for this method of verification in the Measures or Guidelines. Yes, and BPA disagrees with the language in Requirement R3 requiring the CIP Senior Manager or delegate approve the supply chain cyber security risk management plans. Other CIP standards, such as CIP-003-6, Requirement R1, require CIP Senior Manager approval of "policies," not "plans." In Order No. 829, the Federal Energy Regulatory Commission stated, "*Consistent with or similar to the requirement in Reliability Standard CIP-003-6, Requirement R1*, the Reliability Standard should require the responsible entity's CIP Senior Manager to review and approve the controls adopted to meet the specific security objectives identified in the Reliability Standard at least every 15 months." Order No. 829 at P46 (emphasis added). Requiring CIP Senior Manager approval of plans is not consistent or similar to requiring approval of policies because plans are more tactical and numerous than policies. CIP Senior Manager approval should apply	

only to overarching strategic documents, and not to approval of highly detailed plans for implementation of processes. Instead, CIP-013 should be added to the list of policies requiring CIP Senior Manager approval in CIP-003-6, Requirement R1.

The understanding of the intent and purpose of CIP-013 is very dependent on the Implementation Guidance document. We are concerned about the possibilities that NERC and the Regions (1) may not endorse the separate implementation guidance at all, (2) may not endorse the guidance in a timely manner as regards balloting, and (3) may withdraw previously-granted endorsement should FERC request revisions to the Standard. As such we would prefer to see the new "Implementation Guidance Document" supplemented with "Guidance and Technical Basis" sections in each Standard.

Yes, the Compliance Guidance policy does provide industry with direction for implementation. However, those guidance details are not written in the requirements, measures or Reliability Standard Audit Worksheet (RSAW) and cannot be relied upon in preparation of an audit. ACES would suggest, at a minimum, that these guidelines be written in the Supply Chain Management RSAWs in the section 'Notes for an Auditor'. By placing this information in the RSAW, it gives industry additional reassurance that each region will audit Supply Chain Management consistently.

PRPA generally agrees with the Implementation Guidance for CIP-013 and feels that this is a promising new approach but is uncertain if the approach best provides assurance and guidance about these new Standards in the absence of the "Guidance and Technical Basis" sections in each Standard and the intentional flexibility of CIP-013 in particular. PRPA is concerned about the possibilities that NERC and the Regions (1) may not endorse the separate implementation guidance at all, (2) may not endorse the guidance in a timely manner as regards balloting, and (3) may withdraw previously-granted endorsement should FERC request revisions to the Standard. As such, PRPA would prefer to see the new "Implementation Guidance Document" supplemented with "Guidance and Technical Basis" sections in each Standard.

R3: PRPA requests that the following language be removed from the second main bullet, since it is out of scope for this Requirement. "Upon approval of changes to the supply chain cyber security risk management plan(s), the CIP Senior Manager or approved delegate should provide appropriate communications to the affected organizations or individuals. Additionally, communications or training material may be developed to ensure any organizational areas affected by revisions are informed."

Request that there be corresponding "Guidelines and Technical Basis" or "Rationale" for CIP-005-6 Requirement R2 Parts 2.4 and 2.5 and CIP-010-3 R1.6.

Response. Thank you for your comment. The CIP-013-1 Implementation Guidance has been endorsed by the ERO Enterprise. In developing the document, the SDT is being consistent with the board approved Compliance Guidance Policy which states that Implementation Guidance is the appropriate place to describe examples of approaches for complying with the standard. The SDT is not

duplicating the material in the Guidelines and Technical Basis section because the examples pertain to compliance approaches. In the event that FERC requests revisions to CIP-013-1, the SDT agrees that the endorsed Implementation Guidance would not be effective since it applies to CIP-013-1. However, any revisions to CIP-013 required to respond to FERC directives must go through the standards development process, including stakeholder commenting and balloting. Industry could again develop revised guidance during the standards development process and submit it to the ERO Enterprise for endorsement. The SDT is not developing revisions the ERO Enterprise-endorsed Implementation Guidance at this time. The SDT agrees that revisions to the Implementation Guidance for Requirement R3 could be developed to address these concerns. The SDT has included Rationale for CIP-005-6 Requirement R2 Parts 2.4 and 2.5, and both Rationale and Guidelines and Technical Basis for CIP-010-3 R1.6. The Rationale section will be moved to the Supplemental Material section of the standard following NERC Board adoption.

Amelia Sawyer - CenterPoint Energy Houston Electric, LLC - 1 - Texas RE	
Answer	Yes
Document Name	
Comment	
In the guidance for Requirement R1, Part 1.2.5, CenterPoint Energy believes including all third-party hardware, software, firmware, and services goes beyond the scope of the requirement. Most systems consist of components or services from numerous third-party companies. The vendor of such systems may not have direct contact with third-party companies. The level of third-party components or services that could be expected to be included may be quite extensive and therefore make it impractical for the vendor to commit to such issues in contract provisions.	
Likes 0	
Dislikes 0	

Response. Thank you for your comment. The SDT believes the examples in the Implementation Guidance for Part 1.2.5 show a way for a responsible entity to seek information through its procurement processes that may be helpful in addressing a valid security concern associated with vendor software. Responsible entities may use other approaches to meeting the obligation of Part 1.2.5.

SMUD generally agrees with the Implementation Guidance for CIP-013 and feels that this is a promising new approach but is uncertain if the approach best provides assurance and guidance about these new Standards in the absence of the “Guidance and Technical Basis” sections in each Standard and the intentional flexibility of CIP-013 in particular. SMUD is concerned about the possibilities that NERC and the Regions (1) may not endorse the separate implementation guidance at all, (2) may not endorse the guidance in a timely manner as regards balloting, and (3) may withdraw previously-granted endorsement should FERC request revisions to the Standard. As such, SMUD would prefer to see the new “Implementation Guidance Document” supplemented with “Guidance and Technical Basis” sections in each Standard. R3: SMUD requests that the following language be removed from the second main bullet, since it is out of scope for this Requirement. “Upon approval of changes to the supply chain cyber security risk management plan(s), the CIP Senior Manager or approved delegate should provide appropriate communications to the affected organizations or individuals. Additionally, communications or training material may be developed to ensure any organizational areas affected by revisions are informed.” SMUD also requests that there be corresponding “Guidelines and Technical Basis” or “Rationale” for CIP-005-6 Requirement R2 Parts 2.4 and 2.5 and CIP-010-3 R1.6.

Response. Thank you for your comment. The CIP-013-1 Implementation Guidance has been endorsed by the ERO Enterprise. In developing the document, the SDT is being consistent with the board approved Compliance Guidance Policy which states that Implementation Guidance is the appropriate place to describe examples of approaches for complying with the standard. The SDT is not duplicating the material in the Guidelines and Technical Basis section because the examples pertain to compliance approaches. In the event that FERC requests revisions to CIP-013-1, the SDT agrees that the endorsed Implementation Guidance would not be effective since it applies to CIP-013-1. However, any revisions to CIP-013 required to respond to FERC directives must go through the standards development process, including stakeholder commenting and balloting. Industry could again develop revised guidance during the standards development process and submit it to the ERO Enterprise for endorsement. The SDT is not developing revisions the ERO Enterprise-endorsed Implementation Guidance at this time. The SDT agrees that revisions to the Implementation Guidance for Requirement R3 could be developed to address these concerns. The SDT has included Rationale for CIP-005-6 Requirement R2 Parts 2.4 and 2.5, and both Rationale and Guidelines and Technical Basis for CIP-010-3 R1.6. The Rationale section will be moved to the Supplemental Material section of the standard following NERC Board adoption.

Yes, and BPA disagrees with the language in Requirement R3 requiring the CIP Senior Manager or delegate approve the supply chain cyber security risk management plans. Other CIP standards, such as CIP-003-6, Requirement R1, require CIP Senior Manager approval of "policies," not "plans." In Order No. 829, the Federal Energy Regulatory Commission stated, "*Consistent with or similar to the requirement in Reliability Standard CIP-003-6, Requirement R1*, the Reliability Standard should require the responsible entity's CIP Senior Manager to review and approve the controls adopted to meet the specific security objectives identified in the Reliability Standard at least every 15 months." Order No. 829 at P46 (emphasis added). Requiring CIP Senior Manager approval of plans is not consistent or similar to requiring approval of policies because plans are more tactical and numerous than policies. CIP Senior Manager approval should apply only to overarching strategic documents, and not to approval of highly detailed plans for implementation of processes. Instead, CIP-013 should be added to the list of policies requiring CIP Senior Manager approval in CIP-003-6, Requirement R1.

Dislikes 0	

Response. Thank you for your comment. Requirement R3 addresses the Order No. 829 directive for requiring CIP Senior Manager review and approval of the plan. (P. 46). The SDT believes it is appropriate to allow entities to have flexibility in determining whether the CIP Senior Manager or delegate should review and approve the plan. CIP-003-6 provides for policy review by CIP Senior Manager only	
Alan Farmer - ACEC - NA - Not Applicable - FRCC,MRO,WECC,Texas RE,NPCC,SERC,SPP RE,RF	
Answer	Yes
Document Name	
Comment	
While in overall agreement with the Implementation Guidance for CIP-013, ACEC does have the following concern: In the Implementation Guidance for R1 Section of the document, the subsections for implementation of Requirement R1 Parts 1.2.1, 1.2.2, 1.2.4 and 1.2.5 use the generic term “vendor(s)” in discussing these Software Authenticity and Integrity issues. To help in ensuring that these requirements are implemented in an effective manner, it is recommended that the SDT add a clarification item, noting that these requirements be addressed by the OEM providing the hardware and/or software, not a third-party such as an integrator.	
Likes 0	
Dislikes 0	
Response. Thank you for your comment. The SDT believes the ERO-Enterprise endorsed Implementation Guidance provides appropriate guidance as written and does not limit the responsible entity’s flexibility to address relevant security topics with the OEM. However the SDT believes it may not be practical for responsible entities to address the security topics with the OEM because the responsible entity may not have a relationship with the OEM that will allow the responsible entity to address the topics through its procurement processes.

N&ST has no disagreement with the example approaches contained in the Guidance but believes that while they may represent reasonable courses of action for large entities, they are likely to be far beyond the capabilities of small ones. N&ST believes an entity whose combined BES operations, OT support, and CIP compliance teams comprise fewer than 10 individuals would be hard-pressed to "form a team of subject matter experts from across the organization to participate in the BES Cyber System planning and acquisition process(es)." N&ST also believes, based on experience with CIP V1 – V5 cyber security training requirements, that large vendors with many BES customers will balk, sooner or later, at being asked to respond to a multitude of risk assessment requests, questionnaires, meetings, etc., each one different from the previous ones, and will instead incline towards providing a standardized set of information about their internal risk management programs and how they are applied to their products and services.	
Likes 0	
Dislikes 0	
Response. Thank you for your comment. The examples in the Implementation Guidance describe some ways to be compliant with CIP-013-1. The SDT agrees that the examples may not be the most efficient or effective approaches for all responsible entities. The SDT believes including relevant cyber security topics in the procurement processes will provide reliability benefit even if some vendors do not provide all of the desired information or support requested terms.

By placing those comments and guidance in the Implementation Guidance does not provide industry protection during an audit in defining ‘cost effective manner’. If it is important to communicate to industry that Supply Chain Management can be managed in a ‘cost	

effective manner', then that should be detailed in the standards. 'Cost effective manner' is an undefined term and will be different for each entity, budget and their resources. The focus should be modified to a 'risk reduction manner' or 'risk appropriate manner'.

This new standard will put additional burden on entities. It is going to take considerable time to implement and negotiate new contracts. It is also up to the entity to provide adequate documentation to prove compliance but it will still be based on the auditor discretion if an entity has done enough. As with similar requirements in the nuclear industry we believe that contract pricing will increase due to the Standard requirements placed on the vendors via industry and may result in reduction of vendor options.

N&ST believes the approaches to meeting CIP-013's reliability objectives described in the Implementation Guidance could easily consume scores, if not hundreds, of staff hours, with the potential to make "vendor risk assessment(s)" a significant cost component of any large-scale procurement. N&ST notes that although most of the documents referenced in the Guidance document are available for download at no charge, the Shared Assessment Program's Standardized Information Gathering (SIG) questionnaire, referenced in a footnote, must be purchased for $6,000. The Guidance document does point out that a Responsible Entities are free to pursue different approaches to CIP-013 implementation that "better fit their situation," but provides no examples of alternatives that might be worth considering. N&ST encourages NERC and the SDT to consider how utilities with very small staffs and very limited budgets might reasonably address their CIP-013 obligations.

BC Hydro does not agree that implementing this standard will be cost effective. Costs and contract management to enforce CIP-013 on all vendors, in light of the limited authority the responsible entity would have over vendors, are anticipated to be significant. Especially, but not limited too, in situations where there is limited vendor choice for a class of product.

CHPD believes that the language proposed in CIP-013-1 Draft 2 will result in vendor costs that outweigh, or possibly reverse, the current security and reliability of the BES. Vendors are likely to (1) significantly increase quoted implementation costs, (2) counter terms with alternate language that may not comply with the Standard, or (3) elect to no longer do business with small-to-medium sized entities due to added contractual complexity. Vendors are not subject to enforcement and therefore should not be identified in any CIP Standards. As a result, CHPD proposes that the requirements be written in a less prescriptive manner that enables entities responsible for CIP-013 compliance to have control over the process through the use of performance-based activities. The performance-based assessment requirements would be improved if worded in a way that allows the acceptance of any outcome reached by each Responsible Entity (e.g., "Each Responsible Entity shall <insert performance activity> and document the results of the assessment."). The intent should be to create a dialog between the entities and vendors on these topics rather than just documented within contractual language.

By not clarifying “cyber security risks” in R1 Part 1.1 the SDT is not providing flexibility, but rather compliance risk to Registered Entities. See our comments to questions 1 and 7, above, regarding the Implementation Guidance. As it stands, the document provides no guidance and raises additional, possible compliance risk as to interpretation of what “cyber security risks” are.

CHPD believes that the language proposed in CIP-013-1 Draft 2 will result in vendor costs that outweigh, or possibly reverse, the current security and reliability of the BES. Vendors are likely to (1) significantly increase quoted implementation costs, (2) counter terms with alternate language that may not comply with the Standard, or (3) elect to no longer do business with small-to-medium sized entities due to added contractual complexity.

Vendors are not subject to enforcement and therefore should not be identified in any CIP Standards. As a result, CHPD proposes that the requirements be written in a less prescriptive manner that enables entities responsible for CIP-013 compliance to have control over the process through the use of performance-based activities.

The performance-based assessment requirements would be improved if worded in a way that allows the acceptance of any outcome reached by each Responsible Entity (e.g., “Each Responsible Entity shall <insert performance activity> and document the results of the assessment.”). The intent should be to create a dialog between the entities and vendors on these topics rather than just documented within contractual language.

Avista agrees with the SDT's belief that the proposed CIP-013-1 and the ERO Enterprise-Endorsed Implementation Guidance provide entities with flexibility to meet the reliability objectives in a cost effective manner. However, the cost effectiveness of the standard will ultimately depend on how Responsible Entities implement the standard and how NERC and the Regional Entities enforce the requirements. In addition to the Implementation Guidance, the policy guidance that NERC staff and the Standards Committee are drafting to clarify the principles, development, and use of the Guidelines and Technical Basis will also be very important to how Responsible Entities implement the requirements.

We support the changes and believes that most aspects of CIP-013 may be achieved cost-effectively (if not necessarily cheaply), with two exceptions.

One exception is if the eventually determined audit approach to CIP-013 effectively precludes use of regional master contracts and piggyback agreements, then cyber asset procurement expenses will increase for municipal utilities, smaller entities and co-ops, and other public utilities with little or no benefit. Costs will increase for (i) the procurement process itself, because utilities will need to research specifications and develop contracts individually in place in pre-negotiated master agreements, and for (ii) each purchase, because aggregated buying power and large-purchase discounts will be lost. To minimize these risks, USI strongly urges that audit approach language for CIP-013 R2 be clarified as to clearly identify the acceptable use of master agreements rather than leave this determination up to individual regions and auditors.

The other exception is the implementation of CIP-005 R2.4 and R2.5 (methods to detect and disable remote access for vendors and vendor system) for existing BES Cyber Systems. Some legacy cyber systems are inherently structured and configured for vendor access, and reworking them to allow real-time detection and, especially, disabling of such access may prove extremely costly. At the same time, these changes may degrade the performance of these systems. USI suggests that the option for a Technical Feasibility Exception be allowed for legacy systems, or that legacy systems be granted an extended implementation period of up to five or ten years (during which such systems likely would be replaced).

In the Draft CIP-013-1 – Cyber Security - Supply Chain Risk Management requirement R2 includes the following: "Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract." With this note the Responsible Entity is basically directed to develop a plan yet it does not have to change procurement results. If you are not going to require results, there is no reason to add the costs of developing and implementing the program.

At this point of the project, it is too early to comment on cost effectiveness. Exelon does not predict that the implementation of CIP-013 will require significant investment. However, implementing tools and processes for the revisions to CIP-005 and CIP-010 may require project management oversight as well as material financial investment.

The current version of the cybersecurity supply chain standard provides a starting point for advancing controls to mitigate the risks associated with vulnerabilities in the supply chain. PJM Interconnection, LLC ("PJM") is supportive of this proposed standard as a first step consistent with the overall direction provided by the FERC. *PJM wishes to point out that the proposed supply chain standard needs to further evolve through subsequent iterations based on additional experience and incorporation of best practices. Although PJM recognizes the limits of FERC's jurisdiction as it relates to*

suppliers to owners and operators of the bulk electric system, any effective supply chain management standard should work to create incentives for improved cybersecurity practices up the supply chain and not just place requirements on the end user (in this case the owner or operators of bulk electric system assets). Although not evident on its face, PJM is hopeful that the proposed Standard will adequately and timely incent that goal. However, as a first step, the impact of the proposed standard, once implemented, should be analyzed with this goal in mind.

In order for supply chain risks to be substantially mitigated it will require broader cross sector engagement, broad government engagement and a significant shift in how vendors and service providers deliver products and services. Broader engagement is also required to ensure an equitable allocation of liabilities and costs. Eventually vendors and service providers will differentiate themselves by how well they manage cybersecurity risks and meet these customer needs in a fair and responsible manner.

Directionally, the proposed cybersecurity supply chain standard was intended to address a broad range of technologies as opposed to a narrower view of Energy Management and Market Management System vendors. The FERC directive similarly appeared to drive this approach. By making this choice of applying the standard to a broader range of technologies the standard, almost by necessity, starts with a more general approach with is not overly prescriptive and is grounded on the principle that organizations must establish cybersecurity supply chain processes and then execute against those processes.

The standard could have been much more prescriptive had it taken a narrower approach focusing primarily on SCADA Systems, Energy Management Systems, and Market Management Systems software solutions. Clearly the more narrow approach would have allowed for additional focus on those systems most critical to ISO/RTO operations where more proscription could have been helpful to drive more specific cybersecurity controls up the supply chain. Whether a broad approach as chosen by the drafting team or a more targeted approach is better as a starting place can be legitimately debated. In any event, either can provide a starting point for making improvements in managing the cybersecurity supply chain threats. PJM believes this effort meets that initial 'out of the gate' requirement given the need for compliance with the FERC Order in a discrete time period.

Support of the cybersecurity supply chain standard will provide an incremental step in achieving our objective of significantly improving the risks associated with vulnerabilities in the supply chain.

1) Make 'vendor' a defined term or provide GTB explanation for what is expected to be considered a vendor. 2) Guidelines and Technical Basis for CIP-013-1 states that it is sufficient to establish a reliable software update source once to allow automated solutions to be implemented. Does this reasoning extend to manual patching? For non-automated systems can a reliable software update source be identified once? 3) Please provide implementation guidance on CIP-005 and CIP-010 4) Make 'integrity' a defined term or provide GTB explanation for what is expected for verifying integrity of software. 5) Please list practical ways to validate the integrity of software.

: The SDT doesn't address CIP Exceptional Circumstance (CEC) in any of the Supply Chain Standards. If an event does occur that creates a CEC, it could potentially cause an entity to not be able to monitor vendor remote access verification of software integrity and authenticity.

In Order No. 829, it states, "new or modified Reliability Standard to require each affected entity to develop and implement a plan that includes security controls for supply chain management for industrial control system hardware, software, and services associated with bulk electric system operations."

Does the drafting team have confidence that only having in scope medium and high BES Cyber Assets meets the directive for "industrial control system hardware, software, and services"?

ACES recommends additional verbiage be written in the requirements to document what cyber assets that are not in scope for Supply Chain Management such as: Electronic Access Control and Monitoring Systems (EACMS), transient cyber assets, removable media and protected cyber assets (PCA).

Thank you for your time and consideration.

Response. Thank you for your comment.

The SDT does not believe the proposed requirements need to include exceptions for CIP Exceptional Circumstances as discussed in previous sections.

The SDT believes the scope is appropriate, as discussed in response to Question 7.

The SDT does not believe it is necessary to expand on the list of exemptions; rather, the SDT has included the applicability in the appropriate section of the standard, and in the requirements themselves. This approach is consistent with other Reliability Standards.

The Guidelines and Technical Basis section heading Software and Authenticity, paragraph three on page 39, states: "It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches." The requirement wording suggests it applies for any change but the guidance suggests that for some changes, such as patches, it would not apply. As the requirement is auditable and the guidance is not, the guidance becomes superfluous. The Guideline also introduces significant ambiguity that is impossible to audit. Therefore, the IRC suggest that either the requirement wording be adjusted to allow for automated patching solutions or the Guideline be removed as it is contradictory. The IRC suggest that automated patch deployment solutions should be able to verify the identity and integrity of the patch. Therefore the best solution is to remove the guideline.

Response. Thank you for your comment. The SDT has revised the section in CIP-010-3 to remove the ambiguous material.	

IESO	
Answer	YES
Document Name	
Comment	

There appears to be inconsistency between the requirement and the Guidelines in CIP-010 R1.

The requirement states “For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5”.

The Guidelines and Technical Basis section heading Software and Authenticity, paragraph three on page 39, states: “It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches.”

The requirement wording suggests it applies for any change but the guidance suggests that for some changes, such as patches, it would not apply. As the requirement is auditable and the guidance is not, the guidance becomes superfluous. The Guideline also introduces significant ambiguity that is impossible to audit.

Therefor the IESO suggest that either the requirement wording be adjusted to allow for automated patching solutions or the Guideline be removed as it is contradictory. The IESO suggest that automated patch deployment solutions should be able to verify the identity and integrity of the patch. Therefore the best solution is to remove the guideline.

Note: the following comment is the same as identified for question 2.

We note there is no corresponding “Guidance and Technical Basis” or “Rationale” for CIP-005-6 Requirement R2 Parts 2.4 and 2.5.

Response. Thank you for your comment.

1. The proposed standards will benefit reliability and enhance the existing body of CIP Reliability Standards by addressing supply chain cyber security risks to applicable medium and high impact BES Cyber Systems. The effort is in recognition of the significant and evolving threats to the cyber security of BES Cyber Systems in the supply chain. The proposed standards are responsive to FERC Order No. 829 and support a defense-in-depth strategy by adding planning and procurement obligations to "post-acquisition activities at individual entities" (Order No. 829, P. 34).
2. The proposed standards address the four supply chain cyber security objectives in Order No. 829 (software integrity and authenticity; vendor remote access; information system planning; and vendor risk management) through requirements for responsible entities to implement various planning and procurement processes and operating measures. Consistent with the Order, the proposed standards provide responsible entities with flexibility to determine how to meet the reliability objectives (Order No. 829, P. 2). Flexibility is needed due to the diverse population of responsible entities, the variety of systems and services covered by the standards, entity and vendor-specific procurement processes involved, and the evolving nature of cyber security supply chain risks and mitigation.
3. The proposed standards and Order No. 829 directing their development are informed by pertinent threat advisories and information (Order No. 829, P. 26). As discussed above, the proposed requirements provide entities with flexibility for achieving the objectives and avoid prescriptive measures that may not provide reliability benefits or deliver the most efficient or effective approach. Instead, the standards and Implementation Guidance reference current technical guidance where appropriate.
4. The SDT believes prioritizing high and medium impact BES Cyber Systems in the supply chain cyber security risk management standards is an appropriate approach to meeting the directives in FERC Order No. 829 and focuses industry resources on protecting the most impactful BES Cyber Systems. See response to Question 4 comments. Security of communications is not in scope for this project.

5. As discussed above, the proposed standards support a defense-in-depth strategy by adding planning and procurement obligations for responsible entities to other CIP cyber security practices. The SDT's approach is in line with FERC Order No. 829, which stipulates that the standards should not impose obligations directly on vendors (Order No. 829, P 36). 6. The SDT is addressing the concern with potentially varying compliance interpretations by developing Implementation Guidance. The ERO Enterprise has endorsed the CIP-013-1 Implementation Guidance in accordance with NERC's Compliance Guidance policy. As a result, responsible entities have a vetted example of a compliant approach to support compliance monitoring activities. 7. Approved CIP standards contain requirements for mitigating malicious code and reporting cyber security incidents. Project 2016-03 is focused on the objectives contained in the project Standard Authorization Request and Order No. 829.

ERCOT joins the comments of the IRC and offers the following additional comment:

The term "vendor" that is used repeatedly in the rationale boxes requires further clarification or revision. "A *vendor*, as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators."

Services cannot be manufactured, and the provision of services is already addressed through item (ii). ERCOT suggests the following revision: "A *vendor*, as used in the standard, may include: (i) developers or manufacturers of information systems or components; (ii) *providers of information systems services*; (iii) product resellers; or (iv) system integrators."

Patrick Hughes - National Electrical Manufacturers Association - NA - Not Applicable - NA - Not Applicable	
Answer	
Document Name	NEMA Comments on NERC Supply Chain Risk Management 2017-06-12.pdf

Comment
On behalf of the National Electrical Manufacturers Association (NEMA)—a trade association and standards developing organization with nearly 350 member companies that manufacture a diverse set of products used in the generation, transmission, distribution, and end-use of electricity—and on behalf of the NEMA Grid Modernization Leadership Council and the NEMA Cybersecurity Committee, I wish to submit for your reference "CPSP 1-2015: Supply Chain Best Practices," which describes industry best practices for manufacturers to follow regarding cybersecurity supply chain management. "Supply Chain Best Practices" identifies guidelines that electrical equipment manufacturers can implement during product development to minimize the possibility that bugs, malware, viruses or other exploits can be used can be used to negatively impact product operation. It addresses United States supply chain integrity through four phases of a product's life cycle: manufacturing, delivery, operation, and end-of-life. The report (attached) is available for public download at: http://www.nema.org/Standards/Pages/Supply-Chain-Best-Practices.aspx.

The National Electrical Manufacturers Association and its members understand that a secure supply chain is essential to a secure grid and that cybersecurity aspects should be built into, not bolted onto, manufacturers' products. They also understand that managing cybersecurity supply chain risk requires a collaborative effort and open lines of communication among electric utility companies and the manufacturers of critical electric grid systems and components—both hardware and software. NEMA looks forward to working with and being a resource for NERC, utilities, and other interested stakeholders in addressing supply chain risks and concerns within the energy sector. Should you have any questions, please contact Patrick Hughes, Senior Director of Government Relations and Strategic Initiatives, at 703-841-3205 or patrick.hughes@nema.org. Respectfully, Kyle Pitsor Vice President, Government Relations

The American Council of Engineering Companies (ACEC) -the business association of the nation's engineering industry - wants to convey the industry's perspectives and concerns over the development of this new cyber security supply chain rule mandated by the Federal Energy Regulatory Commission (FERC). ACEC members firms, numbering more than 5,000 and representing over 500,000 employees throughout the country, are engaged in a wide range of engineering work that propel the nation's economy, and enhance and safeguard America's quality of life. Council members are actively involved in every aspect of the energy marketplace. Supply chain cyber security is of growing concern to all our members. ACEC is in agreement with most of the comments of the owners, operators, vendors and suppliers that have formally participated in this Standard development.

Additional comments received from Seattle City Light

1. The SDT has revised requirements for developing and implementing supply chain cyber security risk management plans (CIP-013-1 Requirements R1 – R3) in response to stakeholder comments. Do you agree with the proposed requirements? If you do not agree, or if you agree but have comments or suggestions for the proposed requirements, please provide your recommendation and explanation.

☒ Yes
☐ No

Comments: *Note that for all comments (1-9) written in blue text come directly from APPA and/or LPPC comments. Any comments in black are City Light's.*

Seattle City Light continues to be a strong supporter of efforts to ensure the security of the Bulk Electric System and appreciates the time and effort that the SDT has put into considering industry feedback and incorporating it into the current drafts of CIP-005, CIP-010 and CIP-013.

Seattle agrees with limiting the requirement to high and medium assets only.

R1: Seattle generally agrees with the proposed Requirement 1 but is concerned about compliance obligations for procurement activities associated with multi-party wide-area contracts, master agreements and piggyback agreements. An exception, comparable to a CIP Exceptional Circumstance, might be included in the standard for these kinds of procurement activities. Alternatively, concerns about how different type of contracts—multi-party contracts, master agreements, evergreen agreements, piggyback contracts, long-term service agreements, etc, etc, etc—may or may not comply might be addressed by re-positioning CIP-013 as a performance-based Standard, with a focus on managing specific aspects of vendor security rather than particular contracting practices.

Our reasoning is that there are means other than vendor contract negotiations, contract language, and procurement processes to address and (attempt to) achieve the protections identified in R1.2. It is immaterial how these protections are pursued. Focusing vendor security plans and audit approaches on contracts and procurement (even if specific contract terms are not in scope) limits flexibility, is unnecessarily prescriptive, and does not reflect performance-based principles. As such we suggest that R1.2 be revised as follows:

> ***1.2.*** *One or more process(es) for its newly procured BES Cyber Systems that address the following elements, as applicable:*

As explanation for the revisions, underlined words are added, and "newly" is intended to mean 'obtained after the implementation of CIP-013.' Also, the term "elements," as shown above, is added to more clearly align with the VSLs for this requirement.

At the same time guidance associated with the "Rationale for R1," "Rationale for R2," and the separate Implementation Guidance document should be revised to reflect the change to a performance-based requirement in which contract terms and contract negotiations play no necessary function in vendor security plans and audit approaches. Contract terms might be used by an entity in their vendor security plans and/or as evidence of performance, but there should be no expectation by auditors or subtext in the Standard or Implementation Guidance that anything having to do with contracts or procurement processes is required. There should be no expectation of what might or should be included within Requests for Proposals, no expectation of when contracts might or should be renegotiated, no expectations of what contract terms might or should be included or requested, and no expectations of what terms might or should be found in a prudent and proper contract. Ultimately there should be no expectation that CIP-013 R1.2 protections be achieved through the contracting process. Consistent with performance-based standard principles the objective in CIP-013 and in entity vendor security plans should be on achieving each protection (as feasible), not on the means by which it is achieved (or attempted to be achieved).

In the absence of such changes, we request substantial additional clarification about how, without contract terms and contract negotiations being auditable, performance of R2 implementation will be audited and assessed. In particular for state and regional master agreements, piggyback contracts, evergreen agreements, and the like.

Looking to specific details of CIP-013 requirements, Seattle requests re-wording of R1 parts 1.2.1 and 1.2.4 to better understand what is expected. These parts appear to be duplicative. The endorsed Guidance does not adequately distinguish between the two parts. One interpretation is that part 1.2.1 is for products/services and that part 1.2.4 is for vulnerabilities in the product. It is not clear if these parts expect information sharing at the time of procurement or if information sharing will be on-going?

In R1 parts 1.2.1 and 1.2.2, the term "vendor-identified incident" is unclear. It could mean incidents that were identified by another party, specific to the products of a specific vendor, or incidents identified by the vendor. Seattle suggests changing "identified" in the phrase, to "acknowledged" or "confirmed" to ensure clarity.

Definition of vendor is not a NERC defined term. The term "vendor" is also used in the proposed CIP-005.

Seattle believes the SDT should provide guidance regarding the use of the term "vendor." If "Vendor" is not defined by NERC, the Guidance should recommend that entities include their definition of "vendor" in their plan(s).

Seattle recommends removing those items (CIP-013 R1 parts 1.2.5 and 1.2.6) covered in CIP-005 and CIP-010 from CIP-013 to avoid duplication. The revised CIP-013 parts 1.2.5 and 1.2.6 appear to apply to software source and identity verification (now required "when the method to do so is available" by CIP-010) and determining active vendor remote access sessions (now required by CIP-005). Having CIP-013 parts that require entities to perform the underlying function and to take those functions into account during the procurement process is needless duplication that does not increase security or reliability and could result in compliance "double jeopardy."

R2: Seattle agrees with the requirement to implement the supply chain cyber security risk management plan as outlined in Requirement 1.

As discussed above, Seattle urges the significant additional guidance, preferably centered on performance-based principles, about expected compliance practices and how implementation will be audited. In particular for state and regional master agreements, piggyback contracts, evergreen agreements, and the like.

Finally, the Compliance and/or Implementation Guidance should make clear that, when evidence demonstrates that all items expressly identified in CIP-013, R1 are contained in a Supply Chain Cyber Security Management Plan or Plans, and are implemented pursuant to R2, entities will not be found out of compliance. More specifically, entities should not be subjected to CIP-013 noncompliance findings resulting from a difference of opinion concerning security adequacy.

R3: Seattle agrees that a 15-month review period is appropriate to review the supply chain cyber security risk management plan in Requirement 1.

Additionally, Seattle proposes that the regional entities voluntarily assess CIP-013 programs for entities who have audits in the period between standard approval and the effective date. This is similar to when the regional entities performed transition period audits of CIP v5 programs.

2. The SDT developed proposed CIP-005-6 Requirement R2 Parts 2.4 and 2.5 to address the Order No. 829 directives for controls on vendor-initiated remote access to BES Cyber Systems covering both user-initiated and machine-to-machine vendor remote access. The SDT followed

an approach recommended by stakeholders during the initial posting of CIP-013-1. Do you agree with proposed revisions in CIP-005-6? If you do not agree, or if you agree but have comments or suggestions, please provide your recommendation and explanation.

☒ Yes
☐ No
Comments: *Note that comments identified in blue text come directly from APPA and/or LPPC comments.*

The proposed CIP-005-6 uses the term, "vendor." The definition of vendor is not a NERC defined term. Seattle City Light believes the SDT should provide guidance regarding the use of the term "vendor." If "Vendor" is not defined by NERC, the Guidance should recommend that Entities include their definition of "vendor" in their plan(s).

Seattle agrees with R2 Part 2.4 but requests clarification of the term "determining."

Seattle generally agrees with Proposed R2 Part 2.5 but requests revisions to the Rationale for R2. The last sentence of paragraph 2 of the rationale states the objective "is for entities to have the ability to rapidly disable active remote access sessions…" The Responsible Entity may not have the capability to disable access during an "active" remote access session. Seattle requests changing the language to "upon detected unauthorized activity."

Guideline & Technical Basis (GTB) for R2 should be included in this revision. Supplemental materials may be out of date – see page 21 of 24 in the posted redline version. Please Include reference to FERC Order 829 for parts 2.4 and 2.5.

The SDT should consider adding a CIP Exceptional Circumstance clause to R2 parts 2.4 and 2.5

3. The SDT developed proposed CIP-010-3 Requirement R1 Part 1.6 to address the Order No. 829 directive for entities to address verification of software integrity and authenticity in the BES Cyber System environment (P 48). The SDT followed an approach recommended by stakeholders

during the initial posting of CIP-013-1. Do you agree with proposed revisions in CIP-010-3? If you do not agree, or if you agree but have comments or suggestions for the proposed requirement, please provide your recommendation and explanation.

☒ Yes
☐ No
Comments: *Note that comments identified in blue text come directly from APPA and/or LPPC comments.*

Seattle City Light agrees this requirement belongs in CIP-010 R1. Seattle generally agrees with Proposed R1 Part 1.6, but request the following items be addressed by the SDT:

- Seattle recommends the Guidelines and Technical Basis section is updated to reflect current information.
  - The requirement states "For a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5…," indicating the authenticity and integrity of the specified parts need to be verified each time there is a change to a baseline for those parts. The proposed requirement would possibly involve entities duplicating effort for every case for which such verification had to be undertaken (i.e., in the cases of multiple installations of software across many applicable Cyber Assets). This does not seem consistent with the intent of the protection and could present an undue compliance burden without providing the intended protection. We believe that the existing statement in the GTB provides clarity on this issue and request that it not be removed. From the GTB: "It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches."
  - Seattle also recommends the language of the requirement be re-worded to reflect the intent of the GTB, as an auditor audits to the requirement, not the GTB. Doing a verification of authenticity and integrity for each change to the baseline for the specified parts would be tedious and require entities to acquire additional resources to perform the work.
- There is no guidance on how to verify the identity (authenticity). Performing this verification could be difficult if the software/patch comes from a third-party tool. Guidance on how this can be done needs to be made available to entities in order to perform an evaluation of the work and resources involved to achieve this requirement. Hashing was given as an example during an industry webinar, but this is not realistic for each type of system.
- Additional examples of acceptable measures should to be listed, in particular for R1.6.1 and R1.6.2. Additionally, Seattle requests examples of acceptable evidence when there is not a method available to verify the identity of the software source.
- While Seattle supports these changes, clarification is required about how new R1.6 applies to entirely new BES Cyber Systems (BCS), i.e., BCS that are newly implemented, have not previously had a baseline, and thus do not have an existing baseline for a change to

deviate from. We expect that R1.6 is intended to apply to new BCS as well as to existing BCS, but as written the requirement does not. Please clarify to avoid implementation confusion and minimize audit challenges.

4. The SDT removed low-impact BES Cyber Systems from the applicability in CIP-013-1 and is not proposing any new requirements for these cyber systems. The SDT believes that the proposed applicability to high and medium impact BES Cyber Systems appropriately focuses industry resources on supply chain cyber security risk management for industrial control system hardware, software, and computing and networking services associated with BES operations, as specified in Order No. 829. Do you agree with the SDT's removal of low impact BES Cyber Systems from CIP-013-1? If you do not agree, or if you agree but have comments or suggestions, please provide your recommendation and explanation.

☒ Yes
☐ No

Comments: Seattle City Light agrees with the removal of low-impact BES Cyber Systems from CIP-013-1 and agrees that the current standard as written appropriately addresses the Commission's concerns as specified in Order No. 829. Among other things, the Order requests a risk-based approach. Application of Standard CIP-002 is an established, Commission-approved approach to categorize a utility's BES Cyber Systems into high, medium, and low risk classifications. Application of this established risk-based approach to cyber asset procurement for electric utilities is natural, appropriate, and consistent with the guiding CIP philosophy, stated in Section 6 of each CIP Standard, that each Standard "exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems."

Furthermore, Seattle believes that for entities that have a mixture of High, Medium and Low assets, the Low assets would inherently benefit from the additional requirements of Medium and High requirements as a matter of normal business practices. Additionally, many Contracts and Master Agreements are developed for all products and services purchased from a vendor. For Entities that have Low assets only, there would not be additional requirements based on CIP-002 risk based approach, as appropriate to the low BES risk presented by these entities.

Seattle believes that including Lows will require substantial resources by each Responsible Entity to identify and maintain an inventory list of these items, beyond the benefit provided by additional controls. Existing controls inherent to CIP-003 and previous CIP Standards reduce the risk associated with Lows.

5. The SDT revised the Implementation Plan in response to stakeholder comments. Do you agree with the Implementation Plan for the requirements in Project 2016-03? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan, please provide your recommendation and explanation.

☒ Yes
☐ No
Comments: *Note that comments identified in blue text come directly from APPA and/or LPPC comments.*

Seattle City Light generally agrees with an 18-month implementation plan but, would prefer a 24-month implementation plan. Seattle feels that a 24-month timeframe is more appropriate and gives the entity additional time to align budgets and develop processes with vendors and suppliers.

Seattle, in line with our recommendation to move CIP-013 to a performance-based standard as discussed in Question 1 above, also recommends deleting discussion of contracts and contract dates from implementation guidance, and focusing the guidance on BES Cyber Assets procured subsequent to the implementation date of the standard. If performance-based principles are not adopted, Seattle at least asks for clarity to change this General Consideration from:

> *Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in the contract do not determine whether the contract is within scope of CIP-013-1.*

To:

> *Supply Chain Risk Management plan must be used by appropriate procurement processes that begin on or after the implementation date.* (Also make corresponding change to the associated note in CIP-013 R2.)

Further, Seattle requests clarification on if/when existing contracts, master contracts, or long-term maintenance agreements that may be re-opened for renegotiation or later put in use (e.g., a state master contract negotiated prior to the CIP-013 implementation date but not actually used by a utility until after CIP-013 implementation date), come into the scope of CIP-013. Seattle notes that shifting to a performance-based Standard, focused on specific vendor protections and not the means that such protections are achieved (i.e., contracts) would minimize the explanations required about such matters.

The Implementation Plan does not handle unplanned changes such as newly identified IROLs or registration changes, etc, that may bring an entity suddenly into scope for CIP-013, CIP-005 R2.4-2.5, and/or CIP-010 R1.6. Seattle therefore requests that the Implementation Plan be modified to address, in a reasonable way, how entities come into compliance if, due to changes, they newly meet applicability at some time after the effective date of the standards.

6. The SDT revised the Violation Severity Levels (VSLs) for requirements in CIP-013-1, CIP-005-6, and CIP-010-3. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the proposed requirements? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs, please provide your recommendation and explanation.

☐ Yes
☒ No
Comments: *Note that comments identified in blue text come directly from APPA and/or LPPC comments.*

Seattle City Light agrees with the VRFs and VSLs for CIP-013. As discussed above under Question 1, Seattle requests that the term "elements" be included in CIP-013 R1.2 to clearly align with the VSLs for this requirement.

For CIP-010, Seattle does not find that the VSL covers failures to implement the process. It therefore does not include all possible combinations of violation. Consequently, we request that there be an identified severity level for failure to implement and lower severity levels when a single aspect of the requirements is missing.

For CIP-005, Seattle believes that the VRFs and VSLs should be updated to reflect the same general structure used in CIP-010. The VSL for CIP-005 results in a "Severe" penalty if the entity did not have a method to determine and did not have a method to disable. Seattle would prefer a "High" VSL penalty if the entity has a process to determine but does not have a process to disable, and vice-versa if the entity did not have a process to determine but does have a process to disable.

7. The SDT developed draft Implementation Guidance for CIP-013 to provide examples of how a Responsible Entity could comply with the requirements. The draft Implementation Guidance does not prescribe the only approach to compliance. Rather, it describes some approaches the SDT believes would be effective ways to comply with the standard. See NERC's Compliance Guidance policy for information on

Implementation Guidance. Do you agree with the example approaches in the draft Implementation Guidance? If you do not agree, or if you agree but have comments or suggestions for the draft Implementation Guidance, please provide your recommendation and explanation.

☐ Yes
☒ No
Comments: *Note that comments identified in blue text come directly from APPA and/or LPPC comments.*

Seattle City Light generally agrees with the Implementation Guidance for CIP-013 and feels that this is a promising new approach but is uncertain if the approach best provides assurance and guidance about these new Standards in the absence of the "Guidance and Technical Basis" sections in each Standard and the intentional flexibility of CIP-013 in particular. Seattle is concerned about the possibilities that NERC and the Regions may withdraw previously-granted endorsement should FERC request revisions to the Standard. As such, Seattle would prefer to see the new "Implementation Guidance Document" supplemented with "Guidance and Technical Basis" sections in each Standard, including for CIP-005-6 R2.4 and R2.5 and for CIP-010-3 R1.6.

As discussed above, "vendor" is not a NERC defined term. The term "vendor" is also used in the proposed CIP-005. Seattle believes the SDT should provide guidance regarding the use of the term "vendor." If "vendor" is not defined by NERC, the Guidance should recommend that entities include their definition of "vendor" in their plan(s).

Neither of the bullets for R3 in the Implementation Guidance sufficiently explain compliance needs because both bullets only deal with plan review and not approval, both of which are necessary for compliance. Therefore, Seattle recommends changing:

"Below are some examples of approaches to comply with this requirement:"

to

"Below is an example of an approach to comply with the review requirement required by: "

In addition, we recommend deleting the following guidance language from the second main bullet, because it is beyond the Requirement and introduced activities that are not explicitly required:

"Upon approval of changes to the supply chain cyber security risk management plan(s), the CIP Senior Manager or approved delegate should provide appropriate communications to the affected organizations or individuals. Additionally, communications or training material may be developed to ensure any organizational areas affected by revisions are informed."

8. The SDT believes proposed CIP-013-1 and the draft Implementation Guidance provide entities with flexibility to meet the reliability objectives in a cost effective manner. Do you agree? If you do not agree, or if you agree but have suggestions for improvement to enable additional cost effective approaches, please provide your recommendation and, if appropriate, technical justification.

☒ Yes
☐ No
Comments: *Note that comments identified in blue text come directly from APPA and/or LPPC comments.*

Seattle City Light generally agrees that the entities can meet the reliability objectives in a cost effective manner for CIP-013-1 with two exceptions.

One exception is if that if, due to uncertainty, anticipated audit risk, an eventually established audit approach, or any other reason, Standard CIP-013 precludes or has a chilling effect on use of regional master contracts and piggyback agreements, then cyber asset procurement expenses will increase for municipal utilities, smaller entities and co-ops, and other publics with little or no benefit. Costs will increase for (i) the procurement process itself, because utilities will need to research specifications and develop contracts individually to replace pre-negotiated master agreements, and for (ii) each purchase, because aggregated buying power and large-purchase discounts will be lost. To minimize these risks, Seattle strongly urges that audit approach language for CIP-013 R2 be clarified in advance to clearly identify the acceptable use of master agreements rather than leave this determination up to individual regions, auditors, time, and chance.

The other exception is the implementation of CIP-005 R2.4 and R2.5 (methods to detect and disable remote access for vendors and vendor system) for existing BES Cyber Systems. Some legacy cyber systems are inherently structured and configured for vendor access, and reworking them to allow real-time detection and, especially, disabling of such access may prove extremely costly. At the same time, these changes may degrade the performance of these systems. Seattle suggests that the option for a Technical Feasibility Exception be allowed for legacy systems, or alternatively that legacy systems be granted an extended implementation period of up to five or ten years (during which such systems likely would be replaced).

9. Provide any additional comments for the SDT to consider, if desired.
Comments: None

End of Seattle City Light Comments

THE FOUNDATION FOR RESILIENT SOCIETIES COMMENTS AS FOLLOWS *ON PROPOSED STANDARD*
2016-03, CYBER SUPPLY CHAIN RISK MANAGEMENT, CIP-005-6, CIP-010-3, AND CIP-013-1:
Filed with NERC June 15, 2017
1. These NERC/SDT attempts to produce a CIP standard for supply chain vulnerabilities fall short in an extreme threat environment. Adversaries' efforts against the electric grid and other civil infrastructure show disdain for U.S. defenses and deep commitment to using Information Operations (including cyber warfare) against the nation. The Bulk Electric System (BES) is a major target—this motivates development of strong capabilities for cyberattack. Adversaries understand full well the dependencies of social and national security institutions and all other critical infrastructures on electric power.

2. There is insufficient substance to the draft standard, other than the usual CIP generalized statements of planning, implementation, and periodic reviews that provide *pro forma* response to FERC Order No. 829. In its 9-1 vote to reject the first draft, the industry sent a clear message to NERC and FERC: the standard requirements are, at present, inadequately defined and therefore the feasibility of cost recovery is hard to judge.

3. Any sincere attempt at compliance with the draft standard requirements by responsible entities will incur high costs with uncertain benefit to the survivability of the BES. The Standard Drafting Team appears to minimize the complexity of the 2014 Russian penetrations of the U.S. BES, its sophisticated multi-layered, years-earlier penetration of vendor's control systems, phishing efforts, firmware modifications, and extensive use of IT vendors' vulnerabilities in operating, communications and networking, and database systems. The draft lacks good protective steps on these vulnerabilities and is therefore inadequate for mitigating risk--especially given the increasing nature of the Russian Havex and BlackEnergy threats evidenced in the follow-on attacks in the Ukraine Grid in 2015 and 2016. Note the recent revelation by ESET and DRAGOS of CRASH OVERIDE malware (associated with the 2016 Ukraine attack) with specific and flexible targeting of "low impact" industrial control systems (ICS). Note also the increasing threat from Distributed Denial of Service (DDoS) IoT and ransomware attacks. To expect several thousand utilities to individually and separately determine self-protective actions under the draft standard is unrealistic. Economies of scale in protection are needed.

4. Exempting "Low Impact" cyber systems leaves vulnerabilities. Also, as Resilient Societies has pointed out on FERC dockets, the exclusion from CIP Standards for all communications and networks between "Electronic Security Perimeters," together with direct internet connectivity to many so-called "low impact" cyber assets, leaves literally thousands of unsecured channels for malware implantation.

5. Stringent application whitelisting/blacklisting and selective third party certification steps, in conjunction with a national deterrence policy, are needed to enhance the minimal-protection from current CIP standards.

6. Ambiguities in standard requirements result in a lack of auditability, as noted by many other commenters.

7. In the short-term, a more practical NERC initiative could be to support a FERC rulemaking to require Bulk Electric System-jurisdictional entities to detect, report, mitigate and remove malware. State PUCs should likewise support a malware mitigation initiative for distribution utilities.

William R. Harris
Foundation for Resilient Societies, Inc.

End of Report

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	October 19, 2016
SAR posted for comment	October 20 - November 21, 2016
45-day formal comment period with ballot	May 2 – June 15, 2017

Anticipated Actions	Date
10-day final ballot	July 2017
NERC Board (Board) adoption	August 2017

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None

Upon Board adoption, the rationale boxes will be moved to the Supplemental Material Section.

A. Introduction

1. **Title:** Cyber Security — Electronic Security Perimeter(s)

2. **Number:** CIP-005-6

3. **Purpose:** To manage electronic access to BES Cyber Systems by specifying a controlled Electronic Security Perimeter in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly. For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-010-3:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes.

5. Effective Date:

See Implementation Plan for Project 2016-03.

6. Background: Standard CIP-005 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the

standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples

may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-005-6 Table R1 – Electronic Security Perimeter*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-005-6 Table R1 – Electronic Security Perimeter* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-6 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP.	An example of evidence may include, but is not limited to, a list of all ESPs with all uniquely identifiable applicable Cyber Assets connected via a routable protocol within each ESP.
1.2	High Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	All External Routable Connectivity must be through an identified Electronic Access Point (EAP).	An example of evidence may include, but is not limited to, network diagrams showing all external routable communication paths and the identified EAPs.

CIP-005-6 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	Electronic Access Points for High Impact BES Cyber Systems Electronic Access Points for Medium Impact BES Cyber Systems	Require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default.	An example of evidence may include, but is not limited to, a list of rules (firewall, access control lists, etc.) that demonstrate that only permitted access is allowed and that each access rule has a documented reason.
1.4	High Impact BES Cyber Systems with Dial-up Connectivity and their associated: • PCA Medium Impact BES Cyber Systems with Dial-up Connectivity and their associated: • PCA	Where technically feasible, perform authentication when establishing Dial-up Connectivity with applicable Cyber Assets.	An example of evidence may include, but is not limited to, a documented process that describes how the Responsible Entity is providing authenticated access through each dial-up connection.

CIP-005-6 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	Electronic Access Points for High Impact BES Cyber Systems Electronic Access Points for Medium Impact BES Cyber Systems at Control Centers	Have one or more methods for detecting known or suspected malicious communications for both inbound and outbound communications.	An example of evidence may include, but is not limited to, documentation that malicious communications detection methods (e.g. intrusion detection system, application layer firewall, etc.) are implemented.

Rationale for Requirement R2:
Proposed Requirement R2 Parts 2.4 and 2.5 addresses Order No. 829 directives for controls on vendor-initiated remote access to BES Cyber Systems covering both user-initiated and machine-to-machine vendor remote access (P. 51). The objective is to mitigate potential risks of a compromise at a vendor during an active remote access session with a Responsible Entity from impacting the BES.

The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. This scope covers all remote access sessions with vendors. The obligation in Part 2.4 requires entities to have a method to determine active vendor remote access sessions. While not required, a solution that identifies all active remote access sessions, regardless of whether they originate from a vendor, would meet the intent of this requirement. The objective of Requirement R2 Part 2.5 is for entities to have the ability to disable active remote access sessions in the event of a system breach as specified in Order No. 829 (P. 52).

The scope of Requirement R2 in CIP-005-6 is expanded from approved CIP-005-5 to address all remote access management, not just Interactive Remote Access. If a Responsible Entity does not allow remote access (system-to-system or Interactive Remote Access) then the Responsible Entity need not develop a process for each of the subparts in Requirement R2. The entity could document that it does not allow remote access to meet the reliability objective.

The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contracts with to supply BES Cyber Systems and related services. It does not include other NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

R2. Each Responsible Entity shall implement one or more documented processes that collectively include the applicable requirement parts, where technically feasible, in *CIP-005-6 Table R2 –Remote Access Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M2. Evidence must include the documented processes that collectively address each of the applicable requirement parts in *CIP-005-6 Table R2 –Remote Access Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-6 Table R2 –Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	For all Interactive Remote Access, utilize an Intermediate System such that the Cyber Asset initiating Interactive Remote Access does not directly access an applicable Cyber Asset.	Examples of evidence may include, but are not limited to, network diagrams or architecture documents.
2.2	High Impact BES Cyber Systems and their associated: • PCA	For all Interactive Remote Access sessions, utilize encryption that terminates at an Intermediate System.	An example of evidence may include, but is not limited to, architecture documents detailing where encryption initiates and terminates.

CIP-005-6 Table R2 –Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
	Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA		
2.3	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	Require multi-factor authentication for all Interactive Remote Access sessions.	An example of evidence may include, but is not limited to, architecture documents detailing the authentication factors used. Examples of authenticators may include, but are not limited to, • Something the individual knows such as passwords or PINs. This does not include User ID; • Something the individual has such as tokens, digital certificates, or smart cards; or • Something the individual is such as fingerprints, iris scans, or other biometric characteristics.

Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	Have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods used to determine active vendor remote access (including Interactive Remote Access and system-to-system remote access), such as: • Methods for accessing logged or monitoring information to determine active vendor remote access sessions; • Methods for monitoring activity (e.g. connection tables or rule hit counters in a firewall, or user activity monitoring) or open ports (e.g. netstat or related commands to display currently active ports) to determine active system to system remote access sessions; or • Methods that control vendor initiation of remote access such as vendors calling and requesting a second factor in order to initiate remote access.

CIP-005-6 Table R2 –Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.5	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	Have one or more method(s) to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods(s) used to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access), such as: • Methods to disable vendor remote access at the applicable Electronic Access Point for system-to-system remote access; or • Methods to disable vendor Interactive Remote Access at the applicable Intermediate System.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.			The Responsible Entity did not have a method for detecting malicious communications for both inbound and outbound communications. (1.5)	The Responsible Entity did not document one or more processes for *CIP-005-6 Table R1 – Electronic Security Perimeter*. (R1) OR The Responsible Entity did not have all applicable Cyber Assets connected to a network via a routable protocol within a defined Electronic Security Perimeter (ESP). (1.1) OR External Routable Connectivity through the ESP was not through an identified EAP. (1.2) OR The Responsible Entity did not require inbound and outbound access permissions and deny all other access by default. (1.3)

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				OR The Responsible Entity did not perform authentication when establishing dial-up connectivity with the applicable Cyber Assets, where technically feasible. (1.4)
R2.	The Responsible Entity does not have documented processes for one or more of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for one of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for two of the applicable items for Requirement Parts 2.1 through 2.3; OR The Responsible Entity did not have either: one or more method(s) for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) (2.4); or one or more methods to disable active vendor remote access (including Interactive	The Responsible Entity did not implement processes for three of the applicable items for Requirement Parts 2.1 through 2.3; OR The Responsible Entity did not have one or more method(s) for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) (2.4) and one or more methods to disable active vendor remote access (including Interactive

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	Update
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-005-5.	
6	tbd	Modified to address certain directives in FERC Order No. 829.	Revised

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. Furthermore,

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

CIP-005-6, Requirement R1 requires segmenting of BES Cyber Systems from other systems of differing trust levels by requiring controlled Electronic Access Points between the different trust zones. Electronic Security Perimeters are also used as a primary defense layer for some BES Cyber Systems that may not inherently have sufficient cyber security functionality, such as devices that lack authentication capability.

All applicable BES Cyber Systems that are connected to a network via a routable protocol must have a defined Electronic Security Perimeter (ESP). Even standalone networks that have no external connectivity to other networks must have a defined ESP. The ESP defines a zone of protection around the BES Cyber System, and it also provides clarity for entities to determine what systems or Cyber Assets are in scope and what requirements they must meet. The ESP is used in:

- Defining the scope of 'Associated Protected Cyber Assets' that must also meet certain CIP requirements.
- Defining the boundary in which all of the Cyber Assets must meet the requirements of the highest impact BES Cyber System that is in the zone (the 'high water mark').

The CIP Cyber Security Standards do not require network segmentation of BES Cyber Systems by impact classification. Many different impact classifications can be mixed within an ESP.

However, all of the Cyber Assets and BES Cyber Systems within the ESP must be protected at the level of the highest impact BES Cyber System present in the ESP (i.e., the "high water mark") where the term "Protected Cyber Assets" is used. The CIP Cyber Security Standards accomplish the "high water mark" by associating all other Cyber Assets within the ESP, even other BES Cyber Systems of lesser impact, as "Protected Cyber Assets" of the highest impact system in the ESP.

For example, if an ESP contains both a high impact BES Cyber System and a low impact BES Cyber System, each Cyber Asset of the low impact BES Cyber System is an "Associated Protected Cyber Asset" of the high impact BES Cyber System and must meet all requirements with that designation in the applicability columns of the requirement tables.

If there is routable connectivity across the ESP into any Cyber Asset, then an Electronic Access Point (EAP) must control traffic into and out of the ESP. Responsible Entities should know what traffic needs to cross an EAP and document those reasons to ensure the EAPs limit the traffic to only those known communication needs. These include, but are not limited to, communications needed for normal operations, emergency operations, support, maintenance, and troubleshooting.

The EAP should control both inbound and outbound traffic. The standard added outbound traffic control, as it is a prime indicator of compromise and a first level of defense against zero day vulnerability-based attacks. If Cyber Assets within the ESP become compromised and attempt to communicate to unknown hosts outside the ESP (usually 'command and control' hosts on the Internet, or compromised 'jump hosts' within the Responsible Entity's other networks acting as intermediaries), the EAPs should function as a first level of defense in stopping the exploit. This does not limit the Responsible Entity from controlling outbound traffic at the level of granularity that it deems appropriate, and large ranges of internal addresses may be allowed. The SDT's intent is that the Responsible Entity knows what other Cyber Assets or ranges of addresses a BES Cyber System needs to communicate with and limits the communications to that known range. For example, most BES Cyber Systems within a Responsible Entity should not have the ability to communicate through an EAP to any network address in the world, but should probably be at least limited to the address space of the Responsible Entity, and preferably to individual subnet ranges or individual hosts within the Responsible Entity's address space. The SDT's intent is not for Responsible Entities to document the inner workings of stateful firewalls, where connections initiated in one direction are allowed a return path. The intent is to know and document what systems can talk to what other systems or ranges of systems on the other side of the EAP, such that rogue connections can be detected and blocked.

This requirement applies only to communications for which access lists and 'deny by default' type requirements can be universally applied, which today are those that employ routable protocols. Direct serial, non-routable connections are not included as there is no perimeter or firewall type security that should be universally mandated across all entities and all serial communication situations. There is no firewall or perimeter capability for an RS232 cable run

between two Cyber Assets. Without a clear 'perimeter type' security control that can be applied in practically every circumstance, such a requirement would mostly generate technical feasibility exceptions ("TFEs") rather than increased security.

As for dial-up connectivity, the Standard Drafting Team's intent of this requirement is to prevent situations where only a phone number can establish direct connectivity to the BES Cyber Asset. If a dial-up modem is implemented in such a way that it simply answers the phone and connects the line to the BES Cyber Asset with no authentication of the calling party, it is a vulnerability to the BES Cyber System. The requirement calls for some form of authentication of the calling party before completing the connection to the BES Cyber System. Some examples of acceptable methods include dial-back modems, modems that must be remotely enabled or powered up, and modems that are only powered on by onsite personnel when needed along with policy that states they are disabled after use. If the dial-up connectivity is used for Interactive Remote Access, then Requirement R2 also applies.

The standard adds a requirement to detect malicious communications for Control Centers. This is in response to FERC Order No. 706, Paragraphs 496-503, where ESPs are required to have two distinct security measures such that the BES Cyber Systems do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear that this is not simply redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs. Technologies meeting this requirement include Intrusion Detection or Intrusion Prevention Systems (IDS/IPS) or other forms of deep packet inspection. These technologies go beyond source/destination/port rule sets and thus provide another distinct security measure at the ESP.

Requirement R2:

See Secure Remote Access Reference Document (see remote access alert).

Rationale

During the development of this standard, references to prior versions of the CIP standards and rationale for the requirements and their parts were embedded within the standard. Upon BOT approval, that information was moved to this section.

Rationale for R1:
The Electronic Security Perimeter ("ESP") serves to control traffic at the external electronic boundary of the BES Cyber System. It provides a first layer of defense for network based attacks as it limits reconnaissance of targets, restricts and prohibits traffic to a specified rule set, and assists in containing any successful attacks.

Summary of Changes: CIP-005, Requirement R1 has taken more of a focus on the discrete Electronic Access Points, rather than the logical "perimeter."

CIP-005 (V1 through V4), Requirement R1.2 has been deleted from V5. This requirement was definitional in nature and used to bring dial-up modems using non-routable protocols into the scope of CIP-005. The non-routable protocol exclusion no longer exists as a blanket CIP-002 filter for applicability in V5, therefore there is no need for this requirement.

CIP-005 (V1 through V4), Requirement R1.1 and R1.3 were also definitional in nature and have been deleted from V5 as separate requirements but the concepts were integrated into the definitions of ESP and Electronic Access Point ("EAP").

Reference to prior version: (Part 1.1) CIP-005-4, R1

Change Rationale: (Part 1.1)
Explicitly clarifies that BES Cyber Assets connected via routable protocol must be in an Electronic Security Perimeter.

Reference to prior version: (Part 1.2) CIP-005-4, R1

Change Rationale: (Part 1.2)
Changed to refer to the defined term Electronic Access Point and BES Cyber System.

Reference to prior version: (Part 1.3) CIP-005-4, R2.1

Change Rationale: (Part 1.3)
Changed to refer to the defined term Electronic Access Point and to focus on the entity knowing and having a reason for what it allows through the EAP in both inbound and outbound directions.

Reference to prior version: (Part 1.4) CIP-005-4, R2.3

Change Rationale: (Part 1.4)
Added clarification that dial-up connectivity should perform authentication so that the BES Cyber System is not directly accessible with a phone number only.

Reference to prior version: (Part 1.5) CIP-005-4, R1

Change Rationale: (Part 1.5)
Per FERC Order No. 706, Paragraphs 496-503, ESPs need two distinct security measures such that the Cyber Assets do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear this is not simple redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs.

Rationale for R2:
Registered Entities use Interactive Remote Access to access Cyber Assets to support and maintain control systems networks. Discovery and announcement of vulnerabilities for remote access methods and technologies, that were previously thought secure and in use by a number of electric sector entities, necessitate changes to industry security control standards. Currently, no requirements are in effect for management of secure remote access to Cyber Assets to be afforded the NERC CIP protective measures. Inadequate safeguards for remote access can allow unauthorized access to the organization's network, with potentially serious consequences. Additional information is provided in ***Guidance for Secure Interactive Remote Access*** published by NERC in July 2011.

Remote access control procedures must provide adequate safeguards through robust identification, authentication and encryption techniques. Remote access to the organization's network and resources will only be permitted providing that authorized users are authenticated, data is encrypted across the network, and privileges are restricted.

The Intermediate System serves as a proxy for the remote user. Rather than allowing all the protocols the user might need to access Cyber Assets inside the Electronic Security Perimeter to traverse from the Electronic Security Perimeter to the remote computer, only the protocol required for remotely controlling the jump host is required. This allows the firewall rules to be much more restrictive than if the remote computer was allowed to connect to Cyber Assets within the Electronic Security Perimeter directly. The use of an Intermediate System also protects the Cyber Asset from vulnerabilities on the remote computer.

The use of multi-factor authentication provides an added layer of security. Passwords can be guessed, stolen, hijacked, found, or given away. They are subject to automated attacks including brute force attacks, in which possible passwords are tried until the password is found, or dictionary attacks, where words and word combinations are tested as possible passwords. But if a password or PIN must be supplied along with a one-time password supplied by a token, a fingerprint, or some other factor, the password is of no value unless the other factor(s) used for authentication are acquired along with it.

Encryption is used to protect the data that is sent between the remote computer and the Intermediate System. Data encryption is important for anyone who wants or needs secure data transfer. Encryption is needed when there is a risk of unauthorized interception of transmissions on the communications link. This is especially important when using the Internet as the communication means.

Summary of Changes: This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.1) New

Change Rationale: (Part 2.1)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.2) CIP-007-5, R3.1

Change Rationale: (Part 2.2)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The purpose of this part is to protect the confidentiality and integrity of each Interactive Remote Access session.

Reference to prior version: (Part 2.3) CIP-007-5, R3.2

Change Rationale: (Part 2.3)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The multi-factor authentication methods are also the same as those identified in the Homeland Security Presidential Directive 12 (HSPD-12), issued August 12, 2007.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	October 19, 2016
SAR posted for comment	October 20 - November 21, 2016
45-day formal comment period with ballot	May 2 – June 15, 2017

Anticipated Actions	Date
10-day final ballot	July 2017
NERC Board (Board) adoption	August 2017

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None

Upon Board adoption, the rationale boxes will be moved to the Supplemental Material Section.

A. Introduction

1. **Title:** Cyber Security — Electronic Security Perimeter(s)

2. **Number:** CIP-005-6

3. **Purpose:** To manage electronic access to BES Cyber Systems by specifying a controlled Electronic Security Perimeter in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly. For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-010-3:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes.

5. Effective Date:

See Implementation Plan for Project 2016-03.

6. Background: Standard CIP-005 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the

standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples

may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-005-6 Table R1 – Electronic Security Perimeter*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-005-6 Table R1 – Electronic Security Perimeter* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-6 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP.	An example of evidence may include, but is not limited to, a list of all ESPs with all uniquely identifiable applicable Cyber Assets connected via a routable protocol within each ESP.
1.2	High Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	All External Routable Connectivity must be through an identified Electronic Access Point (EAP).	An example of evidence may include, but is not limited to, network diagrams showing all external routable communication paths and the identified EAPs.

CIP-005-6 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	Electronic Access Points for High Impact BES Cyber Systems Electronic Access Points for Medium Impact BES Cyber Systems	Require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default.	An example of evidence may include, but is not limited to, a list of rules (firewall, access control lists, etc.) that demonstrate that only permitted access is allowed and that each access rule has a documented reason.
1.4	High Impact BES Cyber Systems with Dial-up Connectivity and their associated: • PCA Medium Impact BES Cyber Systems with Dial-up Connectivity and their associated: • PCA	Where technically feasible, perform authentication when establishing Dial-up Connectivity with applicable Cyber Assets.	An example of evidence may include, but is not limited to, a documented process that describes how the Responsible Entity is providing authenticated access through each dial-up connection.

CIP-005-6 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	Electronic Access Points for High Impact BES Cyber Systems Electronic Access Points for Medium Impact BES Cyber Systems at Control Centers	Have one or more methods for detecting known or suspected malicious communications for both inbound and outbound communications.	An example of evidence may include, but is not limited to, documentation that malicious communications detection methods (e.g. intrusion detection system, application layer firewall, etc.) are implemented.

Rationale for Requirement R2:
Proposed Requirement R2 Parts 2.4 and 2.5 addresses Order No. 829 directives for controls on vendor-initiated remote access to BES Cyber Systems covering both user-initiated and machine-to-machine vendor remote access (P. 51). The objective is to mitigate potential risks of a compromise at a vendor during an active remote access session with a Responsible Entity from impacting the BES.

The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. This scope covers all remote access sessions with vendors. The obligation in Part 2.4 requires entities to have a method to determine active vendor remote access sessions. While not required, a solution that identifies all active remote access sessions, regardless of whether they originate from a vendor, would meet the intent of this requirement ~~as the objective of Part 2.4~~. The objective of Requirement R2 Part 2.5 is for entities to have the ability to ~~rapidly~~ disable active remote access sessions in the event of a system breach as specified in Order No. 829 (P. 52).

The scope of Requirement R2 in CIP-005-6 is expanded from approved CIP-005-5 to address all remote access management, not just Interactive Remote Access. If a Responsible Entity does not allow remote access (system-to-system or Interactive Remote Access) then the Responsible Entity need not develop a process for each of the subparts in Requirement R2. The entity could document that it does not allow remote access to meet the reliability objective.

The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contracts with to supply BES Cyber Systems and related services. It does not include other NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

R2. Each Responsible Entity shall implement one or more documented processes that collectively include the applicable requirement parts, where technically feasible, in *CIP-005-6 Table R2 –Remote Access Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M2. Evidence must include the documented processes that collectively address each of the applicable requirement parts in *CIP-005-6 Table R2 –Remote Access Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-6 Table R2 –Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	For all Interactive Remote Access, utilize an Intermediate System such that the Cyber Asset initiating Interactive Remote Access does not directly access an applicable Cyber Asset.	Examples of evidence may include, but are not limited to, network diagrams or architecture documents.
2.2	High Impact BES Cyber Systems and their associated: • PCA	For all Interactive Remote Access sessions, utilize encryption that terminates at an Intermediate System.	An example of evidence may include, but is not limited to, architecture documents detailing where encryption initiates and terminates.

CIP-005-6 Table R2 –Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
	Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA		
2.3	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	Require multi-factor authentication for all Interactive Remote Access sessions.	An example of evidence may include, but is not limited to, architecture documents detailing the authentication factors used. Examples of authenticators may include, but are not limited to, • Something the individual knows such as passwords or PINs. This does not include User ID; • Something the individual has such as tokens, digital certificates, or smart cards; or • Something the individual is such as fingerprints, iris scans, or other biometric characteristics.

CIP-005-6 Table R2 –Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	Have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods used to determine active vendor remote access (including Interactive Remote Access and system-to-system remote access), such as: • Methods for accessing logged or monitoring information to determine active vendor remote access sessions; • Methods for monitoring activity (e.g. connection tables or rule hit counters in a firewall, or user activity monitoring) or open ports (e.g. netstat or related commands to display currently active ports) to determine active system to system remote access sessions; or • Methods that control vendor initiation of remote access such as vendors calling and requesting a second factor in order to initiate remote access.

CIP-005-6 Table R2 –Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.5	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	Have one or more method(s) to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods(s) used to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access), such as: • Methods to disable vendor remote access at the applicable Electronic Access Point for system-to-system remote access; or • Methods to disable vendor Interactive Remote Access at the applicable Intermediate System.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.			The Responsible Entity did not have a method for detecting malicious communications for both inbound and outbound communications. (1.5)	The Responsible Entity did not document one or more processes for *CIP-005-6 Table R1 – Electronic Security Perimeter*. (R1) OR The Responsible Entity did not have all applicable Cyber Assets connected to a network via a routable protocol within a defined Electronic Security Perimeter (ESP). (1.1) OR External Routable Connectivity through the ESP was not through an identified EAP. (1.2) OR The Responsible Entity did not require inbound and outbound access permissions and deny all other access by default. (1.3)

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				OR The Responsible Entity did not perform authentication when establishing dial-up connectivity with the applicable Cyber Assets, where technically feasible. (1.4)
R2.	The Responsible Entity does not have documented processes for one or more of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for one of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for two of the applicable items for Requirement Parts 2.1 through 2.3;~~.~~ OR The Responsible Entity did not have either: one or more method(s) for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) (2.4); or one or more methods to disable active vendor remote access (including Interactive	The Responsible Entity did not implement processes for three of the applicable items for Requirement Parts 2.1 through 2.3; OR The Responsible Entity did not have one or more method(s) for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) (2.4) and one or more methods to disable active vendor remote access (including Interactive

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	Update
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-005-5.	
6	tbd	Modified to address certain directives in FERC Order No. 829.	Revised

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. Furthermore,

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

CIP-005-6, Requirement R1 requires segmenting of BES Cyber Systems from other systems of differing trust levels by requiring controlled Electronic Access Points between the different trust zones. Electronic Security Perimeters are also used as a primary defense layer for some BES Cyber Systems that may not inherently have sufficient cyber security functionality, such as devices that lack authentication capability.

All applicable BES Cyber Systems that are connected to a network via a routable protocol must have a defined Electronic Security Perimeter (ESP). Even standalone networks that have no external connectivity to other networks must have a defined ESP. The ESP defines a zone of protection around the BES Cyber System, and it also provides clarity for entities to determine what systems or Cyber Assets are in scope and what requirements they must meet. The ESP is used in:

- Defining the scope of 'Associated Protected Cyber Assets' that must also meet certain CIP requirements.
- Defining the boundary in which all of the Cyber Assets must meet the requirements of the highest impact BES Cyber System that is in the zone (the 'high water mark').

The CIP Cyber Security Standards do not require network segmentation of BES Cyber Systems by impact classification. Many different impact classifications can be mixed within an ESP.

However, all of the Cyber Assets and BES Cyber Systems within the ESP must be protected at the level of the highest impact BES Cyber System present in the ESP (i.e., the "high water mark") where the term "Protected Cyber Assets" is used. The CIP Cyber Security Standards accomplish the "high water mark" by associating all other Cyber Assets within the ESP, even other BES Cyber Systems of lesser impact, as "Protected Cyber Assets" of the highest impact system in the ESP.

For example, if an ESP contains both a high impact BES Cyber System and a low impact BES Cyber System, each Cyber Asset of the low impact BES Cyber System is an "Associated Protected Cyber Asset" of the high impact BES Cyber System and must meet all requirements with that designation in the applicability columns of the requirement tables.

If there is routable connectivity across the ESP into any Cyber Asset, then an Electronic Access Point (EAP) must control traffic into and out of the ESP. Responsible Entities should know what traffic needs to cross an EAP and document those reasons to ensure the EAPs limit the traffic to only those known communication needs. These include, but are not limited to, communications needed for normal operations, emergency operations, support, maintenance, and troubleshooting.

The EAP should control both inbound and outbound traffic. The standard added outbound traffic control, as it is a prime indicator of compromise and a first level of defense against zero day vulnerability-based attacks. If Cyber Assets within the ESP become compromised and attempt to communicate to unknown hosts outside the ESP (usually 'command and control' hosts on the Internet, or compromised 'jump hosts' within the Responsible Entity's other networks acting as intermediaries), the EAPs should function as a first level of defense in stopping the exploit. This does not limit the Responsible Entity from controlling outbound traffic at the level of granularity that it deems appropriate, and large ranges of internal addresses may be allowed. The SDT's intent is that the Responsible Entity knows what other Cyber Assets or ranges of addresses a BES Cyber System needs to communicate with and limits the communications to that known range. For example, most BES Cyber Systems within a Responsible Entity should not have the ability to communicate through an EAP to any network address in the world, but should probably be at least limited to the address space of the Responsible Entity, and preferably to individual subnet ranges or individual hosts within the Responsible Entity's address space. The SDT's intent is not for Responsible Entities to document the inner workings of stateful firewalls, where connections initiated in one direction are allowed a return path. The intent is to know and document what systems can talk to what other systems or ranges of systems on the other side of the EAP, such that rogue connections can be detected and blocked.

This requirement applies only to communications for which access lists and 'deny by default' type requirements can be universally applied, which today are those that employ routable protocols. Direct serial, non-routable connections are not included as there is no perimeter or firewall type security that should be universally mandated across all entities and all serial communication situations. There is no firewall or perimeter capability for an RS232 cable run

between two Cyber Assets. Without a clear 'perimeter type' security control that can be applied in practically every circumstance, such a requirement would mostly generate technical feasibility exceptions ("TFEs") rather than increased security.

As for dial-up connectivity, the Standard Drafting Team's intent of this requirement is to prevent situations where only a phone number can establish direct connectivity to the BES Cyber Asset. If a dial-up modem is implemented in such a way that it simply answers the phone and connects the line to the BES Cyber Asset with no authentication of the calling party, it is a vulnerability to the BES Cyber System. The requirement calls for some form of authentication of the calling party before completing the connection to the BES Cyber System. Some examples of acceptable methods include dial-back modems, modems that must be remotely enabled or powered up, and modems that are only powered on by onsite personnel when needed along with policy that states they are disabled after use. If the dial-up connectivity is used for Interactive Remote Access, then Requirement R2 also applies.

The standard adds a requirement to detect malicious communications for Control Centers. This is in response to FERC Order No. 706, Paragraphs 496-503, where ESPs are required to have two distinct security measures such that the BES Cyber Systems do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear that this is not simply redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs. Technologies meeting this requirement include Intrusion Detection or Intrusion Prevention Systems (IDS/IPS) or other forms of deep packet inspection. These technologies go beyond source/destination/port rule sets and thus provide another distinct security measure at the ESP.

Requirement R2:

See Secure Remote Access Reference Document (see remote access alert).

Rationale

During the development of this standard, references to prior versions of the CIP standards and rationale for the requirements and their parts were embedded within the standard. Upon BOT approval, that information was moved to this section.

Rationale for R1:
The Electronic Security Perimeter ("ESP") serves to control traffic at the external electronic boundary of the BES Cyber System. It provides a first layer of defense for network based attacks as it limits reconnaissance of targets, restricts and prohibits traffic to a specified rule set, and assists in containing any successful attacks.

Summary of Changes: CIP-005, Requirement R1 has taken more of a focus on the discrete Electronic Access Points, rather than the logical "perimeter."

CIP-005 (V1 through V4), Requirement R1.2 has been deleted from V5. This requirement was definitional in nature and used to bring dial-up modems using non-routable protocols into the scope of CIP-005. The non-routable protocol exclusion no longer exists as a blanket CIP-002 filter for applicability in V5, therefore there is no need for this requirement.

CIP-005 (V1 through V4), Requirement R1.1 and R1.3 were also definitional in nature and have been deleted from V5 as separate requirements but the concepts were integrated into the definitions of ESP and Electronic Access Point ("EAP").

Reference to prior version: (Part 1.1) CIP-005-4, R1

Change Rationale: (Part 1.1)
Explicitly clarifies that BES Cyber Assets connected via routable protocol must be in an Electronic Security Perimeter.

Reference to prior version: (Part 1.2) CIP-005-4, R1

Change Rationale: (Part 1.2)
Changed to refer to the defined term Electronic Access Point and BES Cyber System.

Reference to prior version: (Part 1.3) CIP-005-4, R2.1

Change Rationale: (Part 1.3)
Changed to refer to the defined term Electronic Access Point and to focus on the entity knowing and having a reason for what it allows through the EAP in both inbound and outbound directions.

Reference to prior version: (Part 1.4) CIP-005-4, R2.3

Change Rationale: (Part 1.4)
Added clarification that dial-up connectivity should perform authentication so that the BES Cyber System is not directly accessible with a phone number only.

Reference to prior version: (Part 1.5) CIP-005-4, R1

Change Rationale: (Part 1.5)
Per FERC Order No. 706, Paragraphs 496-503, ESPs need two distinct security measures such that the Cyber Assets do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear this is not simple redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs.

Rationale for R2:
Registered Entities use Interactive Remote Access to access Cyber Assets to support and maintain control systems networks. Discovery and announcement of vulnerabilities for remote access methods and technologies, that were previously thought secure and in use by a number of electric sector entities, necessitate changes to industry security control standards. Currently, no requirements are in effect for management of secure remote access to Cyber Assets to be afforded the NERC CIP protective measures. Inadequate safeguards for remote access can allow unauthorized access to the organization's network, with potentially serious consequences. Additional information is provided in ***Guidance for Secure Interactive Remote Access*** published by NERC in July 2011.

Remote access control procedures must provide adequate safeguards through robust identification, authentication and encryption techniques. Remote access to the organization's network and resources will only be permitted providing that authorized users are authenticated, data is encrypted across the network, and privileges are restricted.

The Intermediate System serves as a proxy for the remote user. Rather than allowing all the protocols the user might need to access Cyber Assets inside the Electronic Security Perimeter to traverse from the Electronic Security Perimeter to the remote computer, only the protocol required for remotely controlling the jump host is required. This allows the firewall rules to be much more restrictive than if the remote computer was allowed to connect to Cyber Assets within the Electronic Security Perimeter directly. The use of an Intermediate System also protects the Cyber Asset from vulnerabilities on the remote computer.

The use of multi-factor authentication provides an added layer of security. Passwords can be guessed, stolen, hijacked, found, or given away. They are subject to automated attacks including brute force attacks, in which possible passwords are tried until the password is found, or dictionary attacks, where words and word combinations are tested as possible passwords. But if a password or PIN must be supplied along with a one-time password supplied by a token, a fingerprint, or some other factor, the password is of no value unless the other factor(s) used for authentication are acquired along with it.

Encryption is used to protect the data that is sent between the remote computer and the Intermediate System. Data encryption is important for anyone who wants or needs secure data transfer. Encryption is needed when there is a risk of unauthorized interception of transmissions on the communications link. This is especially important when using the Internet as the communication means.

Summary of Changes: This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.1) New

Change Rationale: (Part 2.1)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.2) CIP-007-5, R3.1

Change Rationale: (Part 2.2)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The purpose of this part is to protect the confidentiality and integrity of each Interactive Remote Access session.

Reference to prior version: (Part 2.3) CIP-007-5, R3.2

Change Rationale: (Part 2.3)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The multi-factor authentication methods are also the same as those identified in the Homeland Security Presidential Directive 12 (HSPD-12), issued August 12, 2007.

A. Introduction

1. **Title:** Cyber Security — Electronic Security Perimeter(s)

2. **Number:** CIP-005-~~5~~6

3. **Purpose:** To manage electronic access to BES Cyber Systems by specifying a controlled Electronic Security Perimeter in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each ~~Special Protection System or~~ Remedial Action Scheme where the ~~Special Protection System or~~ Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each ~~Special Protection System or~~ Remedial Action Scheme where the ~~Special Protection System or~~ Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers: All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-005-~~5~~6:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes.

5. Effective Dates: See Implementation Plan for Project 2016-03

6. Background: Standard CIP-005-~~5~~ exists as part of a suite of CIP Standards related to cyber security which require the initial identification and categorization of BES Cyber Systems and require organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.~~ CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1 require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, ~~etc~~etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables: Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5 identification and categorization processes.
- **High Impact BES Cyber Systems with Dial-up Connectivity** – Only applies to high impact BES Cyber Systems with Dial-up Connectivity.

- **High Impact BES Cyber Systems with External Routable Connectivity** – Only applies to high impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Medium Impact BES Cyber Systems** – Applies to each BES Cyber Systems categorized as medium impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.
- **Medium Impact BES Cyber Systems with Dial-up Connectivity** – Only applies to medium impact BES Cyber Systems with Dial-up Connectivity.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Electronic Access Points (EAP)** – Applies at Electronic Access Points associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-005-~~5~~ 6 Table R1 – Electronic Security Perimeter*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-005-~~5~~ 6 Table R1 – Electronic Security Perimeter* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-~~5~~ 6 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP.	An example of evidence may include, but is not limited to, a list of all ESPs with all uniquely identifiable applicable Cyber Assets connected via a routable protocol within each ESP.
1.2	High Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	All External Routable Connectivity must be through an identified Electronic Access Point (EAP).	An example of evidence may include, but is not limited to, network diagrams showing all external routable communication paths and the identified EAPs.

CIP-005-~~5~~ 6 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	Electronic Access Points for High Impact BES Cyber Systems Electronic Access Points for Medium Impact BES Cyber Systems	Require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default.	An example of evidence may include, but is not limited to, a list of rules (firewall, access control lists, etc.) that demonstrate that only permitted access is allowed and that each access rule has a documented reason.
1.4	High Impact BES Cyber Systems with Dial-up Connectivity and their associated: • PCA Medium Impact BES Cyber Systems with Dial-up Connectivity and their associated: • PCA	Where technically feasible, perform authentication when establishing Dial-up Connectivity with applicable Cyber Assets.	An example of evidence may include, but is not limited to, a documented process that describes how the Responsible Entity is providing authenticated access through each dial-up connection.

CIP-005-~~5~~ 6 Table R1 – Electronic Security Perimeter			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	Electronic Access Points for High Impact BES Cyber Systems Electronic Access Points for Medium Impact BES Cyber Systems at Control Centers	Have one or more methods for detecting known or suspected malicious communications for both inbound and outbound communications.	An example of evidence may include, but is not limited to, documentation that malicious communications detection methods (e.g. intrusion detection system, application layer firewall, etc.) are implemented.

Rationale for Requirement R2:
Proposed Requirement R2 Parts 2.4 and 2.5 addresses Order No. 829 directives for controls on vendor-initiated remote access to BES Cyber Systems covering both user-initiated and machine-to-machine vendor remote access (P. 51). The objective is to mitigate potential risks of a compromise at a vendor during an active remote access session with a Responsible Entity from impacting the BES.

The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. This scope covers all remote access sessions with vendors. The obligation in Part 2.4 requires entities to have a method to determine active vendor remote access sessions. While not required, a solution that identifies all active remote access sessions, regardless of whether they originate from a vendor, would meet the intent of this requirement. The objective of Requirement R2 Part 2.5 is for entities to have the ability to disable active remote access sessions in the event of a system breach as specified in Order No. 829 (P. 52).

The scope of Requirement R2 in CIP-005-6 is expanded from approved CIP-005-5 to address all remote access management, not just Interactive Remote Access. If a Responsible Entity does not allow remote access (system-to-system or Interactive Remote Access) then the Responsible Entity need not develop a process for each of the subparts in Requirement R2. The entity could document that it does not allow remote access to meet the reliability objective.

The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contracts with to supply BES Cyber Systems and related services. It does not include other

NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

R2. Each Responsible Entity ~~allowing Interactive Remote Access to BES Cyber Systems~~ shall implement one or more documented processes that collectively include the applicable requirement parts, where technically feasible, in *CIP-005-~~5~~ 6 Table R2 – ~~Interactive~~ Remote Access Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M2. Evidence must include the documented processes that collectively address each of the applicable requirement parts in *CIP-005-~~5~~ 6 Table R2 – ~~Interactive~~ Remote Access Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-~~5~~ 6 Table R2 – ~~Interactive~~ Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	For all Interactive Remote Access, ~~U~~utilize an Intermediate System such that the Cyber Asset initiating Interactive Remote Access does not directly access an applicable Cyber Asset.	Examples of evidence may include, but are not limited to, network diagrams or architecture documents.
2.2	High Impact BES Cyber Systems and their associated: • PCA	For all Interactive Remote Access sessions, utilize encryption that terminates at an Intermediate System.	An example of evidence may include, but is not limited to, architecture documents detailing where encryption initiates and terminates.

CIP-005-~~5~~ 6 Table R2 – ~~Interactive~~ Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
	Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA		
2.3	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	Require multi-factor authentication for all Interactive Remote Access sessions.	An example of evidence may include, but is not limited to, architecture documents detailing the authentication factors used. Examples of authenticators may include, but are not limited to, • Something the individual knows such as passwords or PINs. This does not include User ID; • Something the individual has such as tokens, digital certificates, or smart cards; or • Something the individual is such as fingerprints, iris scans, or other biometric characteristics.

CIP-005-~~5~~ 6 Table R2 – ~~Interactive~~ Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	• Have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods used to determine active vendor remote access (including Interactive Remote Access and system-to-system remote access), such as: • Methods for accessing logged or monitoring information to determine active vendor remote access sessions; • Methods for monitoring activity (e.g. connection tables or rule hit counters in a firewall, or user activity monitoring) or open ports (e.g. netstat or related commands to display currently active ports) to determine active system to system remote access sessions; or • Methods that control vendor initiation of remote access such as vendors calling and requesting a second factor in order to initiate remote access. •

CIP-005-~~5~~ 6 Table R2 – ~~Interactive~~ Remote Access Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.5	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: • PCA	Have one or more method(s) to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access).	Examples of evidence may include, but are not limited to, documentation of the methods(s) used to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access), such as: • Methods to disable vendor remote access at the applicable Electronic Access Point for system-to-system remote access; or • Methods to disable vendor Interactive Remote Access at the applicable Intermediate System.

C. Compliance

1. **Compliance Monitoring Process:**

   1.1. Compliance Enforcement Authority: The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

   1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit

   The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

   - Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
   - If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
   - The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

   1.3. Compliance Monitoring and Assessment Processes:

   - Compliance Audit
   - Self-Certification
   - Spot Checking
   - Compliance Investigation
   - Self-Reporting
   - Complaint

   1.4. Additional Compliance Information:

   None.

Violation Severity Levels

R #	Time Horizon	VRF	Violation Severity Levels (CIP-005-~~5~~ 6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	**Operations Planning and Same Day Operations**	**Medium**			The Responsible Entity did not have a method for detecting malicious communications for both inbound and outbound communications. (1.5)	The Responsible Entity did not document one or more processes for *CIP-005-~~5~~ 6 Table R1 – Electronic Security Perimeter*. (R1) OR The Responsible Entity did not have all applicable Cyber Assets connected to a network via a routable protocol within a defined Electronic Security Perimeter (ESP). (1.1) OR External Routable Connectivity through the ESP was not through an identified EAP. (1.2) OR

R #	Time Horizon	VRF	Violation Severity Levels (CIP-005-~~5~~-6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						The Responsible Entity did not require inbound and outbound access permissions and deny all other access by default. (1.3) OR The Responsible Entity did not perform authentication when establishing dial-up connectivity with the applicable Cyber Assets, where technically feasible. (1.4)
R2.	**Operations Planning and Same Day Operations**	**Medium**	The Responsible Entity does not have documented processes for one or more of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for one of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for two of the applicable items for Requirement Parts 2.1 through 2.3~~;~~ OR	The Responsible Entity did not implement processes for three of the applicable items for Requirement Parts 2.1 through 2.3~~;~~ OR

R #	Time Horizon	VRF	Violation Severity Levels (CIP-005-~~5~~-6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
					The Responsible Entity did not have either: one or more method(s) for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) (2.4); or one or more methods to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access) (2.5).	The Responsible Entity did not have one or more method(s) for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) (2.4) and one or more methods to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access) (2.5).

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	12/30/10	Modified to add specific criteria for Critical Asset identification.	Update
4	1/24/11	Approved by the NERC Board of Trustees.	Update
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-005-5.	

6	tbd	Modified to address certain directives in FERC Order No. 829.	Revised

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. Furthermore,

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

CIP-005-5-6, Requirement R1 requires segmenting of BES Cyber Systems from other systems of differing trust levels by requiring controlled Electronic Access Points between the different trust zones. Electronic Security Perimeters are also used as a primary defense layer for some BES Cyber Systems that may not inherently have sufficient cyber security functionality, such as devices that lack authentication capability.

All applicable BES Cyber Systems that are connected to a network via a routable protocol must have a defined Electronic Security Perimeter (ESP). Even standalone networks that have no external connectivity to other networks must have a defined ESP. The ESP defines a zone of protection around the BES Cyber System, and it also provides clarity for entities to determine what systems or Cyber Assets are in scope and what requirements they must meet. The ESP is used in:

- Defining the scope of 'Associated Protected Cyber Assets' that must also meet certain CIP requirements.
- Defining the boundary in which all of the Cyber Assets must meet the requirements of the highest impact BES Cyber System that is in the zone (the 'high water mark').

The CIP Cyber Security Standards do not require network segmentation of BES Cyber Systems by impact classification. Many different impact classifications can be mixed within an ESP.

However, all of the Cyber Assets and BES Cyber Systems within the ESP must be protected at the level of the highest impact BES Cyber System present in the ESP (i.e., the "high water mark") where the term "Protected Cyber Assets" is used. The CIP Cyber Security Standards accomplish the "high water mark" by associating all other Cyber Assets within the ESP, even other BES Cyber Systems of lesser impact, as "Protected Cyber Assets" of the highest impact system in the ESP.

For example, if an ESP contains both a high impact BES Cyber System and a low impact BES Cyber System, each Cyber Asset of the low impact BES Cyber System is an "Associated Protected Cyber Asset" of the high impact BES Cyber System and must meet all requirements with that designation in the applicability columns of the requirement tables.

If there is routable connectivity across the ESP into any Cyber Asset, then an Electronic Access Point (EAP) must control traffic into and out of the ESP. Responsible Entities should know what traffic needs to cross an EAP and document those reasons to ensure the EAPs limit the traffic to only those known communication needs. These include, but are not limited to, communications needed for normal operations, emergency operations, support, maintenance, and troubleshooting.

The EAP should control both inbound and outbound traffic. The standard added outbound traffic control, as it is a prime indicator of compromise and a first level of defense against zero day vulnerability-based attacks. If Cyber Assets within the ESP become compromised and attempt to communicate to unknown hosts outside the ESP (usually 'command and control' hosts on the Internet, or compromised 'jump hosts' within the Responsible Entity's other networks acting as intermediaries), the EAPs should function as a first level of defense in stopping the exploit. This does not limit the Responsible Entity from controlling outbound traffic at the level of granularity that it deems appropriate, and large ranges of internal addresses may be allowed. The SDT's intent is that the Responsible Entity knows what other Cyber Assets or ranges of addresses a BES Cyber System needs to communicate with and limits the communications to that known range. For example, most BES Cyber Systems within a Responsible Entity should not have the ability to communicate through an EAP to any network address in the world, but should probably be at least limited to the address space of the Responsible Entity, and preferably to individual subnet ranges or individual hosts within the Responsible Entity's address space. The SDT's intent is not for Responsible Entities to document the inner workings of stateful firewalls, where connections initiated in one direction are allowed a return path. The intent is to know and document what systems can talk to what other systems or ranges of systems on the other side of the EAP, such that rogue connections can be detected and blocked.

This requirement applies only to communications for which access lists and 'deny by default' type requirements can be universally applied, which today are those that employ routable protocols. Direct serial, non-routable connections are not included as there is no perimeter or firewall type security that should be universally mandated across all entities and all serial communication situations. There is no firewall or perimeter capability for an RS232 cable run

between two Cyber Assets. Without a clear 'perimeter type' security control that can be applied in practically every circumstance, such a requirement would mostly generate technical feasibility exceptions ("TFEs") rather than increased security.

As for dial-up connectivity, the Standard Drafting Team's intent of this requirement is to prevent situations where only a phone number can establish direct connectivity to the BES Cyber Asset. If a dial-up modem is implemented in such a way that it simply answers the phone and connects the line to the BES Cyber Asset with no authentication of the calling party, it is a vulnerability to the BES Cyber System. The requirement calls for some form of authentication of the calling party before completing the connection to the BES Cyber System. Some examples of acceptable methods include dial-back modems, modems that must be remotely enabled or powered up, and modems that are only powered on by onsite personnel when needed along with policy that states they are disabled after use. If the dial-up connectivity is used for Interactive Remote Access, then Requirement R2 also applies.

The standard adds a requirement to detect malicious communications for Control Centers. This is in response to FERC Order No. 706, Paragraphs 496-503, where ESPs are required to have two distinct security measures such that the BES Cyber Systems do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear that this is not simply redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs. Technologies meeting this requirement include Intrusion Detection or Intrusion Prevention Systems (IDS/IPS) or other forms of deep packet inspection. These technologies go beyond source/destination/port rule sets and thus provide another distinct security measure at the ESP.

Requirement R2:

See Secure Remote Access Reference Document (see remote access alert).

Rationale

During the development of this standard, references to prior versions of the CIP standards and rationale for the requirements and their parts were embedded within the standard. Upon BOT approval, that information was moved to this section.

Rationale for R1:
The Electronic Security Perimeter ("ESP") serves to control traffic at the external electronic boundary of the BES Cyber System. It provides a first layer of defense for network based attacks as it limits reconnaissance of targets, restricts and prohibits traffic to a specified rule set, and assists in containing any successful attacks.

Summary of Changes: CIP-005, Requirement R1 has taken more of a focus on the discrete Electronic Access Points, rather than the logical "perimeter."

CIP-005 (V1 through V4), Requirement R1.2 has been deleted from V5. This requirement was definitional in nature and used to bring dial-up modems using non-routable protocols into the scope of CIP-005. The non-routable protocol exclusion no longer exists as a blanket CIP-002 filter for applicability in V5, therefore there is no need for this requirement.

CIP-005 (V1 through V4), Requirement R1.1 and R1.3 were also definitional in nature and have been deleted from V5 as separate requirements but the concepts were integrated into the definitions of ESP and Electronic Access Point ("EAP").

Reference to prior version: (Part 1.1) CIP-005-4, R1

Change Rationale: (Part 1.1)
Explicitly clarifies that BES Cyber Assets connected via routable protocol must be in an Electronic Security Perimeter.

Reference to prior version: (Part 1.2) CIP-005-4, R1

Change Rationale: (Part 1.2)
Changed to refer to the defined term Electronic Access Point and BES Cyber System.

Reference to prior version: (Part 1.3) CIP-005-4, R2.1

Change Rationale: (Part 1.3)
Changed to refer to the defined term Electronic Access Point and to focus on the entity knowing and having a reason for what it allows through the EAP in both inbound and outbound directions.

Reference to prior version: (Part 1.4) CIP-005-4, R2.3

Change Rationale: (Part 1.4)
Added clarification that dial-up connectivity should perform authentication so that the BES Cyber System is not directly accessible with a phone number only.

Reference to prior version: (Part 1.5) CIP-005-4, R1

Change Rationale: (Part 1.5)
Per FERC Order No. 706, Paragraphs 496-503, ESPs need two distinct security measures such that the Cyber Assets do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear this is not simple redundancy of firewalls, thus the SDT has decided to add the security measure of malicious traffic inspection as a requirement for these ESPs.

Rationale for R2:
Registered Entities use Interactive Remote Access to access Cyber Assets to support and maintain control systems networks. Discovery and announcement of vulnerabilities for remote access methods and technologies, that were previously thought secure and in use by a number of electric sector entities, necessitate changes to industry security control standards. Currently, no requirements are in effect for management of secure remote access to Cyber Assets to be afforded the NERC CIP protective measures. Inadequate safeguards for remote access can allow unauthorized access to the organization's network, with potentially serious consequences. Additional information is provided in ***Guidance for Secure Interactive Remote Access*** published by NERC in July 2011.

Remote access control procedures must provide adequate safeguards through robust identification, authentication and encryption techniques. Remote access to the organization's network and resources will only be permitted providing that authorized users are authenticated, data is encrypted across the network, and privileges are restricted.

The Intermediate System serves as a proxy for the remote user. Rather than allowing all the protocols the user might need to access Cyber Assets inside the Electronic Security Perimeter to traverse from the Electronic Security Perimeter to the remote computer, only the protocol required for remotely controlling the jump host is required. This allows the firewall rules to be much more restrictive than if the remote computer was allowed to connect to Cyber Assets within the Electronic Security Perimeter directly. The use of an Intermediate System also protects the Cyber Asset from vulnerabilities on the remote computer.

The use of multi-factor authentication provides an added layer of security. Passwords can be guessed, stolen, hijacked, found, or given away. They are subject to automated attacks including brute force attacks, in which possible passwords are tried until the password is found, or dictionary attacks, where words and word combinations are tested as possible passwords. But if a password or PIN must be supplied along with a one-time password supplied by a token, a fingerprint, or some other factor, the password is of no value unless the other factor(s) used for authentication are acquired along with it.

Encryption is used to protect the data that is sent between the remote computer and the Intermediate System. Data encryption is important for anyone who wants or needs secure data transfer. Encryption is needed when there is a risk of unauthorized interception of transmissions on the communications link. This is especially important when using the Internet as the communication means.

Summary of Changes: This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.1) New

Change Rationale: (Part 2.1)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Reference to prior version: (Part 2.2) CIP-007-5, R3.1

Change Rationale: (Part 2.2)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The purpose of this part is to protect the confidentiality and integrity of each Interactive Remote Access session.

Reference to prior version: (Part 2.3) CIP-007-5, R3.2

Change Rationale: (Part 2.3)
This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3. The multi-factor authentication methods are also the same as those identified in the Homeland Security Presidential Directive 12 (HSPD-12), issued August 12, 2007.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	October 19, 2016
SAR posted for comment	October 20 - November 21, 2016
45-day formal comment period with ballot	May 2 – June 15, 2017

Anticipated Actions	Date
10-day final ballot	July 2017
NERC Board (Board) adoption	August 2017

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None

Upon Board adoption, the rationale boxes will be moved to the Supplemental Material Section.

A. Introduction

1. **Title:** Cyber Security — Configuration Change Management and Vulnerability Assessments

2. **Number:** CIP-010-3

3. **Purpose:** To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly. For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-010-3:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes.

5. Effective Date:

See Implementation Plan for Project 2016-03.

6. Background: Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the

standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples

may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:
Proposed requirement R1 Part 1.6 addresses directives in Order No. 829 for verifying software integrity and authenticity prior to installation in BES Cyber Systems (P. 48).

The objective of verifying software integrity and authenticity is to ensure that the software being installed in the BES Cyber System was not modified without the awareness of the software supplier and is not counterfeit.

Guidance and examples are provided in the Guidelines and Technical Basis Section of this standard.

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-3 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-3 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.6	High Impact BES Cyber Systems Medium Impact BES Cyber Systems Note: Implementation does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Part 1.6: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.	Prior to a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5, and when the method to do so is available to the Responsible Entity from the software source: 1.6.1. Verify the identity of the software source; and 1.6.2. Verify the integrity of the software obtained from the software source.	An example of evidence may include, but is not limited to a change request record that demonstrates the verification of identity of the software source and integrity of the software was performed prior to the baseline change or a process which documents the mechanisms in place that would automatically ensure the identity of the software source and integrity of the software.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-3 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-3 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-3 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-3 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-3 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

R4. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems and associated Protected Cyber Assets, shall implement, except under CIP Exceptional Circumstances, one or more documented plan(s) for Transient Cyber Assets

and Removable Media that include the sections in Attachment 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence shall include each of the documented plan(s) for Transient Cyber Assets and Removable Media that collectively include each of the applicable sections in Attachment 1 and additional evidence to demonstrate implementation of plan(s) for Transient Cyber Assets and Removable Media. Additional examples of evidence per section are located in Attachment 2. If a Responsible Entity does not use Transient Cyber Asset(s) or Removable Media, examples of evidence include, but are not limited to, a statement, policy, or other document that states the Responsible Entity does not use Transient Cyber Asset(s) or Removable Media.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only four of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only three of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only two of the required baseline items listed in 1.1.1 through 1.1.5. (1.1) OR The Responsible Entity has a process as specified in Part 1.6 to verify the identity of the software source (1.6.1) but does not have a process as specified in Part 1.6 to verify the integrity of the software provided by the software source when the method to do so is available to the Responsible Entity from the software source. (1.6.2)	The Responsible Entity has not documented or implemented any configuration change management process(es). (R1) OR The Responsible Entity has documented and implemented a configuration change management process(es) that includes only one of the required baseline items listed in 1.1.1 through 1.1.5. (1.1) OR The Responsible Entity does not have a process(es) that requires authorization and documentation of changes that deviate from the existing baseline configuration. (1.2)

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				OR The Responsible Entity does not have a process(es) to update baseline configurations within 30 calendar days of completing a change(s) that deviates from the existing baseline configuration.(1.3) OR The Responsible Entity does not have a process(es) to determine required security controls in CIP-005 and CIP-007 that could be impacted by a change(s) that deviates from the existing baseline configuration. (1.4.1) OR The Responsible Entity has a process(es) to determine required security controls in CIP-005 and CIP-007 that could be impacted by a change(s) that deviates from the existing baseline

R #	Violation Severity Levels

Required Sections for Plans for Transient Cyber Assets and Removable Media

Responsible Entities shall include each of the sections provided below in their plan(s) for Transient Cyber Assets and Removable Media as required under Requirement R4.

Section 1. Transient Cyber Asset(s) Managed by the Responsible Entity.

1.1. Transient Cyber Asset Management: Responsible Entities shall manage Transient Cyber Asset(s), individually or by group: (1) in an ongoing manner to ensure compliance with applicable requirements at all times, (2) in an on-demand manner applying the applicable requirements before connection to a BES Cyber System, or (3) a combination of both (1) and (2) above.

1.2. Transient Cyber Asset Authorization: For each individual or group of Transient Cyber Asset(s), each Responsible Entity shall authorize:

1.2.1. Users, either individually or by group or role;

1.2.2. Locations, either individually or by group; and

1.2.3. Uses, which shall be limited to what is necessary to perform business functions.

1.3. Software Vulnerability Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of vulnerabilities posed by unpatched software on the Transient Cyber Asset (per Transient Cyber Asset capability):

- Security patching, including manual or managed updates;
- Live operating system and software executable only from read-only media;
- System hardening; or
- Other method(s) to mitigate software vulnerabilities.

1.4. Introduction of Malicious Code Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the introduction of malicious code (per Transient Cyber Asset capability):

- Antivirus software, including manual or managed updates of signatures or patterns;
- Application whitelisting; or
- Other method(s) to mitigate the introduction of malicious code.

1.5. Unauthorized Use Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of unauthorized use of Transient Cyber Asset(s):

- Restrict physical access;
- Full-disk encryption with authentication;
- Multi-factor authentication; or
- Other method(s) to mitigate the risk of unauthorized use.

Section 2. Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity.

2.1 Software Vulnerabilities Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of vulnerabilities posed by unpatched software on the Transient Cyber Asset (per Transient Cyber Asset capability):

- Review of installed security patch(es);
- Review of security patching process used by the party;
- Review of other vulnerability mitigation performed by the party; or
- Other method(s) to mitigate software vulnerabilities.

2.2 Introduction of malicious code mitigation: Use one or a combination of the following methods to achieve the objective of mitigating malicious code (per Transient Cyber Asset capability):

- Review of antivirus update level;
- Review of antivirus update process used by the party;
- Review of application whitelisting used by the party;
- Review use of live operating system and software executable only from read-only media;
- Review of system hardening used by the party; or
- Other method(s) to mitigate malicious code.

2.3 For any method used to mitigate software vulnerabilities or malicious code as specified in 2.1 and 2.2, Responsible Entities shall determine whether any additional mitigation actions are necessary and implement such actions prior to connecting the Transient Cyber Asset.

Section 3. Removable Media

3.1. Removable Media Authorization: For each individual or group of Removable Media, each Responsible Entity shall authorize:

3.1.1. Users, either individually or by group or role; and

3.1.2. Locations, either individually or by group.

3.2. Malicious Code Mitigation: To achieve the objective of mitigating the threat of introducing malicious code to high impact or medium impact BES Cyber Systems and their associated Protected Cyber Assets, each Responsible Entity shall:

3.2.1. Use method(s) to detect malicious code on Removable Media using a Cyber Asset other than a BES Cyber System or Protected Cyber Assets; and

3.2.2. Mitigate the threat of detected malicious code on Removable Media prior to connecting the Removable Media to a high impact or medium impact BES Cyber System or associated Protected Cyber Assets.

CIP-010-3 - Attachment 2

Examples of Evidence for Plans for Transient Cyber Assets and Removable Media

Section 1.1: Examples of evidence for Section 1.1 may include, but are not limited to, the method(s) of management for the Transient Cyber Asset(s). This can be included as part of the Transient Cyber Asset plan(s), part of the documentation related to authorization of Transient Cyber Asset(s) managed by the Responsible Entity or part of a security policy.

Section 1.2: Examples of evidence for Section 1.2 may include, but are not limited to, documentation from asset management systems, human resource management systems, or forms or spreadsheets that show authorization of Transient Cyber Asset(s) managed by the Responsible Entity. Alternatively, this can be documented in the overarching plan document.

Section 1.3: Examples of evidence for Section 1.3 may include, but are not limited to, documentation of the method(s) used to mitigate software vulnerabilities posed by unpatched software such as security patch management implementation, the use of live operating systems from read-only media, system hardening practices or other method(s) to mitigate the software vulnerability posed by unpatched software. Evidence can be from change management systems, automated patch management solutions, procedures or processes associated with using live operating systems, or procedures or processes associated with system hardening practices. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the vendor or Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 1.4: Examples of evidence for Section 1.4 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 1.5: Examples of evidence for Section 1.5 may include, but are not limited to, documentation through policies or procedures of the method(s) to restrict physical access; method(s) of the full-disk encryption solution along with the authentication protocol; method(s) of the multi-factor authentication solution; or documentation of other method(s) to mitigate the risk of unauthorized use.

Section 2.1: Examples of evidence for Section 2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of installed security patch(es); memoranda, electronic mail, policies or contracts from parties other than the Responsible Entity that identify the security patching process or vulnerability mitigation performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail, system documentation or contracts that identifies acceptance by the Responsible Entity that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate software vulnerabilities for Transient Cyber Asset(s) managed by a party other than the Responsible Entity. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 2.2: Examples of evidence for Section 2.2 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed antivirus update level; memoranda, electronic mail, system documentation, policies or contracts from the party other than the Responsible Entity that identify the antivirus update process, the use of application whitelisting, use of live of operating systems or system hardening performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that identifies the Responsible Entity's acceptance that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate malicious code for Transient Cyber Asset(s) managed by a party other than the Responsible Entity. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 2.3: Examples of evidence for Section 2.3 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigations are necessary and that they have been implemented prior to connecting the Transient Cyber Asset managed by a party other than the Responsible Entity.

Section 3.1: Examples of evidence for Section 3.1 may include, but are not limited to, documentation from asset management systems, human resource management systems, forms or spreadsheets that shows authorization of Removable Media. The documentation must identify Removable Media, individually or by group of Removable Media, along with the authorized users,

either individually or by group or role, and the authorized locations, either individually or by group.

Section 3.2: Examples of evidence for Section 3.2 may include, but are not limited to, documented process(es) of the method(s) used to mitigate malicious code such as results of scan settings for Removable Media, or implementation of on-demand scanning. Documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and that show mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included. Custom software installed may include scripts developed for local entity functions or

other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Software Verification

The concept of software verification (verifying the identity of the software source and the integrity of the software obtained from the software source) is a key control in preventing the introduction of malware or counterfeit software. This objective is intended to reduce the likelihood that an attacker could exploit legitimate vendor patch management processes to deliver compromised software updates or patches to a BES Cyber System. The intent of the SDT is for Responsible Entities to provide controls for verifying the baseline elements that are updated by vendors. It is important to note that this is not limited to only security patches.

NIST SP-800-161 includes a number of security controls, which, when taken together, reduce the probability of a successful "Watering Hole" or similar cyber attack in the industrial control system environment and thus could assist in addressing this objective. For example, in the System and Information Integrity (SI) control family, control SI-7 suggests users obtain software directly from the developer and verify the integrity of the software using controls such as digital signatures. In the Configuration Management (CM) control family, control CM-5(3) requires that the information system prevent the installation of firmware or software without the verification that the component has been digitally signed to ensure that the hardware and software components are genuine and valid. NIST SP-800-161, while not meant to be definitive, provides examples of controls for addressing this objective. Other controls also could meet this objective.

In implementing Requirement R1 Part 1.6, the responsible entity should consider their existing CIP cyber security policies and controls in addition to the following:

- Processes used to deliver software and appropriate control(s) that will verify the identity of the software source and the integrity of the software delivered through these processes. To the extent that the responsible entity utilizes automated systems such as a subscription service to download and distribute software including updates, consider how software verification can be performed through those processes.
- Coordination of the responsible entity's software verification control(s) with other cyber security policies and controls, including change management and patching processes, and procurement controls.
- Use of a secure central software repository after the identity of the software source and the integrity of the software have been validated, so that verifications do not need to be performed repeatedly before each installation.
- Additional controls such as examples outlined in the Software, Firmware, and Information Integrity (SI-7) section of NIST Special Publication 800-53 Revision 4, or similar guidance.
- Additional controls such as those defined in FIPS-140-2, FIPS 180-4, or similar guidance, to ensure the cryptographic methods used are acceptable to the Responsible Entity.

Responsible entities may use various methods to verify the integrity of software obtained from the software source. Examples include, but are not limited to, the following:

- Verify that the software has been digitally signed and validate the signature to ensure that the software's integrity has not been compromised.
- Use public key infrastructure (PKI) with encryption to ensure that the software is not modified in transit by enabling only intended recipients to decrypt the software.
- Require software sources to provide fingerprints or cipher hashes for all software and verify the values prior to installation on a BES Cyber System to ensure the integrity of the software. Consider using a method for receiving the verification values that is different from the method used to receive the software from the software source.
- Use trusted/controlled distribution and delivery options to reduce supply chain risk (e.g., requiring tamper-evident packaging of software during shipping.)

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.
2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.
3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Requirement R4:

Because most BES Cyber Assets and BES Cyber Systems are isolated from external public or untrusted networks, Transient Cyber Assets and Removable Media are a means for cyber-attack. Transient Cyber Assets and Removable Media are often the only way to transport files to and from secure areas to maintain, monitor, or troubleshoot critical systems. To protect the BES Cyber Assets and BES Cyber Systems, entities are required to document and implement a plan for how they will manage the use of Transient Cyber Assets and Removable Media. The

approach of defining a plan allows the Responsible Entity to document the processes that are supportable within its organization and in alignment with its change management processes.

Transient Cyber Assets and Removable Media are those devices connected temporarily to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Transient Cyber Assets and Removable Media do not provide BES reliability services and are not part of the BES Cyber Asset to which they are connected. Examples of these temporarily connected devices include, but are not limited to:

- Diagnostic test equipment;
- Packet sniffers;
- Equipment used for BES Cyber System maintenance;
- Equipment used for BES Cyber System configuration; or
- Equipment used to perform vulnerability assessments.

Transient Cyber Assets can be one of many types of devices from a specially-designed device for maintaining equipment in support of the BES to a platform such as a laptop, desktop, or tablet that may just interface with or run applications that support BES Cyber Systems and is capable of transmitting executable code. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

While the definitions of Transient Cyber Asset and Removable Media include a conditional provision that requires them to be connected for 30 days or less, Section 1.1 of Attachment 1 allows the Responsible Entity to include provisions in its plan(s) that allow continuous or on-demand treatment and application of controls independent of the connected state. Please note that for on-demand treatment, the requirements only apply when Transient Cyber Assets and Removable Media are being connected to a BES Cyber System or Protected Cyber Asset. Once the transient device is disconnected, the requirements listed herein are not applicable until that Transient Cyber Asset or Removable Media is to be reconnected to the BES Cyber Asset or Protected Cyber Asset.

The attachment was created to specify the capabilities and possible security methods available to Responsible Entities based upon asset type, ownership, and management.

With the list of options provided in Attachment 1 for each control area, the entity has the discretion to use the option(s) that is most appropriate. This includes documenting its approach for how and when the entity manages or reviews the Transient Cyber Asset under its control or under the control of parties other than the Responsible Entity. The entity should avoid implementing a security function that jeopardizes reliability by taking actions that would negatively impact the performance or support of the Transient Cyber Asset, BES Cyber Asset, or Protected Cyber Asset.

Vulnerability Mitigation

The terms “mitigate”, “mitigating”, and “mitigation” are used in the sections in Attachment 1 to address the risks posed by malicious code, software vulnerabilities, and unauthorized use when

connecting Transient Cyber Assets and Removable Media. Mitigation in this context does not require that each vulnerability is individually addressed or remediated, as many may be unknown or not have an impact on the system to which the Transient Cyber Asset or Removable Media is connected. Mitigation is meant to reduce security risks presented by connecting the Transient Cyber Asset.

Per Transient Cyber Asset Capability

As with other CIP standards, the requirements are intended for an entity to use the method(s) that the system is capable of performing. The use of "per Transient Cyber Asset capability" is to eliminate the need for a Technical Feasibility Exception when it is understood that the device cannot use a method(s). For example, for malicious code, many types of appliances are not capable of implementing antivirus software; therefore, because it is not a capability of those types of devices, implementation of the antivirus software would not be required for those devices.

Requirement R4, Attachment 1, Section 1 - Transient Cyber Asset(s) Managed by the Responsible Entity

Section 1.1: Entities have a high level of control for the assets that they manage. The requirements listed herein allow entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection or use a combination of these methods. The devices may be managed individually or by group.

Section 1.2: Entities are to document and implement their process(es) to authorize the use of Transient Cyber Assets for which they have direct management. The Transient Cyber Assets may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:

1.2.1 User(s), individually or by group/role, allowed to use the Transient Cyber Asset(s). This can be done by listing a specific person, department, or job function. Caution: consider whether these user(s) must also have authorized electronic access to the applicable system in accordance with CIP-004.

1.2.2 Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group of locations.

1.2.3 The intended or approved use of each individual, type, or group of Transient Cyber Asset. This should also include the software or application packages that are authorized with the purpose of performing defined business functions or tasks (e.g., used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes), and approved network interfaces (e.g., wireless, including near field communication or Bluetooth, and wired connections). Activities, and software or application packages, not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals through the CIP-004 Security Awareness Program and Cyber Security Training Program about authorized and unauthorized activities or uses (e.g.,

using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).

Entities should exercise caution when using Transient Cyber Assets and ensure they do not have features enabled (e.g., wireless or Bluetooth features) in a manner that would allow the device to bridge an outside network to an applicable system. Doing so would cause the Transient Cyber Asset to become an unauthorized Electronic Access Point in violation of CIP-005, Requirement R1.

Attention should be paid to Transient Cyber Assets that may be used for assets in differing impact areas (i.e., high impact, medium impact, and low impact). These impact areas have differing levels of protection under the CIP requirements, and measures should be taken to prevent the introduction of malicious code from a lower impact area. An entity may want to consider the need to have separate Transient Cyber Assets for each impact level.

Section 1.3: Entities are to document and implement their process(es) to mitigate software vulnerabilities posed by unpatched software through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. Recognizing there is a huge diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in software vulnerability management solutions, options are listed that include the alternative for the entity to use a technology or process that effectively mitigates vulnerabilities.

- Security patching, including manual or managed updates provides flexibility to the Responsible Entity to determine how its Transient Cyber Asset(s) will be used. It is possible for an entity to have its Transient Cyber Asset be part of an enterprise patch process and receive security patches on a regular schedule or the entity can verify and apply security patches prior to connecting the Transient Cyber Asset to an applicable Cyber Asset. Unlike CIP-007, Requirement R2, there is no expectation of creating dated mitigation plans or other documentation other than what is necessary to identify that the Transient Cyber Asset is receiving appropriate security patches.
- Live operating system and software executable only from read-only media is provided to allow a protected operating system that cannot be modified to deliver malicious software. When entities are creating custom live operating systems, they should check the image during the build to ensure that there is not malicious software on the image.
- System hardening, also called operating system hardening, helps minimize security vulnerabilities by removing all non-essential software programs and utilities and only installing the bare necessities that the computer needs to function. While other programs may provide useful features, they can provide "back-door" access to the system, and should be removed to harden the system.
- When selecting to use other methods that mitigate software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet the software vulnerability mitigation objective.

Section 1.4: Entities are to document and implement their process(es) to mitigate malicious code through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. As with vulnerability management, there is diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in malicious code protections. When addressing malicious code protection, the Responsible Entity should address methods deployed to deter, detect, or prevent malicious code. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

- Antivirus software, including manual or managed updates of signatures or patterns, provides flexibility just as with security patching, to manage Transient Cyber Asset(s) by deploying antivirus or endpoint security tools that maintain a scheduled update of the signatures or patterns. Also, for devices that do not regularly connect to receive scheduled updates, entities may choose to scan the Transient Cyber Asset prior to connection to ensure no malicious software is present.
- Application whitelisting is a method of authorizing only the applications and processes that are necessary on the Transient Cyber Asset. This reduces the opportunity that malicious software could become resident, much less propagate, from the Transient Cyber Asset to the BES Cyber Asset or BES Cyber System.
- Restricted communication to limit the exchange of data to only the Transient Cyber Asset and the Cyber Assets to which it is connected by restricting or disabling serial or network (including wireless) communications on a managed Transient Cyber Asset can be used to minimize the opportunity to introduce malicious code onto the Transient Cyber Asset while it is not connected to BES Cyber Systems. This renders the device unable to communicate with devices other than the one to which it is connected.
- When selecting to use other methods that mitigate the introduction of malicious code to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the introduction of malicious code objective.

Section 1.5: Entities are to document and implement their process(es) to protect and evaluate Transient Cyber Assets to ensure they mitigate the risks that unauthorized use of the Transient Cyber Asset may present to the BES Cyber System. The concern addressed by this section is the possibility that the Transient Cyber Asset could be tampered with, or exposed to malware, while not in active use by an authorized person. Physical security of the Transient Cyber Asset is certainly a control that will mitigate this risk, but other tools and techniques are also available. The bulleted list of example protections provides some suggested alternatives.

- For restricted physical access, the intent is that the Transient Cyber Asset is maintained within a Physical Security Perimeter or other physical location or enclosure that uses physical access controls to protect the Transient Cyber Asset.
- Full disk encryption with authentication is an option that can be employed to protect a Transient Cyber Asset from unauthorized use. However, it is important that

authentication be required to decrypt the device. For example, pre-boot authentication, or power-on authentication, provides a secure, tamper-proof environment external to the operating system as a trusted authentication layer. Authentication prevents data from being read from the hard disk until the user has confirmed they have the correct password or other credentials. By performing the authentication prior to the system decrypting and booting, the risk that an unauthorized person may manipulate the Transient Cyber Asset is mitigated.

- Multi-factor authentication is used to ensure the identity of the person accessing the device. Multi-factor authentication also mitigates the risk that an unauthorized person may manipulate the Transient Cyber Asset.
- In addition to authentication and pure physical security methods, other alternatives are available that an entity may choose to employ. Certain theft recovery solutions can be used to locate the Transient Cyber Asset, detect access, remotely wipe, and lockout the system, thereby mitigating the potential threat from unauthorized use if the Transient Cyber Asset was later connected to a BES Cyber Asset. Other low tech solutions may also be effective to mitigate the risk of using a maliciously-manipulated Transient Cyber Asset, such as tamper evident tags or seals, and executing procedural controls to verify the integrity of the tamper evident tag or seal prior to use.
- When selecting to use other methods that mitigate the risk of unauthorized use to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the risk of unauthorized use objective.

Requirement R4, Attachment 1, Section 2 - Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity

The attachment also recognizes the lack of control for Transient Cyber Assets that are managed by parties other than the Responsible Entity. However, this does not obviate the Responsible Entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not manage. The requirements listed herein allow entities the ability to review the assets to the best of their capability and to meet their obligations.

To facilitate these controls, Responsible Entities may choose to execute agreements with other parties to provide support services to BES Cyber Systems and BES Cyber Assets that may involve the use of Transient Cyber Assets. Entities may consider using the Department of Energy Cybersecurity Procurement Language for Energy Delivery dated April 2014. [1] Procurement language may unify the other party and entity actions supporting the BES Cyber Systems and BES Cyber Assets. CIP program attributes may be considered including roles and responsibilities, access controls, monitoring, logging, vulnerability, and patch management along with incident response and back up recovery may be part of the other party's support.

[1] http://www.energy.gov/oe/downloads/cybersecurity-procurement-language-energy-delivery-april-2014

Entities should consider the "General Cybersecurity Procurement Language" and "The Supplier's Life Cycle Security Program" when drafting Master Service Agreements, Contracts, and the CIP program processes and controls.

Section 2.1: Entities are to document and implement their process(es) to mitigate software vulnerabilities through the use of one or more of the protective measures listed.

- Conduct a review of the Transient Cyber Asset managed by a party other than the Responsible Entity to determine whether the security patch level of the device is adequate to mitigate the risk of software vulnerabilities before connecting the Transient Cyber Asset to an applicable system.
- Conduct a review of the other party's security patching process. This can be done either at the time of contracting but no later than prior to connecting the Transient Cyber Asset to an applicable system. Just as with reviewing the security patch level of the device, selecting to use this approach aims to ensure that the Responsible Entity has mitigated the risk of software vulnerabilities to applicable systems.
- Conduct a review of other processes that the other party uses to mitigate the risk of software vulnerabilities. This can be reviewing system hardening, application whitelisting, virtual machines, etc.
- When selecting to use other methods to mitigate software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet mitigation of the risk of software vulnerabilities.

Section 2.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more of the protective measures listed.

- Review the use of antivirus software and signature or pattern levels to ensure that the level is adequate to the Responsible Entity to mitigate the risk of malicious software being introduced to an applicable system.
- Review the antivirus or endpoint security processes of the other party to ensure that their processes are adequate to the Responsible Entity to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of application whitelisting used by the other party to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of live operating systems or software executable only from read-only media to ensure that the media is free from malicious software itself. Entities should review the processes to build the read-only media as well as the media itself.
- Review system hardening practices used by the other party to ensure that unnecessary ports, services, applications, etc. have been disabled or removed. This will limit the chance of introducing malicious software to an applicable system.

Section 2.3: Determine whether additional mitigation actions are necessary, and implement such actions prior to connecting the Transient Cyber Asset managed by a party other than the Responsible Entity. The intent of this section is to ensure that after conducting the selected review from Sections 2.1 and 2.2, if there are deficiencies that do not meet the Responsible Entity's security posture, the other party is required to complete the mitigations prior to connecting their devices to an applicable system.

Requirement R4, Attachment 1, Section 3 - Removable Media

Entities have a high level of control for Removable Media that are going to be connected to their BES Cyber Assets.

Section 3.1: Entities are to document and implement their process(es) to authorize the use of Removable Media. The Removable Media may be listed individually or by type.

- Document the user(s), individually or by group/role, allowed to use the Removable Media. This can be done by listing a specific person, department, or job function. Authorization includes vendors and the entity's personnel. Caution: consider whether these user(s) must have authorized electronic access to the applicable system in accordance with CIP-004.
- Locations where the Removable Media may be used. This can be done by listing a specific location or a group/role of locations.

Section 3.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more method(s) to detect malicious code on the Removable Media before it is connected to a BES Cyber Asset. When using the method(s) to detect malicious code, it is expected to occur from a system that is not part of the BES Cyber System to reduce the risk of propagating malicious code into the BES Cyber System network or onto one of the BES Cyber Assets. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident. Frequency and timing of the methods used to detect malicious code were intentionally excluded from the requirement because there are multiple timing scenarios that can be incorporated into a plan to mitigate the risk of malicious code. The entities must use the method(s) to detect malicious code on Removable Media before it is connected to the BES Cyber Asset. The timing dictated and documented in the entity's plan should reduce the risk of introducing malicious code to the BES Cyber Asset or Protected Cyber Asset.

As a method to detect malicious code, entities may choose to use Removable Media with on-board malicious code detection tools. For these tools, the Removable Media are still used in conjunction with a Cyber Asset to perform the detection. For Section 3.2.1, the Cyber Asset used to perform the malicious code detection must be outside of the BES Cyber System or Protected Cyber Asset.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon Board adoption, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:
The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

Rationale for Requirement R2:
The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

Rationale for Requirement R3:
The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.
The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

Rationale for R4:
Requirement R4 responds to the directive in FERC Order No. 791, at Paragraphs 6 and 136, to address security-related issues associated with Transient Cyber Assets and Removable Media used on a temporary basis for tasks such as data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To mitigate the risks associated with such tools, Requirement R4 was developed to accomplish the following security objectives:

- Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and
- Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.

Requirement R4 incorporates the concepts from other CIP requirements in CIP-010 and CIP-007 to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes: All requirements related to Transient Cyber Assets and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	October 19, 2016
SAR posted for comment	October 20 - November 21, 2016
45-day formal comment period with ballot	May 2 – June 15, 2017

Anticipated Actions	Date
10-day final ballot	July 2017
NERC Board (Board) adoption	August 2017

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None

Upon Board adoption, the rationale boxes will be moved to the Supplemental Material Section.

A. Introduction

1. **Title:** Cyber Security — Configuration Change Management and Vulnerability Assessments

2. **Number:** CIP-010-3

3. **Purpose:** To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly. For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in Section 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-010-3:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes.

5. Effective Date:

See Implementation Plan for Project 2016-03.

6. Background: Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the

standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples

may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:
Proposed requirement R1 Part 1.6 addresses directives in Order No. 829 for verifying software integrity and authenticity prior to installation in BES Cyber Systems (P. 48).

The objective of verifying software integrity and authenticity is to ensure that the software being installed in the BES Cyber System was not modified without the awareness of the software supplier and is not counterfeit.

Guidance and examples are provided in the Guidelines and Technical Basis Section of this standard.

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-3 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-3 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

CIP-010-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.6	High Impact BES Cyber Systems Medium Impact BES Cyber Systems Note: Implementation does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Part 1.6: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.	~~For~~ Prior to a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5, and when the method to do so is available to the Responsible Entity from the software source: 1.6.1. Verify the identity of the software source; and 1.6.2. Verify the integrity of the software obtained from the software source.	An example of evidence may include, but is not limited to a change request record that demonstrates the verification of identity of the software source and integrity of the software was performed ~~during~~ prior to the baseline change or a process which documents the mechanisms in place that would automatically ensure the identity of the software source and integrity of the software.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-3 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-3 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-3 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-3 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-3 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

R4. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems and associated Protected Cyber Assets, shall implement, except under CIP Exceptional Circumstances, one or more documented plan(s) for Transient Cyber Assets

and Removable Media that include the sections in Attachment 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence shall include each of the documented plan(s) for Transient Cyber Assets and Removable Media that collectively include each of the applicable sections in Attachment 1 and additional evidence to demonstrate implementation of plan(s) for Transient Cyber Assets and Removable Media. Additional examples of evidence per section are located in Attachment 2. If a Responsible Entity does not use Transient Cyber Asset(s) or Removable Media, examples of evidence include, but are not limited to, a statement, policy, or other document that states the Responsible Entity does not use Transient Cyber Asset(s) or Removable Media.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only four of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only three of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only two of the required baseline items listed in 1.1.1 through 1.1.5. (1.1) OR The Responsible Entity has a process as specified in Part 1.6 to verify the identity of the software source (1.6.1) but does not have a process as specified in Part 1.6 to verify the integrity of the software provided by the software source when the method to do so is available to the Responsible Entity from the software source. (1.6.2)	The Responsible Entity has not documented or implemented any configuration change management process(es). (R1) OR The Responsible Entity has documented and implemented a configuration change management process(es) that includes only one of the required baseline items listed in 1.1.1 through 1.1.5. (1.1) OR The Responsible Entity does not have a process(es) that requires authorization and documentation of changes that deviate from the existing baseline configuration. (1.2)

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				OR The Responsible Entity does not have a process(es) to update baseline configurations within 30 calendar days of completing a change(s) that deviates from the existing baseline configuration.(1.3) OR The Responsible Entity does not have a process(es) to determine required security controls in CIP-005 and CIP-007 that could be impacted by a change(s) that deviates from the existing baseline configuration. (1.4.1) OR The Responsible Entity has a process(es) to determine required security controls in CIP-005 and CIP-007 that could be impacted by a change(s) that deviates from the existing baseline

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				configuration but did not verify and document that the required controls were not adversely affected following the change. (1.4.2 & 1.4.3) OR The Responsible Entity does not have a process for testing changes in an environment that models the baseline configuration prior to implementing a change that deviates from baseline configuration. (1.5.1) OR The Responsible Entity does not have a process to document the test results and, if using a test environment, document the differences between the test and production environments. (1.5.2)

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				OR The Responsible Entity does not have a process as specified in Part 1.6 to verify the identity of the software source and the integrity of the software provided by the software source when the method to do so is available to the Responsible Entity from the software source. (1.6)
R2.	N/A	N/A	N/A	The Responsible Entity has not documented or implemented a process(es) to monitor for, investigate, and document detected unauthorized changes to the baseline at least once every 35 calendar days. (2.1)
R3.	The Responsible Entity has implemented one or more documented vulnerability assessment processes for each of its applicable BES Cyber Systems, but has	The Responsible Entity has implemented one or more documented vulnerability assessment processes for each of its applicable BES Cyber Systems, but has	The Responsible Entity has implemented one or more documented vulnerability assessment processes for each of its applicable BES Cyber Systems, but has	The Responsible Entity has not implemented any vulnerability assessment processes for one of its

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
	performed a vulnerability assessment more than 15 months, but less than 18 months, since the last assessment on one of its applicable BES Cyber Systems. (3.1) OR The Responsible Entity has implemented one or more documented active vulnerability assessment processes for Applicable Systems, but has performed an active vulnerability assessment more than 36 months, but less than 39 months, since the last active assessment on one of its applicable BES Cyber Systems. CIP-010-3 - Attachment 1

Required Sections for Plans for Transient Cyber Assets and Removable Media

Responsible Entities shall include each of the sections provided below in their plan(s) for Transient Cyber Assets and Removable Media as required under Requirement R4.

Section 1. Transient Cyber Asset(s) Managed by the Responsible Entity.

1.1. Transient Cyber Asset Management: Responsible Entities shall manage Transient Cyber Asset(s), individually or by group: (1) in an ongoing manner to ensure compliance with applicable requirements at all times, (2) in an on-demand manner applying the applicable requirements before connection to a BES Cyber System, or (3) a combination of both (1) and (2) above.

1.2. Transient Cyber Asset Authorization: For each individual or group of Transient Cyber Asset(s), each Responsible Entity shall authorize:

1.2.1. Users, either individually or by group or role;

1.2.2. Locations, either individually or by group; and

1.2.3. Uses, which shall be limited to what is necessary to perform business functions.

1.3. Software Vulnerability Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of vulnerabilities posed by unpatched software on the Transient Cyber Asset (per Transient Cyber Asset capability):

- Security patching, including manual or managed updates;
- Live operating system and software executable only from read-only media;
- System hardening; or
- Other method(s) to mitigate software vulnerabilities.

1.4. Introduction of Malicious Code Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the introduction of malicious code (per Transient Cyber Asset capability):

- Antivirus software, including manual or managed updates of signatures or patterns;
- Application whitelisting; or
- Other method(s) to mitigate the introduction of malicious code.

1.5. Unauthorized Use Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of unauthorized use of Transient Cyber Asset(s):

- Restrict physical access;
- Full-disk encryption with authentication;
- Multi-factor authentication; or
- Other method(s) to mitigate the risk of unauthorized use.

Section 2. Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity.

2.1 Software Vulnerabilities Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of vulnerabilities posed by unpatched software on the Transient Cyber Asset (per Transient Cyber Asset capability):

- Review of installed security patch(es);
- Review of security patching process used by the party;
- Review of other vulnerability mitigation performed by the party; or
- Other method(s) to mitigate software vulnerabilities.

2.2 Introduction of malicious code mitigation: Use one or a combination of the following methods to achieve the objective of mitigating malicious code (per Transient Cyber Asset capability):

- Review of antivirus update level;
- Review of antivirus update process used by the party;
- Review of application whitelisting used by the party;
- Review use of live operating system and software executable only from read-only media;
- Review of system hardening used by the party; or
- Other method(s) to mitigate malicious code.

2.3 For any method used to mitigate software vulnerabilities or malicious code as specified in 2.1 and 2.2, Responsible Entities shall determine whether any additional mitigation actions are necessary and implement such actions prior to connecting the Transient Cyber Asset.

Section 3. Removable Media

3.1. Removable Media Authorization: For each individual or group of Removable Media, each Responsible Entity shall authorize:

3.1.1. Users, either individually or by group or role; and

3.1.2. Locations, either individually or by group.

3.2. Malicious Code Mitigation: To achieve the objective of mitigating the threat of introducing malicious code to high impact or medium impact BES Cyber Systems and their associated Protected Cyber Assets, each Responsible Entity shall:

3.2.1. Use method(s) to detect malicious code on Removable Media using a Cyber Asset other than a BES Cyber System or Protected Cyber Assets; and

3.2.2. Mitigate the threat of detected malicious code on Removable Media prior to connecting the Removable Media to a high impact or medium impact BES Cyber System or associated Protected Cyber Assets.

CIP-010-3 - Attachment 2

Examples of Evidence for Plans for Transient Cyber Assets and Removable Media

Section 1.1: Examples of evidence for Section 1.1 may include, but are not limited to, the method(s) of management for the Transient Cyber Asset(s). This can be included as part of the Transient Cyber Asset plan(s), part of the documentation related to authorization of Transient Cyber Asset(s) managed by the Responsible Entity or part of a security policy.

Section 1.2: Examples of evidence for Section 1.2 may include, but are not limited to, documentation from asset management systems, human resource management systems, or forms or spreadsheets that show authorization of Transient Cyber Asset(s) managed by the Responsible Entity. Alternatively, this can be documented in the overarching plan document.

Section 1.3: Examples of evidence for Section 1.3 may include, but are not limited to, documentation of the method(s) used to mitigate software vulnerabilities posed by unpatched software such as security patch management implementation, the use of live operating systems from read-only media, system hardening practices or other method(s) to mitigate the software vulnerability posed by unpatched software. Evidence can be from change management systems, automated patch management solutions, procedures or processes associated with using live operating systems, or procedures or processes associated with system hardening practices. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the vendor or Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 1.4: Examples of evidence for Section 1.4 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 1.5: Examples of evidence for Section 1.5 may include, but are not limited to, documentation through policies or procedures of the method(s) to restrict physical access; method(s) of the full-disk encryption solution along with the authentication protocol; method(s) of the multi-factor authentication solution; or documentation of other method(s) to mitigate the risk of unauthorized use.

Section 2.1: Examples of evidence for Section 2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of installed security patch(es); memoranda, electronic mail, policies or contracts from parties other than the Responsible Entity that identify the security patching process or vulnerability mitigation performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail, system documentation or contracts that identifies acceptance by the Responsible Entity that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate software vulnerabilities for Transient Cyber Asset(s) managed by a party other than the Responsible Entity. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 2.2: Examples of evidence for Section 2.2 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed antivirus update level; memoranda, electronic mail, system documentation, policies or contracts from the party other than the Responsible Entity that identify the antivirus update process, the use of application whitelisting, use of live of operating systems or system hardening performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that identifies the Responsible Entity's acceptance that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate malicious code for Transient Cyber Asset(s) managed by a party other than the Responsible Entity. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 2.3: Examples of evidence for Section 2.3 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigations are necessary and that they have been implemented prior to connecting the Transient Cyber Asset managed by a party other than the Responsible Entity.

Section 3.1: Examples of evidence for Section 3.1 may include, but are not limited to, documentation from asset management systems, human resource management systems, forms or spreadsheets that shows authorization of Removable Media. The documentation must identify Removable Media, individually or by group of Removable Media, along with the authorized users,

either individually or by group or role, and the authorized locations, either individually or by group.

Section 3.2: Examples of evidence for Section 3.2 may include, but are not limited to, documented process(es) of the method(s) used to mitigate malicious code such as results of scan settings for Removable Media, or implementation of on-demand scanning. Documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and that show mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included. Custom software installed may include scripts developed for local entity functions or

other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Software Verification~~Integrity and Authenticity~~

The concept of software verification (verifying the identity of the software source and the integrity of the software obtained from the software source~~and authenticity~~) is a key control in preventing the introduction of malware or counterfeit software. This objective is intended to reduce the likelihood that an attacker could exploit legitimate vendor patch management processes to deliver compromised software updates or patches to a BES Cyber System. The intent of the SDT is for Responsible Entities to provide controls for verifying the baseline elements that are updated by vendors. It is important to note that this is not limited to only security patches. ~~That is why the requirement was not placed in CIP-007 - Security Patch Management.~~

NIST SP-800-161 includes a number of security controls, which, when taken together, reduce the probability of a successful "Watering Hole" or similar cyber attack in the industrial control system environment and thus could assist in addressing this objective. For example, in the System and Information Integrity (SI) control family, control SI-7 suggests users obtain software directly from the developer and ~~that the integrity of information systems~~ verify the integrity of the software using controls such as digital signatures~~and obtaining software directly from the developer~~. In the Configuration Management (CM) control family, control CM-5(3) requires that the information system prevent the installation of firmware ~~of~~ or software without the verification that the component has been digitally signed to ensure that the hardware and software components are genuine and valid. NIST SP-800-161, while not meant to be definitive, provides examples of controls for addressing this objective. Other controls also could meet this objective.

~~It is not the intent of the SDT to require a verification of each source or software update at the time it is obtained. It is sufficient to establish the reliable source and software update once. This will allow automated solutions to be implemented to obtain frequent updates such as patches.~~

In implementing Requirement R1 Part 1.6, the responsible entity should consider their existing CIP cyber security policies and controls in addition to the following:

- Processes used to deliver software and appropriate control(s) that will verify the identity of the software source and the integrity of the software delivered through these processes. To the extent that the responsible entity utilizes automated systems such as a subscription service to download and distribute software including updates, consider how software verification can be performed through those processes.
- Coordination of the responsible entity's software verification control(s) with other cyber security policies and controls, including change management and patching processes, and procurement controls.
- Use of a secure central software repository after the identity of the software source and the integrity of the software have been validated, so that verifications do not need to be performed repeatedly before each installation.
- Additional controls such as examples outlined in the Software, Firmware, and Information Integrity (SI-7) section of NIST Special Publication 800-53 Revision 4, or similar guidance.
- Additional controls such as those defined in FIPS-140-2, FIPS 180-4, or similar guidance, to ensure the cryptographic methods used are acceptable to the Responsible Entity.

Responsible entities may use various methods to verify the integrity of software obtained from the software source. Examples include, but are not limited to, the following:

- Verify that the software has been digitally signed and validate the signature to ensure that the software's integrity has not been compromised.
- Use public key infrastructure (PKI) with encryption to ensure that the software is not modified in transit by enabling only intended recipients to decrypt the software.
- Require software sources to provide fingerprints or cipher hashes for all software and verify the values prior to installation on a BES Cyber System to ensure the integrity of the software. Consider using a method for receiving the verification values that is different from the method used to receive the software from the software source.
- Use trusted/controlled distribution and delivery options to reduce supply chain risk (e.g., requiring tamper-evident packaging of software during shipping.)

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.
2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.
3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Requirement R4:

Because most BES Cyber Assets and BES Cyber Systems are isolated from external public or untrusted networks, Transient Cyber Assets and Removable Media are a means for cyber-attack. Transient Cyber Assets and Removable Media are often the only way to transport files to and from secure areas to maintain, monitor, or troubleshoot critical systems. To protect the BES Cyber Assets and BES Cyber Systems, entities are required to document and implement a plan for how they will manage the use of Transient Cyber Assets and Removable Media. The

approach of defining a plan allows the Responsible Entity to document the processes that are supportable within its organization and in alignment with its change management processes.

Transient Cyber Assets and Removable Media are those devices connected temporarily to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Transient Cyber Assets and Removable Media do not provide BES reliability services and are not part of the BES Cyber Asset to which they are connected. Examples of these temporarily connected devices include, but are not limited to:

- Diagnostic test equipment;
- Packet sniffers;
- Equipment used for BES Cyber System maintenance;
- Equipment used for BES Cyber System configuration; or
- Equipment used to perform vulnerability assessments.

Transient Cyber Assets can be one of many types of devices from a specially-designed device for maintaining equipment in support of the BES to a platform such as a laptop, desktop, or tablet that may just interface with or run applications that support BES Cyber Systems and is capable of transmitting executable code. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

While the definitions of Transient Cyber Asset and Removable Media include a conditional provision that requires them to be connected for 30 days or less, Section 1.1 of Attachment 1 allows the Responsible Entity to include provisions in its plan(s) that allow continuous or on-demand treatment and application of controls independent of the connected state. Please note that for on-demand treatment, the requirements only apply when Transient Cyber Assets and Removable Media are being connected to a BES Cyber System or Protected Cyber Asset. Once the transient device is disconnected, the requirements listed herein are not applicable until that Transient Cyber Asset or Removable Media is to be reconnected to the BES Cyber Asset or Protected Cyber Asset.

The attachment was created to specify the capabilities and possible security methods available to Responsible Entities based upon asset type, ownership, and management.

With the list of options provided in Attachment 1 for each control area, the entity has the discretion to use the option(s) that is most appropriate. This includes documenting its approach for how and when the entity manages or reviews the Transient Cyber Asset under its control or under the control of parties other than the Responsible Entity. The entity should avoid implementing a security function that jeopardizes reliability by taking actions that would negatively impact the performance or support of the Transient Cyber Asset, BES Cyber Asset, or Protected Cyber Asset.

Vulnerability Mitigation

The terms “mitigate”, “mitigating”, and “mitigation” are used in the sections in Attachment 1 to address the risks posed by malicious code, software vulnerabilities, and unauthorized use when

connecting Transient Cyber Assets and Removable Media. Mitigation in this context does not require that each vulnerability is individually addressed or remediated, as many may be unknown or not have an impact on the system to which the Transient Cyber Asset or Removable Media is connected. Mitigation is meant to reduce security risks presented by connecting the Transient Cyber Asset.

Per Transient Cyber Asset Capability

As with other CIP standards, the requirements are intended for an entity to use the method(s) that the system is capable of performing. The use of "per Transient Cyber Asset capability" is to eliminate the need for a Technical Feasibility Exception when it is understood that the device cannot use a method(s). For example, for malicious code, many types of appliances are not capable of implementing antivirus software; therefore, because it is not a capability of those types of devices, implementation of the antivirus software would not be required for those devices.

Requirement R4, Attachment 1, Section 1 - Transient Cyber Asset(s) Managed by the Responsible Entity

Section 1.1: Entities have a high level of control for the assets that they manage. The requirements listed herein allow entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection or use a combination of these methods. The devices may be managed individually or by group.

Section 1.2: Entities are to document and implement their process(es) to authorize the use of Transient Cyber Assets for which they have direct management. The Transient Cyber Assets may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:

1.2.1 User(s), individually or by group/role, allowed to use the Transient Cyber Asset(s). This can be done by listing a specific person, department, or job function. Caution: consider whether these user(s) must also have authorized electronic access to the applicable system in accordance with CIP-004.

1.2.2 Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group of locations.

1.2.3 The intended or approved use of each individual, type, or group of Transient Cyber Asset. This should also include the software or application packages that are authorized with the purpose of performing defined business functions or tasks (e.g., used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes), and approved network interfaces (e.g., wireless, including near field communication or Bluetooth, and wired connections). Activities, and software or application packages, not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals through the CIP-004 Security Awareness Program and Cyber Security Training Program about authorized and unauthorized activities or uses (e.g.,

using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).

Entities should exercise caution when using Transient Cyber Assets and ensure they do not have features enabled (e.g., wireless or Bluetooth features) in a manner that would allow the device to bridge an outside network to an applicable system. Doing so would cause the Transient Cyber Asset to become an unauthorized Electronic Access Point in violation of CIP-005, Requirement R1.

Attention should be paid to Transient Cyber Assets that may be used for assets in differing impact areas (i.e., high impact, medium impact, and low impact). These impact areas have differing levels of protection under the CIP requirements, and measures should be taken to prevent the introduction of malicious code from a lower impact area. An entity may want to consider the need to have separate Transient Cyber Assets for each impact level.

Section 1.3: Entities are to document and implement their process(es) to mitigate software vulnerabilities posed by unpatched software through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. Recognizing there is a huge diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in software vulnerability management solutions, options are listed that include the alternative for the entity to use a technology or process that effectively mitigates vulnerabilities.

- Security patching, including manual or managed updates provides flexibility to the Responsible Entity to determine how its Transient Cyber Asset(s) will be used. It is possible for an entity to have its Transient Cyber Asset be part of an enterprise patch process and receive security patches on a regular schedule or the entity can verify and apply security patches prior to connecting the Transient Cyber Asset to an applicable Cyber Asset. Unlike CIP-007, Requirement R2, there is no expectation of creating dated mitigation plans or other documentation other than what is necessary to identify that the Transient Cyber Asset is receiving appropriate security patches.
- Live operating system and software executable only from read-only media is provided to allow a protected operating system that cannot be modified to deliver malicious software. When entities are creating custom live operating systems, they should check the image during the build to ensure that there is not malicious software on the image.
- System hardening, also called operating system hardening, helps minimize security vulnerabilities by removing all non-essential software programs and utilities and only installing the bare necessities that the computer needs to function. While other programs may provide useful features, they can provide "back-door" access to the system, and should be removed to harden the system.
- When selecting to use other methods that mitigate software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet the software vulnerability mitigation objective.

Section 1.4: Entities are to document and implement their process(es) to mitigate malicious code through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. As with vulnerability management, there is diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in malicious code protections. When addressing malicious code protection, the Responsible Entity should address methods deployed to deter, detect, or prevent malicious code. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

- Antivirus software, including manual or managed updates of signatures or patterns, provides flexibility just as with security patching, to manage Transient Cyber Asset(s) by deploying antivirus or endpoint security tools that maintain a scheduled update of the signatures or patterns. Also, for devices that do not regularly connect to receive scheduled updates, entities may choose to scan the Transient Cyber Asset prior to connection to ensure no malicious software is present.
- Application whitelisting is a method of authorizing only the applications and processes that are necessary on the Transient Cyber Asset. This reduces the opportunity that malicious software could become resident, much less propagate, from the Transient Cyber Asset to the BES Cyber Asset or BES Cyber System.
- Restricted communication to limit the exchange of data to only the Transient Cyber Asset and the Cyber Assets to which it is connected by restricting or disabling serial or network (including wireless) communications on a managed Transient Cyber Asset can be used to minimize the opportunity to introduce malicious code onto the Transient Cyber Asset while it is not connected to BES Cyber Systems. This renders the device unable to communicate with devices other than the one to which it is connected.
- When selecting to use other methods that mitigate the introduction of malicious code to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the introduction of malicious code objective.

Section 1.5: Entities are to document and implement their process(es) to protect and evaluate Transient Cyber Assets to ensure they mitigate the risks that unauthorized use of the Transient Cyber Asset may present to the BES Cyber System. The concern addressed by this section is the possibility that the Transient Cyber Asset could be tampered with, or exposed to malware, while not in active use by an authorized person. Physical security of the Transient Cyber Asset is certainly a control that will mitigate this risk, but other tools and techniques are also available. The bulleted list of example protections provides some suggested alternatives.

- For restricted physical access, the intent is that the Transient Cyber Asset is maintained within a Physical Security Perimeter or other physical location or enclosure that uses physical access controls to protect the Transient Cyber Asset.
- Full disk encryption with authentication is an option that can be employed to protect a Transient Cyber Asset from unauthorized use. However, it is important that

authentication be required to decrypt the device. For example, pre-boot authentication, or power-on authentication, provides a secure, tamper-proof environment external to the operating system as a trusted authentication layer. Authentication prevents data from being read from the hard disk until the user has confirmed they have the correct password or other credentials. By performing the authentication prior to the system decrypting and booting, the risk that an unauthorized person may manipulate the Transient Cyber Asset is mitigated.

- Multi-factor authentication is used to ensure the identity of the person accessing the device. Multi-factor authentication also mitigates the risk that an unauthorized person may manipulate the Transient Cyber Asset.
- In addition to authentication and pure physical security methods, other alternatives are available that an entity may choose to employ. Certain theft recovery solutions can be used to locate the Transient Cyber Asset, detect access, remotely wipe, and lockout the system, thereby mitigating the potential threat from unauthorized use if the Transient Cyber Asset was later connected to a BES Cyber Asset. Other low tech solutions may also be effective to mitigate the risk of using a maliciously-manipulated Transient Cyber Asset, such as tamper evident tags or seals, and executing procedural controls to verify the integrity of the tamper evident tag or seal prior to use.
- When selecting to use other methods that mitigate the risk of unauthorized use to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the risk of unauthorized use objective.

Requirement R4, Attachment 1, Section 2 - Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity

The attachment also recognizes the lack of control for Transient Cyber Assets that are managed by parties other than the Responsible Entity. However, this does not obviate the Responsible Entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not manage. The requirements listed herein allow entities the ability to review the assets to the best of their capability and to meet their obligations.

To facilitate these controls, Responsible Entities may choose to execute agreements with other parties to provide support services to BES Cyber Systems and BES Cyber Assets that may involve the use of Transient Cyber Assets. Entities may consider using the Department of Energy Cybersecurity Procurement Language for Energy Delivery dated April 2014. [1] Procurement language may unify the other party and entity actions supporting the BES Cyber Systems and BES Cyber Assets. CIP program attributes may be considered including roles and responsibilities, access controls, monitoring, logging, vulnerability, and patch management along with incident response and back up recovery may be part of the other party's support. Entities should consider the "General Cybersecurity Procurement Language" and "The Supplier's Life Cycle Security Program" when drafting Master Service Agreements, Contracts, and the CIP program processes and controls.

Section 2.1: Entities are to document and implement their process(es) to mitigate software vulnerabilities through the use of one or more of the protective measures listed.

- Conduct a review of the Transient Cyber Asset managed by a party other than the Responsible Entity to determine whether the security patch level of the device is adequate to mitigate the risk of software vulnerabilities before connecting the Transient Cyber Asset to an applicable system.
- Conduct a review of the other party's security patching process. This can be done either at the time of contracting but no later than prior to connecting the Transient Cyber Asset to an applicable system. Just as with reviewing the security patch level of the device, selecting to use this approach aims to ensure that the Responsible Entity has mitigated the risk of software vulnerabilities to applicable systems.
- Conduct a review of other processes that the other party uses to mitigate the risk of software vulnerabilities. This can be reviewing system hardening, application whitelisting, virtual machines, etc.
- When selecting to use other methods to mitigate software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet mitigation of the risk of software vulnerabilities.

[1] http://www.energy.gov/oe/downloads/cybersecurity-procurement-language-energy-delivery-april-2014

Section 2.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more of the protective measures listed.

- Review the use of antivirus software and signature or pattern levels to ensure that the level is adequate to the Responsible Entity to mitigate the risk of malicious software being introduced to an applicable system.
- Review the antivirus or endpoint security processes of the other party to ensure that their processes are adequate to the Responsible Entity to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of application whitelisting used by the other party to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of live operating systems or software executable only from read-only media to ensure that the media is free from malicious software itself. Entities should review the processes to build the read-only media as well as the media itself.
- Review system hardening practices used by the other party to ensure that unnecessary ports, services, applications, etc. have been disabled or removed. This will limit the chance of introducing malicious software to an applicable system.

Section 2.3: Determine whether additional mitigation actions are necessary, and implement such actions prior to connecting the Transient Cyber Asset managed by a party other than the Responsible Entity. The intent of this section is to ensure that after conducting the selected review from Sections 2.1 and 2.2, if there are deficiencies that do not meet the Responsible Entity's security posture, the other party is required to complete the mitigations prior to connecting their devices to an applicable system.

Requirement R4, Attachment 1, Section 3 - Removable Media

Entities have a high level of control for Removable Media that are going to be connected to their BES Cyber Assets.

Section 3.1: Entities are to document and implement their process(es) to authorize the use of Removable Media. The Removable Media may be listed individually or by type.

- Document the user(s), individually or by group/role, allowed to use the Removable Media. This can be done by listing a specific person, department, or job function. Authorization includes vendors and the entity's personnel. Caution: consider whether these user(s) must have authorized electronic access to the applicable system in accordance with CIP-004.
- Locations where the Removable Media may be used. This can be done by listing a specific location or a group/role of locations.

Section 3.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more method(s) to detect malicious code on the Removable Media before it is connected to a BES Cyber Asset. When using the method(s) to detect malicious code, it is expected to occur from a system that is not part of the

BES Cyber System to reduce the risk of propagating malicious code into the BES Cyber System network or onto one of the BES Cyber Assets. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident. Frequency and timing of the methods used to detect malicious code were intentionally excluded from the requirement because there are multiple timing scenarios that can be incorporated into a plan to mitigate the risk of malicious code. The entities must use the method(s) to detect malicious code on Removable Media before it is connected to the BES Cyber Asset. The timing dictated and documented in the entity's plan should reduce the risk of introducing malicious code to the BES Cyber Asset or Protected Cyber Asset.

As a method to detect malicious code, entities may choose to use Removable Media with on-board malicious code detection tools. For these tools, the Removable Media are still used in conjunction with a Cyber Asset to perform the detection. For Section 3.2.1, the Cyber Asset used to perform the malicious code detection must be outside of the BES Cyber System or Protected Cyber Asset.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon Board adoption, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:
The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

Rationale for Requirement R2:
The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

Rationale for Requirement R3:
The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.
The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

Rationale for R4:
Requirement R4 responds to the directive in FERC Order No. 791, at Paragraphs 6 and 136, to address security-related issues associated with Transient Cyber Assets and Removable Media used on a temporary basis for tasks such as data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To mitigate the risks associated with such tools, Requirement R4 was developed to accomplish the following security objectives:

- Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and
- Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.

Requirement R4 incorporates the concepts from other CIP requirements in CIP-010 and CIP-007 to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes: All requirements related to Transient Cyber Assets and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes.

A. Introduction

1. **Title:** Cyber Security — Configuration Change Management and Vulnerability Assessments

2. **Number:** CIP-0~~10-2~~10-3

3. **Purpose:** To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the Bulk Electric System (BES).

4. **Applicability:**

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each ~~Special Protection System (SPS) or~~ Remedial Action Scheme (RAS) where the ~~SPS or~~ RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each ~~SPS or~~ RAS where the ~~SPS or~~ RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**:

All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-0~~10-2~~10-3:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for ~~CIP-010-2~~Project 2016-03.

6. Background:

Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show

documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the BES. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:
Proposed requirement R1 Part 1.6 addresses directives in Order No. 829 for verifying software integrity and authenticity prior to installation in BES Cyber Systems (P. 48).

The objective of verifying software integrity and authenticity is to ensure that the software being installed in the BES Cyber System was not modified without the awareness of the software supplier and is not counterfeit.

Guidance and examples are provided in the Guidelines and Technical Basis Section of this standard.

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-0~~10-2~~10-3 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-0~~10-2~~10-3 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-0~~10-2~~10-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-0~~10-2~~10-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-0~~10-2~~10-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-0~~10-2~~10-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

CIP-0~~10-2~~10-3 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.6	High Impact BES Cyber Systems Medium Impact BES Cyber Systems Note: Implementation does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Part 1.6: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.	Prior to a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5, and when the method to do so is available to the Responsible Entity from the software source: 1.6.1. Verify the identity of the software source; and 1.6.2. Verify the integrity of the software obtained from the software source.	An example of evidence may include, but is not limited to a change request record that demonstrates the verification of identity of the software source and integrity of the software was performed prior to the baseline change or a process which documents the mechanisms in place that would automatically ensure the identity of the software source and integrity of the software.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-0~~10-2~~10-3 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-0~~10-2~~10-3 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-0~~10-2~~10-3 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-0~~10-2~~10-3 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-0~~10-2~~10-3 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-0~~10-2~~10-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-0~~10-2~~10-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-0~~10-2~~10-3 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

R4. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems and associated Protected Cyber Assets, shall implement, except under CIP Exceptional Circumstances, one or more documented plan(s) for Transient Cyber Assets and Removable Media that include the sections in Attachment 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence shall include each of the documented plan(s) for Transient Cyber Assets and Removable Media that collectively include each of the applicable sections in Attachment 1 and additional evidence to demonstrate implementation of plan(s) for Transient Cyber Assets and Removable Media. Additional examples of evidence per section are located in Attachment 2. If a Responsible Entity does not use Transient Cyber Asset(s) or Removable Media, examples of evidence include, but are not limited to, a statement, policy, or other document that states the Responsible Entity does not use Transient Cyber Asset(s) or Removable Media.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	
2	11/13/14	Adopted by the NERC Board of Trustees.	Addressed two FERC directives from Order No. 791 related to identify, assess, and correct language and communication networks.
2	2/12/15	Adopted by the NERC Board of Trustees.	Replaces the version adopted by the Board on 11/13/2014. Revised version addresses remaining directives from Order No. 791 related to transient devices and low impact BES Cyber Systems.
2	1/21/16	FERC Order issued approving CIP-010-2. Docket No. RM15-14-000	

3	tbd	Modified to address certain directives in FERC Order No. 829.	Revised

CIP-0~~10-2~~10-3 - Attachment 1

Required Sections for Plans for Transient Cyber Assets and Removable Media

Responsible Entities shall include each of the sections provided below in their plan(s) for Transient Cyber Assets and Removable Media as required under Requirement R4.

Section 1. Transient Cyber Asset(s) Managed by the Responsible Entity.

1.1. Transient Cyber Asset Management: Responsible Entities shall manage Transient Cyber Asset(s), individually or by group: (1) in an ongoing manner to ensure compliance with applicable requirements at all times, (2) in an on-demand manner applying the applicable requirements before connection to a BES Cyber System, or (3) a combination of both (1) and (2) above.

1.2. Transient Cyber Asset Authorization: For each individual or group of Transient Cyber Asset(s), each Responsible Entity shall authorize:

1.2.1. Users, either individually or by group or role;

1.2.2. Locations, either individually or by group; and

1.2.3. Uses, which shall be limited to what is necessary to perform business functions.

1.3. Software Vulnerability Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of vulnerabilities posed by unpatched software on the Transient Cyber Asset (per Transient Cyber Asset capability):

- Security patching, including manual or managed updates;
- Live operating system and software executable only from read-only media;
- System hardening; or
- Other method(s) to mitigate software vulnerabilities.

1.4. Introduction of Malicious Code Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the introduction of malicious code (per Transient Cyber Asset capability):

- Antivirus software, including manual or managed updates of signatures or patterns;
- Application whitelisting; or
- Other method(s) to mitigate the introduction of malicious code.

1.5. Unauthorized Use Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of unauthorized use of Transient Cyber Asset(s):

- Restrict physical access;
- Full-disk encryption with authentication;
- Multi-factor authentication; or
- Other method(s) to mitigate the risk of unauthorized use.

Section 2. Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity.

2.1 Software Vulnerabilities Mitigation: Use one or a combination of the following methods to achieve the objective of mitigating the risk of vulnerabilities posed by unpatched software on the Transient Cyber Asset (per Transient Cyber Asset capability):

- Review of installed security patch(es);
- Review of security patching process used by the party;
- Review of other vulnerability mitigation performed by the party; or
- Other method(s) to mitigate software vulnerabilities.

2.2 Introduction of malicious code mitigation: Use one or a combination of the following methods to achieve the objective of mitigating malicious code (per Transient Cyber Asset capability):

- Review of antivirus update level;
- Review of antivirus update process used by the party;
- Review of application whitelisting used by the party;
- Review use of live operating system and software executable only from read-only media;
- Review of system hardening used by the party; or
- Other method(s) to mitigate malicious code.

2.3 For any method used to mitigate software vulnerabilities or malicious code as specified in 2.1 and 2.2, Responsible Entities shall determine whether any additional mitigation actions are necessary and implement such actions prior to connecting the Transient Cyber Asset.

Section 3. Removable Media

3.1. Removable Media Authorization: For each individual or group of Removable Media, each Responsible Entity shall authorize:

3.1.1. Users, either individually or by group or role; and

3.1.2. Locations, either individually or by group.

3.2. Malicious Code Mitigation: To achieve the objective of mitigating the threat of introducing malicious code to high impact or medium impact BES Cyber Systems and their associated Protected Cyber Assets, each Responsible Entity shall:

3.2.1. Use method(s) to detect malicious code on Removable Media using a Cyber Asset other than a BES Cyber System or Protected Cyber Assets; and

3.2.2. Mitigate the threat of detected malicious code on Removable Media prior to connecting the Removable Media to a high impact or medium impact BES Cyber System or associated Protected Cyber Assets.

CIP-0~~10-2~~10-3 - Attachment 2

Examples of Evidence for Plans for Transient Cyber Assets and Removable Media

Section 1.1: Examples of evidence for Section 1.1 may include, but are not limited to, the method(s) of management for the Transient Cyber Asset(s). This can be included as part of the Transient Cyber Asset plan(s), part of the documentation related to authorization of Transient Cyber Asset(s) managed by the Responsible Entity or part of a security policy.

Section 1.2: Examples of evidence for Section 1.2 may include, but are not limited to, documentation from asset management systems, human resource management systems, or forms or spreadsheets that show authorization of Transient Cyber Asset(s) managed by the Responsible Entity. Alternatively, this can be documented in the overarching plan document.

Section 1.3: Examples of evidence for Section 1.3 may include, but are not limited to, documentation of the method(s) used to mitigate software vulnerabilities posed by unpatched software such as security patch management implementation, the use of live operating systems from read-only media, system hardening practices or other method(s) to mitigate the software vulnerability posed by unpatched software. Evidence can be from change management systems, automated patch management solutions, procedures or processes associated with using live operating systems, or procedures or processes associated with system hardening practices. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the vendor or Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 1.4: Examples of evidence for Section 1.4 may include, but are not limited to, documentation of the method(s) used to mitigate the introduction of malicious code such as antivirus software and processes for managing signature or pattern updates, application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the vendor or Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 1.5: Examples of evidence for Section 1.5 may include, but are not limited to, documentation through policies or procedures of the method(s) to restrict physical access; method(s) of the full-disk encryption solution along with the authentication protocol; method(s) of the multi-factor authentication solution; or documentation of other method(s) to mitigate the risk of unauthorized use.

Section 2.1: Examples of evidence for Section 2.1 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of installed security patch(es); memoranda, electronic mail, policies or contracts from parties other than the Responsible Entity that identify the security patching process or vulnerability mitigation performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail, system documentation or contracts that identifies acceptance by the Responsible Entity that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate software vulnerabilities for Transient Cyber Asset(s) managed by a party other than the Responsible Entity. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the risk from unpatched software, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 2.2: Examples of evidence for Section 2.2 may include, but are not limited to, documentation from change management systems, electronic mail or procedures that document a review of the installed antivirus update level; memoranda, electronic mail, system documentation, policies or contracts from the party other than the Responsible Entity that identify the antivirus update process, the use of application whitelisting, use of live of operating systems or system hardening performed by the party other than the Responsible Entity; evidence from change management systems, electronic mail or contracts that identifies the Responsible Entity's acceptance that the practices of the party other than the Responsible Entity are acceptable; or documentation of other method(s) to mitigate malicious code for Transient Cyber Asset(s) managed by a party other than the Responsible Entity. If a Transient Cyber Asset does not have the capability to use method(s) that mitigate the introduction of malicious code, evidence may include documentation by the Responsible Entity or the party other than the Responsible Entity that identifies that the Transient Cyber Asset does not have the capability.

Section 2.3: Examples of evidence for Section 2.3 may include, but are not limited to, documentation from change management systems, electronic mail, or contracts that identifies a review to determine whether additional mitigations are necessary and that they have been implemented prior to connecting the Transient Cyber Asset managed by a party other than the Responsible Entity.

Section 3.1: Examples of evidence for Section 3.1 may include, but are not limited to, documentation from asset management systems, human resource management systems, forms or spreadsheets that shows authorization of Removable Media. The documentation must identify Removable Media, individually or by group of Removable Media, along with the authorized users,

either individually or by group or role, and the authorized locations, either individually or by group.

Section 3.2: Examples of evidence for Section 3.2 may include, but are not limited to, documented process(es) of the method(s) used to mitigate malicious code such as results of scan settings for Removable Media, or implementation of on-demand scanning. Documented process(es) for the method(s) used for mitigating the threat of detected malicious code on Removable Media, such as logs from the method(s) used to detect malicious code that show the results of scanning and that show mitigation of detected malicious code on Removable Media or documented confirmation by the entity that the Removable Media was deemed to be free of malicious code.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included. Custom software installed may include scripts developed for local entity functions or other custom software developed for a specific task or function for the entity's use. If

additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a

major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Software Verification

The concept of software verification (verifying the identity of the software source and the integrity of the software obtained from the software source) is a key control in preventing the introduction of malware or counterfeit software. This objective is intended to reduce the likelihood that an attacker could exploit legitimate vendor patch management processes to deliver compromised software updates or patches to a BES Cyber System. The intent of the SDT is for Responsible Entities to provide controls for verifying the baseline elements that are updated by vendors. It is important to note that this is not limited to only security patches.

NIST SP-800-161 includes a number of security controls, which, when taken together, reduce the probability of a successful "Watering Hole" or similar cyber attack in the industrial control system environment and thus could assist in addressing this objective. For example, in the System and Information Integrity (SI) control family, control SI-7 suggests users obtain software directly from the developer and verify the integrity of the software using controls such as digital signatures. In the Configuration Management (CM) control family, control CM-5(3) requires that the information system prevent the installation of firmware or software without the verification that the component has been digitally signed to ensure that the hardware and software components are genuine and valid. NIST SP-800-161, while not meant to be definitive, provides examples of controls for addressing this objective. Other controls also could meet this objective.

In implementing Requirement R1 Part 1.6, the responsible entity should consider their existing CIP cyber security policies and controls in addition to the following:

- Processes used to deliver software and appropriate control(s) that will verify the identity of the software source and the integrity of the software delivered through these processes. To the extent that the responsible entity utilizes automated systems such as a subscription service to download and distribute software including updates, consider how software verification can be performed through those processes.
- Coordination of the responsible entity's software verification control(s) with other cyber security policies and controls, including change management and patching processes, and procurement controls.
- Use of a secure central software repository after the identity of the software source and the integrity of the software have been validated, so that verifications do not need to be performed repeatedly before each installation.
- Additional controls such as examples outlined in the Software, Firmware, and Information Integrity (SI-7) section of NIST Special Publication 800-53 Revision 4, or similar guidance.
- Additional controls such as those defined in FIPS-140-2, FIPS 180-4, or similar guidance, to ensure the cryptographic methods used are acceptable to the Responsible Entity.

Responsible entities may use various methods to verify the integrity of software obtained from the software source. Examples include, but are not limited to, the following:

- Verify that the software has been digitally signed and validate the signature to ensure that the software's integrity has not been compromised.
- Use public key infrastructure (PKI) with encryption to ensure that the software is not modified in transit by enabling only intended recipients to decrypt the software.
- Require software sources to provide fingerprints or cipher hashes for all software and verify the values prior to installation on a BES Cyber System to ensure the integrity of the software. Consider using a method for receiving the verification values that is different from the method used to receive the software from the software source.
- Use trusted/controlled distribution and delivery options to reduce supply chain risk (e.g., requiring tamper-evident packaging of software during shipping.)

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.
2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.
3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Requirement R4:

Because most BES Cyber Assets and BES Cyber Systems are isolated from external public or untrusted networks, Transient Cyber Assets and Removable Media are a means for cyber-attack. Transient Cyber Assets and Removable Media are often the only way to transport files to and from secure areas to maintain, monitor, or troubleshoot critical systems. To protect the BES Cyber Assets and BES Cyber Systems, entities are required to document and implement a plan for how they will manage the use of Transient Cyber Assets and Removable Media. The

approach of defining a plan allows the Responsible Entity to document the processes that are supportable within its organization and in alignment with its change management processes.

Transient Cyber Assets and Removable Media are those devices connected temporarily to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Transient Cyber Assets and Removable Media do not provide BES reliability services and are not part of the BES Cyber Asset to which they are connected. Examples of these temporarily connected devices include, but are not limited to:

- Diagnostic test equipment;
- Packet sniffers;
- Equipment used for BES Cyber System maintenance;
- Equipment used for BES Cyber System configuration; or
- Equipment used to perform vulnerability assessments.

Transient Cyber Assets can be one of many types of devices from a specially-designed device for maintaining equipment in support of the BES to a platform such as a laptop, desktop, or tablet that may just interface with or run applications that support BES Cyber Systems and is capable of transmitting executable code. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

While the definitions of Transient Cyber Asset and Removable Media include a conditional provision that requires them to be connected for 30 days or less, Section 1.1 of Attachment 1 allows the Responsible Entity to include provisions in its plan(s) that allow continuous or on-demand treatment and application of controls independent of the connected state. Please note that for on-demand treatment, the requirements only apply when Transient Cyber Assets and Removable Media are being connected to a BES Cyber System or Protected Cyber Asset. Once the transient device is disconnected, the requirements listed herein are not applicable until that Transient Cyber Asset or Removable Media is to be reconnected to the BES Cyber Asset or Protected Cyber Asset.

The attachment was created to specify the capabilities and possible security methods available to Responsible Entities based upon asset type, ownership, and management.

With the list of options provided in Attachment 1 for each control area, the entity has the discretion to use the option(s) that is most appropriate. This includes documenting its approach for how and when the entity manages or reviews the Transient Cyber Asset under its control or under the control of parties other than the Responsible Entity. The entity should avoid implementing a security function that jeopardizes reliability by taking actions that would negatively impact the performance or support of the Transient Cyber Asset, BES Cyber Asset, or Protected Cyber Asset.

Vulnerability Mitigation

The terms “mitigate”, “mitigating”, and “mitigation” are used in the sections in Attachment 1 to address the risks posed by malicious code, software vulnerabilities, and unauthorized use when

connecting Transient Cyber Assets and Removable Media. Mitigation in this context does not require that each vulnerability is individually addressed or remediated, as many may be unknown or not have an impact on the system to which the Transient Cyber Asset or Removable Media is connected. Mitigation is meant to reduce security risks presented by connecting the Transient Cyber Asset.

Per Transient Cyber Asset Capability

As with other CIP standards, the requirements are intended for an entity to use the method(s) that the system is capable of performing. The use of "per Transient Cyber Asset capability" is to eliminate the need for a Technical Feasibility Exception when it is understood that the device cannot use a method(s). For example, for malicious code, many types of appliances are not capable of implementing antivirus software; therefore, because it is not a capability of those types of devices, implementation of the antivirus software would not be required for those devices.

Requirement R4, Attachment 1, Section 1 - Transient Cyber Asset(s) Managed by the Responsible Entity

Section 1.1: Entities have a high level of control for the assets that they manage. The requirements listed herein allow entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection or use a combination of these methods. The devices may be managed individually or by group.

Section 1.2: Entities are to document and implement their process(es) to authorize the use of Transient Cyber Assets for which they have direct management. The Transient Cyber Assets may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:

1.2.1 User(s), individually or by group/role, allowed to use the Transient Cyber Asset(s). This can be done by listing a specific person, department, or job function. Caution: consider whether these user(s) must also have authorized electronic access to the applicable system in accordance with CIP-004.

1.2.2 Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group of locations.

1.2.3 The intended or approved use of each individual, type, or group of Transient Cyber Asset. This should also include the software or application packages that are authorized with the purpose of performing defined business functions or tasks (e.g., used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes), and approved network interfaces (e.g., wireless, including near field communication or Bluetooth, and wired connections). Activities, and software or application packages, not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals through the CIP-004 Security Awareness Program and Cyber Security Training Program about authorized and unauthorized activities or uses (e.g.,

using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).

Entities should exercise caution when using Transient Cyber Assets and ensure they do not have features enabled (e.g., wireless or Bluetooth features) in a manner that would allow the device to bridge an outside network to an applicable system. Doing so would cause the Transient Cyber Asset to become an unauthorized Electronic Access Point in violation of CIP-005, Requirement R1.

Attention should be paid to Transient Cyber Assets that may be used for assets in differing impact areas (i.e., high impact, medium impact, and low impact). These impact areas have differing levels of protection under the CIP requirements, and measures should be taken to prevent the introduction of malicious code from a lower impact area. An entity may want to consider the need to have separate Transient Cyber Assets for each impact level.

Section 1.3: Entities are to document and implement their process(es) to mitigate software vulnerabilities posed by unpatched software through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. Recognizing there is a huge diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in software vulnerability management solutions, options are listed that include the alternative for the entity to use a technology or process that effectively mitigates vulnerabilities.

- Security patching, including manual or managed updates provides flexibility to the Responsible Entity to determine how its Transient Cyber Asset(s) will be used. It is possible for an entity to have its Transient Cyber Asset be part of an enterprise patch process and receive security patches on a regular schedule or the entity can verify and apply security patches prior to connecting the Transient Cyber Asset to an applicable Cyber Asset. Unlike CIP-007, Requirement R2, there is no expectation of creating dated mitigation plans or other documentation other than what is necessary to identify that the Transient Cyber Asset is receiving appropriate security patches.
- Live operating system and software executable only from read-only media is provided to allow a protected operating system that cannot be modified to deliver malicious software. When entities are creating custom live operating systems, they should check the image during the build to ensure that there is not malicious software on the image.
- System hardening, also called operating system hardening, helps minimize security vulnerabilities by removing all non-essential software programs and utilities and only installing the bare necessities that the computer needs to function. While other programs may provide useful features, they can provide "back-door" access to the system, and should be removed to harden the system.
- When selecting to use other methods that mitigate software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet the software vulnerability mitigation objective.

Section 1.4: Entities are to document and implement their process(es) to mitigate malicious code through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. As with vulnerability management, there is diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in malicious code protections. When addressing malicious code protection, the Responsible Entity should address methods deployed to deter, detect, or prevent malicious code. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

- Antivirus software, including manual or managed updates of signatures or patterns, provides flexibility just as with security patching, to manage Transient Cyber Asset(s) by deploying antivirus or endpoint security tools that maintain a scheduled update of the signatures or patterns. Also, for devices that do not regularly connect to receive scheduled updates, entities may choose to scan the Transient Cyber Asset prior to connection to ensure no malicious software is present.
- Application whitelisting is a method of authorizing only the applications and processes that are necessary on the Transient Cyber Asset. This reduces the opportunity that malicious software could become resident, much less propagate, from the Transient Cyber Asset to the BES Cyber Asset or BES Cyber System.
- Restricted communication to limit the exchange of data to only the Transient Cyber Asset and the Cyber Assets to which it is connected by restricting or disabling serial or network (including wireless) communications on a managed Transient Cyber Asset can be used to minimize the opportunity to introduce malicious code onto the Transient Cyber Asset while it is not connected to BES Cyber Systems. This renders the device unable to communicate with devices other than the one to which it is connected.
- When selecting to use other methods that mitigate the introduction of malicious code to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the introduction of malicious code objective.

Section 1.5: Entities are to document and implement their process(es) to protect and evaluate Transient Cyber Assets to ensure they mitigate the risks that unauthorized use of the Transient Cyber Asset may present to the BES Cyber System. The concern addressed by this section is the possibility that the Transient Cyber Asset could be tampered with, or exposed to malware, while not in active use by an authorized person. Physical security of the Transient Cyber Asset is certainly a control that will mitigate this risk, but other tools and techniques are also available. The bulleted list of example protections provides some suggested alternatives.

- For restricted physical access, the intent is that the Transient Cyber Asset is maintained within a Physical Security Perimeter or other physical location or enclosure that uses physical access controls to protect the Transient Cyber Asset.
- Full disk encryption with authentication is an option that can be employed to protect a Transient Cyber Asset from unauthorized use. However, it is important that

authentication be required to decrypt the device. For example, pre-boot authentication, or power-on authentication, provides a secure, tamper-proof environment external to the operating system as a trusted authentication layer. Authentication prevents data from being read from the hard disk until the user has confirmed they have the correct password or other credentials. By performing the authentication prior to the system decrypting and booting, the risk that an unauthorized person may manipulate the Transient Cyber Asset is mitigated.

- Multi-factor authentication is used to ensure the identity of the person accessing the device. Multi-factor authentication also mitigates the risk that an unauthorized person may manipulate the Transient Cyber Asset.
- In addition to authentication and pure physical security methods, other alternatives are available that an entity may choose to employ. Certain theft recovery solutions can be used to locate the Transient Cyber Asset, detect access, remotely wipe, and lockout the system, thereby mitigating the potential threat from unauthorized use if the Transient Cyber Asset was later connected to a BES Cyber Asset. Other low tech solutions may also be effective to mitigate the risk of using a maliciously-manipulated Transient Cyber Asset, such as tamper evident tags or seals, and executing procedural controls to verify the integrity of the tamper evident tag or seal prior to use.
- When selecting to use other methods that mitigate the risk of unauthorized use to those listed, entities need to have documentation that identifies how the other method(s) meet the mitigation of the risk of unauthorized use objective.

Requirement R4, Attachment 1, Section 2 - Transient Cyber Asset(s) Managed by a Party Other than the Responsible Entity

The attachment also recognizes the lack of control for Transient Cyber Assets that are managed by parties other than the Responsible Entity. However, this does not obviate the Responsible Entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not manage. The requirements listed herein allow entities the ability to review the assets to the best of their capability and to meet their obligations.

To facilitate these controls, Responsible Entities may choose to execute agreements with other parties to provide support services to BES Cyber Systems and BES Cyber Assets that may involve the use of Transient Cyber Assets. Entities may consider using the Department of Energy Cybersecurity Procurement Language for Energy Delivery dated April 2014. [1] Procurement language may unify the other party and entity actions supporting the BES Cyber Systems and BES Cyber Assets. CIP program attributes may be considered including roles and responsibilities, access controls, monitoring, logging, vulnerability, and patch management along with incident response and back up recovery may be part of the other party's support.

[1] http://www.energy.gov/oe/downloads/cybersecurity-procurement-language-energy-delivery-april-2014

Entities should consider the "General Cybersecurity Procurement Language" and "The Supplier's Life Cycle Security Program" when drafting Master Service Agreements, Contracts, and the CIP program processes and controls.

Section 2.1: Entities are to document and implement their process(es) to mitigate software vulnerabilities through the use of one or more of the protective measures listed.

- Conduct a review of the Transient Cyber Asset managed by a party other than the Responsible Entity to determine whether the security patch level of the device is adequate to mitigate the risk of software vulnerabilities before connecting the Transient Cyber Asset to an applicable system.
- Conduct a review of the other party's security patching process. This can be done either at the time of contracting but no later than prior to connecting the Transient Cyber Asset to an applicable system. Just as with reviewing the security patch level of the device, selecting to use this approach aims to ensure that the Responsible Entity has mitigated the risk of software vulnerabilities to applicable systems.
- Conduct a review of other processes that the other party uses to mitigate the risk of software vulnerabilities. This can be reviewing system hardening, application whitelisting, virtual machines, etc.
- When selecting to use other methods to mitigate software vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet mitigation of the risk of software vulnerabilities.

Section 2.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more of the protective measures listed.

- Review the use of antivirus software and signature or pattern levels to ensure that the level is adequate to the Responsible Entity to mitigate the risk of malicious software being introduced to an applicable system.
- Review the antivirus or endpoint security processes of the other party to ensure that their processes are adequate to the Responsible Entity to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of application whitelisting used by the other party to mitigate the risk of introducing malicious software to an applicable system.
- Review the use of live operating systems or software executable only from read-only media to ensure that the media is free from malicious software itself. Entities should review the processes to build the read-only media as well as the media itself.
- Review system hardening practices used by the other party to ensure that unnecessary ports, services, applications, etc. have been disabled or removed. This will limit the chance of introducing malicious software to an applicable system.

Section 2.3: Determine whether additional mitigation actions are necessary, and implement such actions prior to connecting the Transient Cyber Asset managed by a party other than the Responsible Entity. The intent of this section is to ensure that after conducting the selected review from Sections 2.1 and 2.2, if there are deficiencies that do not meet the Responsible Entity's security posture, the other party is required to complete the mitigations prior to connecting their devices to an applicable system.

Requirement R4, Attachment 1, Section 3 - Removable Media

Entities have a high level of control for Removable Media that are going to be connected to their BES Cyber Assets.

Section 3.1: Entities are to document and implement their process(es) to authorize the use of Removable Media. The Removable Media may be listed individually or by type.

- Document the user(s), individually or by group/role, allowed to use the Removable Media. This can be done by listing a specific person, department, or job function. Authorization includes vendors and the entity's personnel. Caution: consider whether these user(s) must have authorized electronic access to the applicable system in accordance with CIP-004.
- Locations where the Removable Media may be used. This can be done by listing a specific location or a group/role of locations.

Section 3.2: Entities are to document and implement their process(es) to mitigate the introduction of malicious code through the use of one or more method(s) to detect malicious code on the Removable Media before it is connected to a BES Cyber Asset. When using the method(s) to detect malicious code, it is expected to occur from a system that is not part of the BES Cyber System to reduce the risk of propagating malicious code into the BES Cyber System network or onto one of the BES Cyber Assets. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident. Frequency and timing of the methods used to detect malicious code were intentionally excluded from the requirement because there are multiple timing scenarios that can be incorporated into a plan to mitigate the risk of malicious code. The entities must use the method(s) to detect malicious code on Removable Media before it is connected to the BES Cyber Asset. The timing dictated and documented in the entity's plan should reduce the risk of introducing malicious code to the BES Cyber Asset or Protected Cyber Asset.

As a method to detect malicious code, entities may choose to use Removable Media with on-board malicious code detection tools. For these tools, the Removable Media are still used in conjunction with a Cyber Asset to perform the detection. For Section 3.2.1, the Cyber Asset used to perform the malicious code detection must be outside of the BES Cyber System or Protected Cyber Asset.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:
The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

Rationale for Requirement R2:
The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

Rationale for Requirement R3:
The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.
The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

Rationale for R4:
Requirement R4 responds to the directive in FERC Order No. 791, at Paragraphs 6 and 136, to address security-related issues associated with Transient Cyber Assets and Removable Media used on a temporary basis for tasks such as data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To mitigate the risks associated with such tools, Requirement R4 was developed to accomplish the following security objectives:

- Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and
- Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.

Requirement R4 incorporates the concepts from other CIP requirements in CIP-010~~-2~~ and CIP-007~~-6~~ to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes: All requirements related to Transient Cyber Assets and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Description of Current Draft

This is the first draft of the proposed standard.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	October 19, 2016
SAR posted for comment	October 20 - November 21, 2016
45-day formal comment period with ballot	January 19 - March 6, 2017
45-day formal comment period with ballot	May 2 – June 15, 2017

Anticipated Actions	Date
10-day final ballot	July 2017
NERC Board (Board) adoption	August 2017

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): None

Upon Board adoption, the rationale boxes will be moved to the Supplemental Material Section.

A. Introduction

1. **Title:** **Cyber Security - Supply Chain Risk Management**

2. **Number:** **CIP-013-1**

3. **Purpose:** To mitigate cyber security risks to the reliable operation of the Bulk Electric System (BES) by implementing security controls for supply chain risk management of BES Cyber Systems.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.3. Generator Operator

   4.1.4. Generator Owner

   4.1.5. Reliability Coordinator

   4.1.6. Transmission Operator

   4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers

4.2.2.1. All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-013-1:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the identification and categorization process required by CIP-002-5, or any subsequent version of that Reliability Standard.

5. Effective Date: See Implementation Plan for Project 2016-03.

B. Requirements and Measures

Rationale for Requirement R1:
The proposed Requirement addresses Order No. 829 directives for entities to implement a plan(s) that includes processes for mitigating cyber security risks in the supply chain. The plan(s) is required to address the following four objectives (Order No. 829 at P. 45):

(1) Software integrity and authenticity;
(2) Vendor remote access;
(3) Information system planning; and
(4) Vendor risk management and procurement controls.

The cyber security risk management plan(s) specified in Requirement R1 apply to high and medium impact BES Cyber Systems.

Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders), consistent with Order No. 829 (P. 36).

Requirement R1 Part 1.1 addresses the directive in Order No. 829 for identification and documentation of cyber security risks in the planning and development processes related to the procurement of BES Cyber Systems (P. 56). The security objective is to ensure entities consider cyber security risks to the BES from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s); and options for mitigating these risks when planning for BES Cyber Systems.

Requirement R1 Part 1.2 addresses the directive in Order No. 829 for procurement controls to address the provision and verification of security concepts in future contracts for BES Cyber Systems (P. 59). The objective of Part 1.2 is for entities to include these topics in their plans so that procurement and contract negotiation processes address the applicable risks. Implementation of the entity's plan related to Part 1.2 may be accomplished through the entity's procurement and contract negotiation processes. For

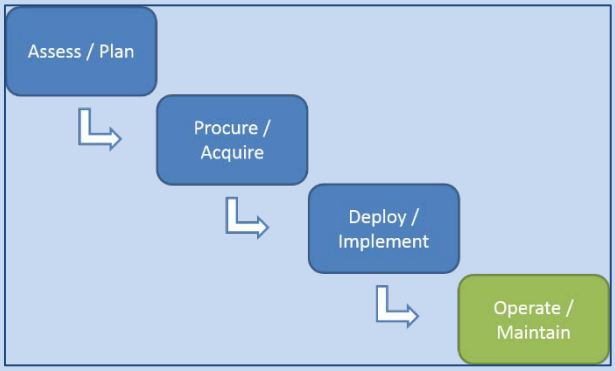
example, entities can implement the plan by including applicable procurement items from their plan in Requests for Proposals (RFPs), negotiations with vendors, or requests submitted to entities negotiating on behalf of the Responsible Entity such as in cooperative purchasing agreements. Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan. Although the expectation is that Responsible Entities would enforce the security-related provisions in the contract based on the terms and conditions of that contract, such contract enforcement and vendor performance or adherence to the negotiated contract is not subject to this Reliability Standard.

The objective of verifying software integrity and authenticity (Part 1.2.5) is to help ensure that software installed on BES Cyber Systems is not modified prior to installation without the awareness of the software supplier and is not counterfeit. Part 1.2.5 is not an operational requirement for entities to perform such verification; instead, it requires entities to address the software integrity and authenticity issue in its contracting process to provide the entity the means by which to perform such verification under CIP-010-3.

The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contract with to supply BES Cyber Systems and related services. It does not include other NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

Collectively, the provisions of CIP-013-1 address an entity's controls for managing cyber security risks to BES Cyber Systems during the planning, acquisition, and deployment phases of the system life cycle, as shown below.

Notional BES Cyber System Life Cycle



R1. Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber Systems. The plan(s) shall include: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. One or more process(es) used in planning for the procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the Bulk Electric System from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s).

1.2. One or more process(es) used in procuring BES Cyber Systems that address the following, as applicable:

1.2.1. Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

1.2.2. Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

1.2.3. Notification by vendors when remote or onsite access should no longer be granted to vendor representatives;

1.2.4. Disclosure by vendors of known vulnerabilities related to the products or services provided to the Responsible Entity;

1.2.5. Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System; and

1.2.6. Coordination of controls for (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s).

M1. Evidence shall include one or more documented supply chain cyber security risk management plan(s) as specified in the Requirement.

R2. Each Responsible Entity shall implement its supply chain cyber security risk management plan(s) specified in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

M2. Evidence shall include documentation to demonstrate implementation of the supply chain cyber security risk management plan(s), which could include, but is not limited

to, correspondence, policy documents, or working documents that demonstrate use of the supply chain cyber security risk management plan.

Rationale for Requirement R3:
The proposed requirement addresses Order No. 829 directives for entities to periodically reassess selected supply chain cyber security risk management controls (P. 46).

Entities perform periodic assessment to keep plans up-to-date and address current and emerging supply chain-related concerns and vulnerabilities. Examples of sources of information that the entity could consider include guidance or information issued by:

- NERC or the E-ISAC
- ICS-CERT
- Canadian Cyber Incident Response Centre (CCIRC)

Responsible Entities are not required to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders) when implementing an updated plan (i.e., the note in Requirement R2 applies to implementation of new plans and updated plans).

R3. Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Evidence shall include the dated supply chain cyber security risk management plan(s) approved by the CIP Senior Manager or delegate(s) and additional evidence to demonstrate review of the supply chain cyber security risk management plan(s). Evidence may include, but is not limited to, policy documents, revision history, records of review, or workflow evidence from a document management system that indicate review of supply chain risk management plan(s) at least once every 15 calendar months; and documented approval by the CIP Senior Manager or delegate.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s) which include the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2, but the plans do not include one of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s) which include the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2, but the plans do not include two or more of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s), but the plan(s) did not include the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, or the plan(s) did not include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s), but the plan(s) did not include the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and the plan(s) did not include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2. OR The Responsible Entity did not develop one or more documented supply chain cyber security risk management plan(s) as specified in the Requirement.

R2.	The Responsible Entity implemented its supply chain cyber security risk management plan(s) including the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Requirement R1 Part 1.1, and including the use of process(es) for procuring BES Cyber systems as specified in Requirement R1 Part 1.2, but did not implement one of the parts in Requirement R1 Part 1.2.1 through Part 1.2.6.	The Responsible Entity implemented its supply chain cyber security risk management plan(s) including the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Requirement R1 Part 1.1, and including the use of process(es) for procuring BES Cyber systems as specified in Requirement R1 Part 1.2, but did not implement two or more of the parts in Requirement R1 Part 1.2.1 through Part 1.2.6.	The Responsible Entity implemented its supply chain cyber security risk management plan(s), but did not implement the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Requirement R1 Part 1.1, or did not implement the use of process(es) for procuring BES Cyber systems as specified in Requirement R1 Part 1.2.	The Responsible Entity implemented its supply chain cyber security risk management plan(s), but did not implement the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Requirement R1 Part 1.1, and did not implement the use of process(es) for procuring BES Cyber systems as specified in Requirement R1 Part 1.2; OR The Responsible Entity did not implement its supply chain cyber security risk management plan(s) specified in the requirement.
R3.	The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did	The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did	The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did	The Responsible Entity did not review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) within

	so more than 15 calendar months but less than or equal to 16 calendar months since the previous review as specified in the Requirement.	so more than 16 calendar months but less than or equal to 17 calendar months since the previous review as specified in the Requirement.	so more than 17 calendar months but less than or equal to 18 calendar months since the previous review as specified in the Requirement.	18 calendar months of the previous review as specified in the Requirement.

Guidelines and Technical Basis

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT adoption, the text from the rationale text boxes was moved to this section.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Description of Current Draft

This is the first draft of the proposed standard.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	October 19, 2016
SAR posted for comment	October 20 - November 21, 2016
45-day formal comment period with ballot	January 19 - March 6, 2017
45-day formal comment period with ballot	May 2 – June 15, 2017

Anticipated Actions	Date
10-day final ballot	July 2017
NERC Board (Board) adoption	August 2017

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): None

Upon Board adoption, the rationale boxes will be moved to the Supplemental Material Section.

A. Introduction

1. **Title:** **Cyber Security - Supply Chain Risk Management**

2. **Number:** **CIP-013-1**

3. **Purpose:** To mitigate cyber security risks to the reliable operation of the Bulk Electric System (BES) by implementing security controls for supply chain risk management of BES Cyber Systems.

4. **Applicability:**

4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. Balancing Authority

4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Reliability Coordinator

4.1.6. Transmission Operator

4.1.7. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each RAS where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers

4.2.2.1. All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-013-1:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters (ESPs).

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the identification and categorization process required by CIP-002-5, or any subsequent version of that Reliability Standard.

5. Effective Date: See Implementation Plan for Project 2016-03.

B. Requirements and Measures

Rationale for Requirement R1:
The proposed Requirement addresses Order No. 829 directives for entities to implement a plan(s) that includes processes for mitigating cyber security risks in the supply chain. The plan(s) is required to address the following four objectives (Order No. 829 at P. 45):

(1) Software integrity and authenticity;
(2) Vendor remote access;
(3) Information system planning; and
(4) Vendor risk management and procurement controls.

The cyber security risk management plan(s) specified in Requirement R1 apply to high and medium impact BES Cyber Systems.

Implementation of the cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders), consistent with Order No. 829 (P. 36).

Requirement R1 Part 1.1 addresses the directive in Order No. 829 for identification and documentation of cyber security risks in the planning and development processes related to the procurement of BES Cyber Systems (P. 56). The security objective is to ensure entities consider cyber security risks to the BES from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s); and options for mitigating these risks when planning for BES Cyber Systems.

Requirement R1 Part 1.2 addresses the directive in Order No. 829 for procurement controls to address the provision and verification of security concepts in future contracts for BES Cyber Systems (P. 59). The objective of Part 1.2 is for entities to include these topics in their plans so that procurement and contract negotiation processes address the applicable risks. Implementation of ~~elements contained in~~ the entity's plan related to Part 1.2 may be accomplished through the entity's procurement and contract negotiation

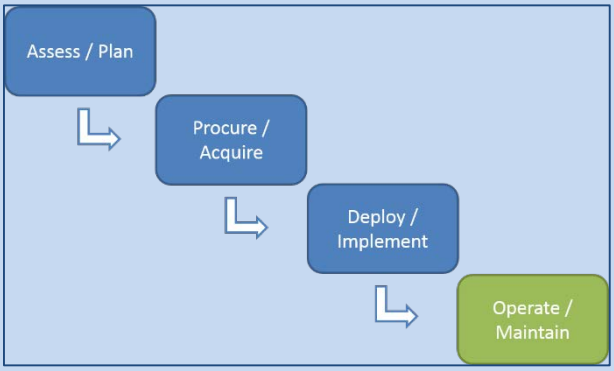
processes. For example, entities can implement the plan by including applicable procurement items from their plan in Requests for Proposals (RFPs), ~~and in~~ negotiations with vendors, or requests submitted to entities negotiating on behalf of the Responsible Entity such as in cooperative purchasing agreements. Obtaining specific controls in the negotiated contract may not be feasible and is not considered failure to implement an entity's plan. Although the expectation is that Responsible Entities would enforce the security-related provisions in the contract based on the terms and conditions of that contract, such contract enforcement and vendor performance or adherence to the negotiated contract is not subject to this Reliability Standard.

The objective of verifying software integrity and authenticity (Part 1.2.5) is to help ensure that software installed on BES Cyber Systems is not modified prior to installation without the awareness of the software supplier and is not counterfeit. Part 1.2.5 is not an operational requirement for entities to perform such verification; instead, it requires entities to address the software integrity and authenticity issue in its contracting process to provide the entity the means by which to perform such verification under CIP-010-3.

The term *vendor(s)* as used in the standard is limited to those persons, companies, or other organizations with whom the Responsible Entity, or its affiliates, contract with to supply BES Cyber Systems and related services. It does not include other NERC registered entities providing reliability services (e.g., Balancing Authority or Reliability Coordinator services pursuant to NERC Reliability Standards). A *vendor,* as used in the standard, may include: (i) developers or manufacturers of information systems, system components, or information system services; (ii) product resellers; or (iii) system integrators.

Collectively, the provisions of CIP-013-1 address an entity's controls for managing cyber security risks to BES Cyber Systems during the planning, acquisition, and deployment phases of the system life cycle, as shown below.

Notional BES Cyber System Life Cycle



R1. Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber Systems. The plan(s) shall include: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. One or more process(es) used in planning for the procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the Bulk Electric System from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s).

1.2. One or more process(es) used in procuring BES Cyber Systems that address the following, as applicable:

1.2.1. Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

1.2.2. Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;

1.2.3. Notification by vendors when remote or onsite access should no longer be granted to vendor representatives;

1.2.4. Disclosure by vendors of known vulnerabilities related to the products or services provided to the Responsible Entity;

1.2.5. Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System; and

1.2.6. Coordination of controls for (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s).

M1. Evidence shall include one or more documented supply chain cyber security risk management plan(s) as specified in the Requirement.

R2. Each Responsible Entity shall implement its supply chain cyber security risk management plan(s) specified in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

M2. Evidence shall include documentation to demonstrate implementation of the supply chain cyber security risk management plan(s), which could include, but is not limited to, correspondence, policy documents, or working documents that demonstrate use of the supply chain cyber security risk management plan.

Rationale for Requirement R3:
The proposed requirement addresses Order No. 829 directives for entities to periodically reassess selected supply chain cyber security risk management controls (P. 46).

Entities perform periodic assessment to keep plans up-to-date and address current and emerging supply chain-related concerns and vulnerabilities. Examples of sources of information that the entity could consider include guidance or information issued by:

- NERC or the E-ISAC
- ICS-CERT
- Canadian Cyber Incident Response Centre (CCIRC)

- Responsible Entities are not required to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders) when implementing an updated plan (i.e., the note in Requirement R2 applies to implementation of new plans and updated plans).

R3. Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Evidence shall include the dated supply chain cyber security risk management plan(s) approved by the CIP Senior Manager or delegate(s) and additional evidence to demonstrate review of the supply chain cyber security risk management plan(s). Evidence may include, but is not limited to, policy documents, revision history, records of review, or workflow evidence from a document management system that indicate review of supply chain risk management plan(s) at least once every 15 calendar months; and documented approval by the CIP Senior Manager or delegate.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s) which include the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2, but the plans do not include one of the ~~elements~~ parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s) which include the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2, but the plans do not include two or more of the ~~elements~~ parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s), but the plan(s) did not include the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, or the plan(s) did not include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s), but the plan(s) did not include the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and the plan(s) did not include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2. OR The Responsible Entity did not develop one or more documented supply chain cyber security risk management plan(s) as specified in the Requirement.

R2.	~~N/A~~ The Responsible Entity implemented its supply chain cyber security risk management plan(s) including the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Requirement R1 Part 1.1, and including the use of process(es) for procuring BES Cyber systems as specified in Requirement R1 Part 1.2, but did not implement one of the parts in Requirement R1 Part 1.2.1 through Part 1.2.6.	~~N/A~~ The Responsible Entity implemented its supply chain cyber security risk management plan(s) including the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Requirement R1 Part 1.1, and including the use of process(es) for procuring BES Cyber systems as specified in Requirement R1 Part 1.2, but did not implement two or more of the parts in Requirement R1 Part 1.2.1 through Part 1.2.6.	~~N/A~~ The Responsible Entity implemented its supply chain cyber security risk management plan(s), but did not implement the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Requirement R1 Part 1.1, or did not implement the use of process(es) for procuring BES Cyber systems as specified in Requirement R1 Part 1.2.	The Responsible Entity implemented its supply chain cyber security risk management plan(s), but did not implement the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Requirement R1 Part 1.1, and did not implement the use of process(es) for procuring BES Cyber systems as specified in Requirement R1 Part 1.2; OR The Responsible Entity did not implement its supply chain cyber security risk management plan(s) specified in the requirement.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Project 2016-03 Cyber Security Supply Chain Risk Management Reliability Standard

Applicable Standard(s)

CIP-005-6 — Cyber Security — Electronic Security Perimeters

CIP-010-3 — Configuration Change Management and Vulnerability Assessments

CIP-013-1 — Cyber Security — Supply Chain Risk Management

Requested Retirement(s)

CIP-005-5 — Cyber Security — Electronic Security Perimeters

CIP-010-2 — Configuration Change Management and Vulnerability Assessments

Prerequisite Standard(s)

None

Applicable Entities

- Balancing Authority
- Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:
  - Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:
  - Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and
  - Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.
  - Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.
  - Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.
- Generator Operator
- Generator Owner
- Reliability Coordinator

- Transmission Operator
- Transmission Owner

Reliability Standards CIP-005-6, CIP-010-3, and CIP-013-1 apply only to BES Cyber Systems categorized as high impact or medium impact according to the identification and categorization process required by CIP-002-5, or any subsequent version of that Reliability Standard.

Background

On July 21, 2016, the Federal Energy Regulatory Commission (FERC) issued Order No. 829 directing NERC to develop a new or modified Reliability Standard that addresses supply chain risk management for industrial control system hardware, software, and computing and networking services associated with Bulk Electric System (BES) operations. Order No. 829 (at P 2) states:

> [The Commission directs] NERC to develop a forward-looking, objective-based Reliability Standard to require each affected entity to develop and implement a plan that includes security controls for supply chain management for industrial control system hardware, software, and services associated with bulk electric system operations. The new or modified Reliability Standard should address the following security objectives, [discussed in detail in the Order]: (1) software integrity and authenticity; (2) vendor remote access; (3) information system planning; and (4) vendor risk management and procurement controls.

FERC directed NERC to submit the new or modified Reliability Standard(s) within one year of the effective date of Order No. 829, i.e., by September 27, 2017.

General Considerations

Consistent with the directive to develop a forward-looking Reliability Standard, the implementation of Reliability Standards in Project 2016-03 do not require the abrogation or re-negotiation of contracts (including amendments to master agreements and purchase orders) with vendors, suppliers or other entities executed as of the effective date of the proposed Reliability Standards (See FERC Order No. 829, P. 36).

In implementing CIP-013-1, responsible entities are expected to use their Supply Chain Cyber Security Risk Management Plans in procurement processes (e.g., Request for Proposal, requests to entities negotiating on behalf of the responsible entity in the case of cooperative purchase agreements, master agreements that the responsible entity negotiates after the effective date, or direct procurements covered under the responsible entity's plan) that begin on or after the effective date of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in a contract do not determine whether the procurement action is within scope of CIP-013-1.

Effective Date

For all Reliability Standards in Project 2016-03 — CIP-005-6, CIP-010-3, and CIP-013-1

Where approval by an applicable governmental authority is required, the Reliability Standard shall become effective on the first day of the first calendar quarter that is 18 months after the effective date of the applicable governmental authority's order approving the Reliability Standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the Reliability Standard shall become effective on the first day of the first calendar quarter that is 18 months after the date the Reliability Standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Initial Performance of Periodic Requirements

CIP-013-1 Requirement R3
The initial review and approval of supply chain cyber security risk management plans by CIP Senior Manager or Delegate pursuant to Requirement R3 must be completed on or before the effective date of CIP-013-1.

Planned or Unplanned Changes Resulting in a Higher Categorizaton

Compliance timelines with CIP-005-6, CIP-010-3, and CIP-013-1 for planned or unplanned changes in categorization are consistent with the Implementation Plan associated with Project 2008-06 Cyber Security Order 706 Version 5 CIP Standards.

Planned changes refer to any changes of the electric system or BES Cyber System as identified through the annual assessment under CIP-002-5 (or any subsequent version of that Reliability Standard) which were planned and implemented by the responsible entity.

For example, if an automation modernization activity is performed at a transmission substation, whereby Cyber Assets are installed that meet the criteria in CIP-002-5, Attachment 1, then the new BES Cyber System has been implemented as a result of a planned change.

In contrast, *unplanned* changes refer to any changes of the electric system or BES Cyber System, as identified through the annual assessment under CIP-002-5, Requirement R2, which were not planned by the responsible entity. Consider the scenario where a particular BES Cyber System at a transmission substation does not meet the criteria in CIP-002-5, Attachment 1, then, later, an action is performed outside of that particular transmission substation; such as, a transmission line is constructed or retired, a generation plant is modified, changing its rated output, and that unchanged BES Cyber System may become a medium impact BES Cyber System based on the CIP-002-5, Attachment 1, criteria.

For planned changes resulting in a higher categorization, the responsible entity shall comply with all applicable requirements in CIP-005-6, CIP-010-3, and CIP-013-1 on the update of the identification and categorization of the affected BES Cyber System.

For unplanned changes resulting in a higher categorization, the responsible entity shall comply with all applicable requirements in CIP-005-6, CIP-010-3, and CIP-013-1 according to the following timelines, following the identification and categorization of the affected BES Cyber System.

Scenario of Unplanned Changes After the Effective Date	Compliance Implementation
New high impact BES Cyber System	12 Months
New medium impact BES Cyber System	12 Months
Newly categorized high impact BES Cyber System from medium impact BES Cyber System	12 months for requirements not applicable to Medium-Impact BES Cyber Systems
Newly categorized medium impact BES Cyber System	12 Months
Responsible entity identifies first medium impact or high impact BES Cyber System (i.e., the responsible entity previously had no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes)	24 Months

Retirement Date

Standards listed in the **Requested Retirement(s)** section shall be retired immediately prior to the effective date in the particular jurisdiction in which the revised standards are becoming effective.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Project 2016-03 Cyber Security Supply Chain Risk Management Reliability Standard ~~CIP-013-1~~

Applicable Standard(s)

CIP-005-6 — Cyber Security — Electronic Security Perimeters

CIP-010-3 — Configuration Change Management and Vulnerability Assessments

CIP-013-1 — Cyber Security — Supply Chain Risk Management

Requested Retirement(s)

CIP-005-5 — Cyber Security — Electronic Security Perimeters

CIP-010-2 — Configuration Change Management and Vulnerability Assessments

Prerequisite Standard(s)

None

Applicable Entities

- Balancing Authority
- Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:
  - Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:
  - Is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and
  - Performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.
  - Each Remedial Action Scheme (RAS) where the RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.
  - Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.
- Generator Operator
- Generator Owner
- Reliability Coordinator

- Transmission Operator
- Transmission Owner

Reliability Standards CIP-005-6, CIP-010-3, and CIP-013-1 apply only to BES Cyber Systems categorized as high impact or medium impact according to the identification and categorization process required by CIP-002-5, or any subsequent version of that Reliability Standard.

Background

On July 21, 2016, the Federal Energy Regulatory Commission (FERC) issued Order No. 829 directing NERC to develop a new or modified Reliability Standard that addresses supply chain risk management for industrial control system hardware, software, and computing and networking services associated with Bulk Electric System (BES) operations. Order No. 829 (at P 2) states:

> [The Commission directs] NERC to develop a forward-looking, objective-based Reliability Standard to require each affected entity to develop and implement a plan that includes security controls for supply chain management for industrial control system hardware, software, and services associated with bulk electric system operations. The new or modified Reliability Standard should address the following security objectives, [discussed in detail in the Order]: (1) software integrity and authenticity; (2) vendor remote access; (3) information system planning; and (4) vendor risk management and procurement controls.

FERC directed NERC to submit the new or modified Reliability Standard(s) within one year of the effective date of Order No. 829, i.e., by September 27, 2017.

General Considerations

Consistent with the directive to develop a forward-looking Reliability Standard, the implementation of Reliability Standards in Project 2016-03 do not require the abrogation or re-negotiation of contracts (including amendments to master agreements and purchase orders) with vendors, suppliers or other entities executed as of the effective date of the proposed Reliability Standards (See FERC Order No. 829, P. 36).

In implementing CIP-013-1, responsible entities are expected to use their Supply Chain Cyber Security Risk Management Plans in procurement processes (e.g., Request for Proposal, ~~or~~ requests to entities negotiating on behalf of the responsible entity in the case of cooperative purchase agreements, master agreements that the responsible entity negotiates after the effective date, or direct procurements covered under the responsible entity's plan) that begin on or after the effective date of CIP-013-1. ~~Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1.~~ Contract effective date, commencement date, or other activation dates specified in ~~the~~ a contract do not determine whether the ~~contract is~~procurement action is within scope of CIP-013-1.

Effective Date

For all Reliability Standards in Project 2016-03 — CIP-005-6, CIP-010-3, and CIP-013-1
Where approval by an applicable governmental authority is required, the Reliability Standard shall become effective on the first day of the first calendar quarter that is 18 months after the effective date of the applicable governmental authority's order approving the Reliability Standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the Reliability Standard shall become effective on the first day of the first calendar quarter that is 18 months after the date the Reliability Standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Initial Performance of Periodic Requirements

CIP-013-1 Requirement R3
The initial review and approval of supply chain cyber security risk management plans by CIP Senior Manager or Delegate pursuant to Requirement R3 must be completed on or before the effective date of CIP-013-1.

Planned or Unplanned Changes Resulting in a Higher Categorizaton

Compliance timelines with CIP-005-6, CIP-010-3, and CIP-013-1 for planned or unplanned changes in categorization are consistent with the Implementation Plan associated with Project 2008-06 Cyber Security Order 706 Version 5 CIP Standards.

Planned changes refer to any changes of the electric system or BES Cyber System as identified through the annual assessment under CIP-002-5 (or any subsequent version of that Reliability Standard) which were planned and implemented by the responsible entity.

For example, if an automation modernization activity is performed at a transmission substation, whereby Cyber Assets are installed that meet the criteria in CIP-002-5, Attachment 1, then the new BES Cyber System has been implemented as a result of a planned change.

In contrast, *unplanned* changes refer to any changes of the electric system or BES Cyber System, as identified through the annual assessment under CIP-002-5, Requirement R2, which were not planned by the responsible entity. Consider the scenario where a particular BES Cyber System at a transmission substation does not meet the criteria in CIP-002-5, Attachment 1, then, later, an action is performed outside of that particular transmission substation; such as, a transmission line is constructed or retired, a generation plant is modified, changing its rated output, and that unchanged BES Cyber System may become a medium impact BES Cyber System based on the CIP-002-5, Attachment 1, criteria.

For planned changes resulting in a higher categorization, the responsible entity shall comply with all applicable requirements in CIP-005-6, CIP-010-3, and CIP-013-1 on the update of the identification and categorization of the affected BES Cyber System.

For unplanned changes resulting in a higher categorization, the responsible entity shall comply with all applicable requirements in CIP-005-6, CIP-010-3, and CIP-013-1 according to the following timelines, following the identification and categorization of the affected BES Cyber System.

Scenario of Unplanned Changes After the Effective Date	Compliance Implementation
New high impact BES Cyber System	12 Months
New medium impact BES Cyber System	12 Months
Newly categorized high impact BES Cyber System from medium impact BES Cyber System	12 months for requirements not applicable to Medium-Impact BES Cyber Systems
Newly categorized medium impact BES Cyber System	12 Months
Responsible entity identifies first medium impact or high impact BES Cyber System (i.e., the responsible entity previously had no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5 identification and categorization processes)	24 Months

~~**Definition**~~

~~None~~

Retirement Date

Standards listed in the **Requested Retirement(s)** section shall be retired immediately prior to the effective date in the particular jurisdiction in which the revised standards are becoming effective.

Violation Risk Factor and Violation Severity Level Justifications

Project 2016-03 — Cyber Security — Supply Chain Risk Management

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in **Project 2016-03 — Cyber Security — Supply Chain Risk Management.** Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined by the ERO Sanctions Guidelines. The Cyber Security Supply Chain Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications for CIP-013-01, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	R1 is a requirement in an Operations Planning time horizon to develop one or more documented supply chain cyber security risk management plan(s). If violated, it could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report**

VRF Justifications for CIP-013-01, R1	
Proposed VRF	**Medium**
	This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a new requirement addressing specific reliability goals.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R1 contains only one objective, which is to develop one or more documented supply chain cyber security risk management plan(s). Since the requirement has only one objective, only one VRF was assigned.

VSLs for CIP-013-1, R1			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s) which include the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2, but the plans do not include one of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s) which include the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2, but the plans do not include two or more of the parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s), but the plan(s) did not include the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, or the plan(s) did not include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s), but the plan(s) did not include the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and the plan(s) did not include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2. OR The Responsible Entity did not develop one or more documented supply chain cyber security risk management plan(s) as specified in the Requirement.

VSL Justifications for CIP-013-1, R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R1 is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

VSL Justifications for CIP-013-1, R1	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology. The VSL is assigned for a single instance of failing to develop one or more documented supply chain cyber security risk management plan(s) that set forth the controls.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	An entity's violation of a single part of the plan specified in the requirement does not constitute a lapse in protection that compromises network security. Therefore a binary VSL is not warranted.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	There is no documentation and implementation interdependence within the requirement.

VRF Justifications for CIP-013-1, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	R2 is a requirement in Operations Planning time horizon that requires entities to implement its supply chain cybersecurity risk management plan(s) specified in Requirement R1. If violated, failing to implement this plan could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a new requirement addressing specific reliability goals.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R2 contains only one objective and only one VRF was assigned. The requirement does not comingle more than one obligation.

VSLs for CIP-013-1, R2			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity implemented its supply chain cyber security risk management plan(s) including the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Requirement R1 Part 1.1, and including the use of process(es) for procuring BES Cyber systems as specified in Requirement R1 Part 1.2, but did not implement one of the parts in Requirement R1 Part 1.2.1 through Part 1.2.6.	The Responsible Entity implemented its supply chain cyber security risk management plan(s) including the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Requirement R1 Part 1.1, and including the use of process(es) for procuring BES Cyber systems as specified in Requirement R1 Part 1.2, but did not implement two or more of the parts in Requirement R1 Part 1.2.1 through Part 1.2.6.	The Responsible Entity implemented its supply chain cyber security risk management plan(s), but did not implement the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Requirement R1 Part 1.1, or did not implement the use of process(es) for procuring BES Cyber systems as specified in Requirement R1 Part 1.2.	The Responsible Entity implemented its supply chain cyber security risk management plan(s), but did not implement the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Requirement R1 Part 1.1, and did not implement the use of process(es) for procuring BES Cyber systems as specified in Requirement R1 Part 1.2; OR The Responsible Entity did not implement its supply chain cyber security risk management plan(s) as specified in the requirement.

VSL Justifications for CIP-013-1, R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R2 is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSL is based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	An entity's violation of a single part of the plan specified in the requirement does not constitute a lapse in protection that compromises network security. Therefore a binary VSL is not warranted.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	There is no documentation and implementation interdependence within the requirement.

VRF Justifications for CIP-013-1, R3	
Proposed VRF	**Medium**
NERC VRF Discussion	R3 is a requirement in Operations Planning time horizon that requires the Responsible Entity to periodically review and obtain CIP Senior Manager or delegate approval of supply chain cyber security risk management plans. The reliability objective is to ensure plans remain up to date and address current and emerging supply chain-related cyber security concerns and vulnerabilities. If the requirement is violated, it could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a new requirement addressing specific reliability goals.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R3 contains only one objective and only one VRF was assigned. The requirement does not comingle more than one obligation.

VSLs for CIP-013-1, R3			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did so more than 15 calendar months but less than or equal to 16 calendar months since the previous review as specified in the Requirement.	The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did so more than 16 calendar months but less than or equal to 17 calendar months since the previous review as specified in the Requirement.	The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did so more than 17 calendar months but less than or equal to 18 calendar months since the previous review as specified in the Requirement.	The Responsible Entity did not review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) within 18 calendar months of the previous review as specified in the Requirement.

VSL Justifications for CIP-013-1, R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R1 is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

VSL Justifications for CIP-013-1, R3	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	An entity's violation of the review requirement by some number of months less than 18 calendar months does not constitute a lapse in protection that compromises network security. Therefore a binary VSL is not warranted.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	There is no documentation and implementation interdependence within the requirement.

VRF Justifications for CIP-005-6, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	R2 is a requirement in an Operations Planning and Same Day Operations time horizon to implement one or more documented processes for controlling vendor remote access to high and medium impact BES Cyber Systems. If violated, it could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a revised requirement with the addition of two parts addressing specific reliability goals. The VRF of Medium is consistent with the approved version of the standard.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R2 contains only one objective and only one VRF was assigned. The requirement does not comingle more than one obligation.

VSLs for CIP-005-6, R2			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity does not have documented processes for one or more of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for one of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for two of the applicable items for Requirement Parts 2.1 through 2.3; OR The Responsible Entity did not have either: one or more method(s) for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) (2.4); or one or more methods to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access) (2.5)..	The Responsible Entity did not implement processes for three of the applicable items for Requirement Parts 2.1 through 2.3; OR The Responsible Entity did not have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) (2.4) and one or more methods to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access) (2.5).

VSL Justifications for CIP-005-6, R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering	Theaddition of Parts 2.4 and 2.5 does not lower the current level of compliance.

the Current Level of Compliance	
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment for R2 is not binary. Guideline 2b: The proposed VSLs do not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.

FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	An entity's violation of a single part of the requirement does not constitute a lapse in protection that compromises network security. Therefore a binary VSL is not warranted.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	There is no documentation and implementation interdependence within the requirement.

VRF Justifications for CIP-010-1, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	R1 is a requirement in Operations Planning time horizon that requires the Responsible Entity to implement one or more documented processes that include each of the applicable requirement parts for configuration change management. If violated, it could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report**

VRF Justifications for CIP-010-1, R1	
Proposed VRF	**Medium**
	This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a revised requirement with an additional part to address specific reliability goals. The VRF of Medium is consistent with the approved version of the standard.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R1 contains only one objective and only one VRF was assigned. The requirement does not comingle more than one obligation

			production environments (1.5.2); OR The Responsible Entity does not have a process as specified in Part 1.6 to verify the identity of the software source and the integrity of the software provided by the software source when the method to do so is available to the Responsible Entity from the software source. (1.6)

VSL Justifications for CIP-010-3, R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The addition of Part 1.6 does not lower the currentl level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment for R1 is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

VSL Justifications for CIP-010-3, R1	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	An entity's violation of a single part of the requirement does not constitute a lapse in protection that compromises network security. Therefore a binary VSL is not warranted.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	There is no documentation and implementation interdependence within the requirement.

Violation Risk Factor and Violation Severity Level Justifications

Project 2016-03 — Cyber Security — Supply Chain Risk Management

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in **Project 2016-03 — Cyber Security — Supply Chain Risk Management.** Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined by the ERO Sanctions Guidelines. The Cyber Security Supply Chain Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications for CIP-013-01, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	R1 is a requirement in an Operations Planning time horizon to develop one or more documented supply chain cyber security risk management plan(s). If violated, it could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report**

VRF Justifications for CIP-013-01, R1	
Proposed VRF	**Medium**
	This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a new requirement addressing specific reliability goals.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R1 contains only one objective, which is to ~~address an entity's controls for managing cyber security risks to BES Cyber Systems during the planning, acquisition, and deployment phases of the system life cycle~~develop one or more documented supply chain cyber security risk management plan(s). Since the requirement has only one objective, only one VRF was assigned.

VSLs for CIP-013-1, R1			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s) which include the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2, but the plans do not include one of the ~~elements~~ parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s) which include the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2, but the plans do not include two or more of the ~~elements~~ parts in Part 1.2.1 through Part 1.2.6.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s), but the plan(s) did not include the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, or the plan(s) did not include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2.	The Responsible Entity developed one or more documented supply chain cyber security risk management plan(s), but the plan(s) did not include the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Part 1.1, and the plan(s) did not include the use of process(es) for procuring BES Cyber systems as specified in Part 1.2. OR The Responsible Entity did not develop one or more documented supply chain cyber security risk management plan(s) as specified in the Requirement.

VSL Justifications for CIP-013-1, R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R1 is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

VSL Justifications for CIP-013-1, R1	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology. The VSL is assigned for a single instance of failing to develop one or more documented supply chain cyber security risk management plan(s) that set forth the controls.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	An entity's violation of a single part of the plan specified in the requirement does not constitute a lapse in protection that compromises network security. Therefore a binary VSL is not warranted.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	There is no documentation and implementation interdependence within the requirement.

VRF Justifications for CIP-013-1, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	R2 is a requirement in Operations Planning time horizon that requires entities to implement its supply chain cybersecurity risk management plan(s) specified in Requirement R1. If violated, failing to implement this plan could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a new requirement addressing specific reliability goals.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R2 contains only one objective and only one VRF was assigned. The requirement does not comingle more than one obligation.

VSLs for CIP-013-1, R2			
Lower	**Moderate**	**High**	**Severe**
~~N/A~~ The Responsible Entity implemented its supply chain cyber security risk management plan(s) including the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Requirement R1 Part 1.1, and including the use of process(es) for procuring BES Cyber systems as specified in Requirement R1 Part 1.2, but did not implement one of the parts in Requirement R1 Part 1.2.1 through Part 1.2.6.	~~N/A~~ The Responsible Entity implemented its supply chain cyber security risk management plan(s) including the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Requirement R1 Part 1.1, and including the use of process(es) for procuring BES Cyber systems as specified in Requirement R1 Part 1.2, but did not implement two or more of the parts in Requirement R1 Part 1.2.1 through Part 1.2.6.	~~N/A~~ The Responsible Entity implemented its supply chain cyber security risk management plan(s), but did not implement the use of process(es) in planning for procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the BES as specified in Requirement R1 Part 1.1, or did not implement the use of process(es) for procuring BES Cyber systems as specified in Requirement R1 Part 1.2. VSL Justifications for CIP-013-1, R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R2 is not binary. ~~The VSL assignment for R2 is SEVERE which is consistent with binary criteria.~~ Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSL is based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	An entity's violation of a single part of the plan specified in the requirement does not constitute a lapse in protection that compromises network security. Therefore a binary VSL is not warranted.~~A single VSL of Severe is assigned.~~
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	There is no documentation and implementation interdependence within the requirement.

VRF Justifications for CIP-013-1, R3	
Proposed VRF	**Medium**
NERC VRF Discussion	R3 is a requirement in Operations Planning time horizon that requires the Responsible Entity to periodically review and obtain CIP Senior Manager or delegate approval of supply chain cyber security risk management plans. The reliability objective is to ensure plans remain up to date and address current and emerging supply chain-related cyber security concerns and vulnerabilities. If the requirement is violated, it could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a new requirement addressing specific reliability goals.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R3 contains only one objective and only one VRF was assigned. The requirement does not comingle more than one obligation.

VSLs for CIP-013-1, R3			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did so more than 15 calendar months but less than or equal to 16 calendar months since the previous review as specified in the Requirement.	The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did so more than 16 calendar months but less than or equal to 17 calendar months since the previous review as specified in the Requirement.	The Responsible Entity reviewed and obtained CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) but did so more than 17 calendar months but less than or equal to 18 calendar months since the previous review as specified in the Requirement.	The Responsible Entity did not review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) within 18 calendar months of the previous review as specified in the Requirement.

VSL Justifications for CIP-013-1, R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R1 is not binary. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

VSL Justifications for CIP-013-1, R3	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	An entity's violation of the review requirement by some number of months less than 18 calendar months does not constitute a lapse in protection that compromises network security. Therefore a binary VSL is not warranted.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	There is no documentation and implementation interdependence within the requirement.

VRF Justifications for CIP-005-6, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	R2 is a requirement in an Operations Planning and Same Day Operations time horizon to implement one or more documented processes for controlling vendor remote access to high and medium impact BES Cyber Systems. If violated, it could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a revised requirement with the addition of two parts addressing specific reliability goals. The VRF of Medium is consistent with the approved version of the standard.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R2 contains only one objective and only one VRF was assigned. The requirement does not comingle more than one obligation.

VSLs for CIP-005-6, R2			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity does not have documented processes for one or more of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for one of the applicable items for Requirement Parts 2.1 through 2.3.	The Responsible Entity did not implement processes for two of the applicable items for Requirement Parts 2.1 through 2.3; OR The Responsible Entity did not have either: one or more method(s) for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) (2.4); or one or more methods to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access) (2.5)..	The Responsible Entity did not implement processes for three of the applicable items for Requirement Parts 2.1 through 2.3; OR The Responsible Entity did not have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) (2.4) and one or more methods to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access) (2.5).

VSL Justifications for CIP-005-6, R2

VRF Justifications for CIP-010-1, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	R1 is a requirement in Operations Planning time horizon that requires the Responsible Entity to implement one or more documented processes that include each of the applicable requirement parts for configuration change management. If violated, it could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report**

VRF Justifications for CIP-010-1, R1	
Proposed VRF	**Medium**
	This requirement does not address any of the critical areas identified in the Final Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has no sub-requirements and is assigned a single VRF.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This is a revised requirement with an additional part to address specific reliability goals. The VRF of Medium is consistent with the approved version of the standard.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** A VRF of Medium is consistent with the NERC VRF definition as discussed above.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R1 contains only one objective and only one VRF was assigned. The requirement does not comingle more than one obligation

Table of Contents

Introduction

On July 21, 2016, the Federal Energy Regulatory Commission (FERC) issued Order No. 829 directing the North American Electric Reliability Corporation (NERC) to develop a new or modified Reliability Standard that addresses cyber security supply chain risk management for industrial control system hardware, software, and computing and networking services associated with Bulk Electric System (BES) operations as follows:

> [The Commission directs] NERC to develop a forward-looking, objective-based Reliability Standard to require each affected entity to develop and implement a plan that includes security controls for supply chain management for industrial control system hardware, software, and services associated with bulk electric system operations. The new or modified Reliability Standard should address the following security objectives, [discussed in detail in the Order]: (1) software integrity and authenticity; (2) vendor remote access; (3) information system planning; and (4) vendor risk management and procurement controls.

Reliability Standard **CIP-013-1 – Cyber Security – Supply Chain Risk Management** addresses the relevant cyber security supply chain risks in the planning, acquisition, and deployment phases of the system life cycle for high and medium impact BES Cyber Systems[1].

This implementation guidance provides considerations for implementing the requirements in CIP-013-1 and examples of approaches that responsible entities could use to meet the requirements. The examples do not constitute the only approach to complying with CIP-013-1. Responsible Entities may choose alternative approaches that better fit their situation.

[1] Responsible Entities identify high and medium impact BES Cyber Systems according to the identification and categorization process required by CIP-002-5, or subsequent version of that standard.

Requirement R1

R1. *Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber Systems. The plan(s) shall include:*

1.1. *One or more process(es) used in planning for the procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the Bulk Electric System from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s).*

1.2. *One or more process(es) used in procuring BES Cyber Systems that address the following, as applicable:*

1.2.1. *Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;*

1.2.2. *Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;*

1.2.3. *Notification by vendors when remote or onsite access should no longer be granted to vendor representatives;*

1.2.4. *Disclosure by vendors of known vulnerabilities;*

1.2.5. *Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System; and*

1.2.6. *Coordination of controls for (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s).*

General Considerations for R1

The following are some general considerations for Responsible Entities as they implement Requirement R1:

First, in developing their supply chain cyber security risk management plan(s), Responsible entities should consider how to leverage the various components and phases of their processes (e.g. defined requirements, request for proposal, bid evaluation, external vendor assessment tools and data, third party certifications and audit reports, etc.) to help them meet the objective of Requirement R1 and give them flexibility to negotiate contracts with vendors to efficiently mitigate risks. Focusing solely on the negotiation of specific contract terms could have unintended consequences, including significant and unexpected cost increases for the product or service or vendors refusing to enter into contracts.

Additionally, a Responsible Entity may not have the ability to obtain each of its desired cyber security controls in its contract with each of its vendors. Factors such as competition, limited supply sources, expense, criticality of the product or service, and maturity of the vendor or product line could affect the terms and conditions ultimately negotiated by the parties and included in a contract. This variation in contract terms is anticipated and, in turn, the note in Requirement R2 provides that the actual terms and conditions of the contract are outside the scope of Reliability Standard CIP-013-1.

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the

following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

The focus of Requirement R1 is on the steps the Responsibility Entity takes to consider cyber security risks from vendor products or services during BES Cyber System planning and procurement. In the event the vendor is unwilling to engage in the negotiation process for cyber security controls, the Responsible Entity could explore other sources of supply or mitigating controls to reduce the risk to the BES cyber systems, as the Responsible Entity's circumstances allow.

In developing and implementing its supply chain cyber security risk management plan, a Responsible Entity may consider identifying and prioritizing security controls based on the cyber security risks presented by the vendor and the criticality of the product or service to reliable operations. For instance, Responsible Entities may establish a baseline set of controls for given products or services that a vendor must meet prior to transacting with that vendor for those products and services (i.e., "must-have controls"). As risks differ between products and services, the baseline security controls – or "must haves" – may differ for the various products and services the Responsible Entities procures for its BES Cyber Systems. This risk-based approach could help create efficiencies in the Responsible Entity's procurement processes while meeting the security objectives of Requirement R1.

The objective of addressing the verification of software integrity and authenticity during the procurement phase of BES Cyber System(s) (Part 1.2.5) is to identify the capability of the vendor(s) to ensure that the software installed on BES Cyber System(s) is trustworthy. Part 1.2.5 is not an operational requirement for Responsible Entities to perform the verification; instead, Part 1.2.5 is aimed at identifying during the procurement phase the vendor's capability to provide software integrity and authenticity assurance and establish vendor performance based on the vendor's capability in order to implement CIP-010-3, Requirement R1, Part 1.6.

Implementation Guidance for R1

Responsible entities use various processes as they plan to procure BES Cyber Systems. Below are some examples of approaches to comply with this requirement:

R1. *Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber Systems. The plan(s) shall include:*

- The Responsible Entity could establish one or more documents explaining the process by which the Responsible Entity will address supply chain cyber security risk management for high and medium impact BES Cyber Systems. To achieve the flexibility needed for supply chain cyber security risk management, Responsible Entities can use a "risk-based approach". One element of, or approach to, a risk-based cyber security risk management plan is **system-based**, focusing on specific controls for high and medium impact BES Cyber Systems to address the risks presented in procuring those systems or services for those systems. A risk-based approach could also be **vendor-based**, focusing on the risks posed by various vendors of its BES Cyber Systems. Entities may combine both of these approaches into their plans. This flexibility is important to account for the varying "needs and characteristics of responsible entities and the diversity of BES Cyber System environments, technologies, and risk (FERC Order No. 829 P 44)."

1.1. *One or more process(es) used in planning for the procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the Bulk Electric System from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s).*

A Responsible Entity could document in its supply chain cyber security risk management plan one or more processes that it will use when planning for the procurement of BES Cyber Systems to identify and assess cyber security risks to the Bulk Electric System from vendor products or services as specified in the requirement. Examples of processes, or outcomes of these processes, for complying with Part 1.1 are described below. A Responsible Entity could comply with Part 1.1 using either the first (team review) approach, or the second (risk assessment process) approach, a combination of the two approaches, or another approach determined by the Responsible Entity to comply with Part 1.1.

- A Responsible Entity can develop a process to form a team of subject matter experts from across the organization to participate in the BES Cyber System planning and acquisition process(es). The Responsible Entity should consider the relevant subject matter expertise necessary to meet the objective of Part 1.1 and include the appropriate representation of business operations, security architecture, information communications and technology, supply chain, compliance, and legal. Examples of factors that this team could consider in planning for the procurement of BES Cyber Systems as specified in Part 1.1 include:
  - Cyber security risk(s) to the BES that could be introduced by a vendor in new or planned modifications to BES Cyber Systems.
  - Vendor security processes and related procedures, including: system architecture, change control processes, remote access requirements, and security notification processes.
  - Periodic review processes that can be used with critical vendor(s) to review and assess any changes in vendor's security controls, product lifecycle management, supply chain, and roadmap to identify opportunities for continuous improvement.
  - Vendor use of third party (e.g., product/personnel certification processes) or independent review methods to verify product and/or service security practices.
  - Third-party security assessments or penetration testing provided by the vendors.
  - Vendor supply chain channels and plans to mitigate potential risks or disruptions.
  - Known system vulnerabilities; known threat techniques, tactics, and procedures; and related mitigation measures that could be introduced by vendor's information systems, components, or information system services.
  - Corporate governance and approval processes.
  - Methods to minimize network exposure, e.g., prevent internet accessibility, use of firewalls, and use of secure remote access techniques.
  - Methods to limit and/or control remote access from vendors to Responsible Entity's BES Cyber Systems.
  - Vendor's risk assessments and mitigation measures for cyber security during the planning and procurement process.
  - Mitigating controls that can be implemented by the Responsible Entity of the vendor. Examples include hardening the information system, minimizing the attack surface, ensuring ongoing support for system components, identification of alternate sources for critical components, etc.
- A Responsible Entity can develop a risk assessment process to identify and assess potential cyber security risks resulting from (i) procuring and installing vendor equipment and software and (ii) transitions from one vendor(s) to another vendor(s). This process could consider the following:
  - Potential risks based on the vendor's information systems, system components, and/or information system services / integrators. Examples of considerations include:

- Critical systems, components, or services that impact the operations or reliability of BES Cyber Systems.
- Product components that are not owned and managed by the vendor that may introduce additional risks, such as open source code or components from third party developers and manufacturers.

- Potential risks based on the vendor's risk management controls. Examples of vendor risk management controls to consider include[2]:
  - Personnel background and screening practices by vendors.
  - Training programs and assessments of vendor personnel on cyber security.
  - Formal vendor security programs which include their technical, organizational, and security management practices.
  - Vendor's physical and cyber security access controls to protect the facilities and product lifecycle.
  - Vendor's security engineering principles in (i) developing layered protections; (ii) establishing sound security policy, architecture, and controls as the foundation for design; (iii) incorporating security requirements into the system development lifecycle; (iv) delineating physical and logical security boundaries; (v) ensuring that system developers are training on how to build security software; (vi) tailoring security controls to meet organizational and operational needs; (vii) performing threat modeling to identify use cases, threat agents, attack vectors, and attack patterns as well as compensating controls and design patterns needed to mitigate risk; and (viii) reducing risk to acceptable levels, thus enabling informed risk management decisions. (NIST SP 800-53 SA-8 – Security Engineering Principles).
  - System Development Life Cycle program (SDLC) methodology from design through patch management to understand how cyber security is incorporated throughout the vendor's processes.
  - Vendor certifications and their alignment with recognized industry and regulatory controls.
  - Summary of any internal or independent cyber security testing performed on the vendor products to ensure secure and reliable operations.[3]
  - Vendor product roadmap describing vendor support of software patches, firmware updates, replacement parts and ongoing maintenance support.
  - Identify processes and controls for ongoing management of Responsible Entity and vendor's intellectual property ownership and responsibilities, if applicable. Examples include use of encryption algorithms for securing software code, data and information, designs, and proprietary processes while at rest or in transit.
- Based on risk assessment, identify mitigating controls that can be implemented by the Responsible Entity or the vendor. Examples include hardening the information system, minimizing the attack surface, ensuring ongoing support for system components, identification of alternate sources for critical components, etc.

[2] Tools such as the Standardized Information Gathering (SIG) Questionnaire from the Shared Assessments Program can aid in assessing vendor risk.

[3] For example, a Responsible Entity can request that the vendor provide a Standards for Attestation Engagements (SSAE) No. 18 SOC 2 audit report.

1.2. *One or more process(es) used in procuring BES Cyber Systems that address the following, as applicable:*

A Responsible Entity could document in its supply chain cyber security risk management plan one or more processes that it will use when procuring BES Cyber Systems to address Parts 1.2.1 through 1.2.6. The following are examples of processes, or outcomes of these processes, for complying with Part 1.2.

- Request cyber security terms relevant to applicable Parts 1.2.1 through 1.2.6 in the procurement process (request for proposal (RFP) or contract negotiation) for BES Cyber Systems to ensure that vendors understand the cyber security expectations for implementing proper security controls throughout the design, development, testing, manufacturing, delivery, installation, support, and disposition of the product lifecycle[4].
- During negotiations of procurement contracts or processes with vendors, the Responsible Entity can document the rationale, mitigating controls, or acceptance of deviations from the Responsible Entity's standard cyber security procurement language that is applicable to the vendor's system component, system integrators, or external service providers.

Examples of ways that a Responsible Entity could, through process(es) for procuring BES Cyber Systems required by Part 1.2, comply with Parts 1.2.1 through 1.2.6 are described below.

1.2.1. *Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;*

- In an RFP or during contract negotiations, request that the vendor include in the contract provisions an obligation for the vendor to provide notification of any identified, threatened, attempted or successful breach of vendor's components, software or systems (*e.g.,* "security event") that have potential adverse impacts to the availability or reliability of BES Cyber Systems. Security event notifications to the Responsible Entity should be sent to designated point of contact as determined by the Responsible Entity and vendor. Examples of information to request that vendor's include in notifications to the Responsible Entity are(i) mitigating controls that the Responsible Entity can implement, if applicable (ii) availability of patch or corrective components, if applicable.

1.2.2. *Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity;*

- A Responsible Entity and vendor can agree on service level agreements for response to cyber security incidents and commitment from vendor to collaborate with the Responsible Entity in implement mitigating controls and product corrections.
- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor such that, in the event the vendor identifies a vulnerability that has resulted

[4] An example set of baseline supply chain cyber security procurement language for use by BES owners, operators, and vendors during the procurement process can be obtained from the "Cybersecurity Procurement Language for Energy Delivery Systems" developed by the Energy Sector Control Systems Working Group (ESCSWG).

in a cyber security incident related to the products or services provided to the Responsible Entity, the vendor should provide notification to Responsible Entity. The contract could specify that the vendor provide defined information regarding the products or services at risk and appropriate precautions available to minimize risks. Until the cyber security incident has been corrected, the vendor could be requested to perform analysis of information available or obtainable, provide an action plan, provide ongoing status reports, mitigating controls, and final resolution within reasonable periods as agreed on by vendor and Responsible Entity.

1.2.3. *1.2.3. Notification by vendors when remote or onsite access should no longer be granted to vendor representatives;*

- In an RFP or during contract negotiations, request that the vendor include in the contract provisions an obligation for the vendor to provide notification to the Responsible Entity when vendor employee remote or onsite access should no longer be granted. This does not require the vendor to share sensitive information about vendor employees. Circumstances for no longer granting access to vendor employees include: (i) vendor determines that any of the persons permitted access is no longer required, (ii) persons permitted access are no longer qualified to maintain access, or (iii) vendor's employment of any of the persons permitted access is terminated for any reason. Request vendor cooperation in obtaining Responsible Entity notification within a negotiated period of time of such determination. The vendor and Responsible Entity should define alternative methods that will be implemented in order to continue ongoing operations or services as needed.
- If vendor utilizes third parties (or subcontractors) to perform services to Responsible Entity, require vendors to obtain Responsible Entity's prior approval and require third party's adherence to the requirements and access termination rights imposed on the vendor directly.

1.2.4. *Disclosure by vendors of known vulnerabilities;*

- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor for cooperation in obtaining access to summary documentation within a negotiated period of any identified security breaches involving the procured product or its supply chain that impact the availability or reliability of the Responsible Entity's BES Cyber System. Documentation should include a summary description of the breach, its potential security impact, its root cause, and recommended corrective actions involving the procured product.
- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor for cooperation in obtaining, within a negotiated time period after establishing appropriate confidentiality agreement, access to summary documentation of uncorrected security vulnerabilities in the procured product that have not been publicly disclosed. The summary documentation should include a description of each vulnerability and its potential impact, root cause, and recommended compensating security controls, mitigations, and/or procedural workarounds.
- During procurement, review with the vendor summary documentation of publicly disclosed vulnerabilities in the product being procured and the status of the vendor's disposition of those publicly disclosed vulnerabilities.

1.2.5. *Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System; and*

- During procurement, request access to vendor documentation detailing the vendor patch management program and update process for all system components being procured (including third-party hardware, software, and firmware). This documentation should include the vendor's method or recommendation for how the integrity of the patch is validated by Responsible Entity. Ask vendors to describe the processes they use for delivering software and the methods that can be used to verify the integrity and authenticity of the software upon receipt, including systems with preinstalled software.
- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor to provide access to vendor documentation for the procured products (including third-party hardware, software, firmware, and services) regarding the release schedule and availability of updates and patches that should be considered or applied. Documentation should include instructions for securely applying, validating and testing the updates and patches.
- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor to provide appropriate software and firmware updates to remediate newly discovered vulnerabilities or weaknesses within a reasonable period for duration of the product life cycle. Consideration regarding service level agreements for updates and patches to remediate critical vulnerabilities should be a shorter period than other updates. If updates cannot be made available by the vendor within a reasonable period, the vendor should be required to provide mitigations and/or workarounds.
- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor to provide fingerprints or cipher hashes for all software so that the Responsible Entity can verify the values prior to installation on the BES Cyber System to verify the integrity of the software.
- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor such that when third-party software components are provided by the vendor, the vendors provide appropriate updates and patches to remediate newly discovered vulnerabilities or weaknesses of the third-party software components.

1.2.6. *Coordination of controls for (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s).*

- During procurement, request vendors specify specific IP addresses, ports, and minimum privileges required to perform remote access services.
- Request vendors use individual user accounts that can be configured to limit access and permissions.
- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor to maintain their IT assets (hardware, software and firmware) connecting to Responsible Entity network with current updates to remediate security vulnerabilities or weaknesses identified by the original OEM or Responsible Entity.
- During procurement, request vendors document their processes for restricting connections from unauthorized personnel. Vendor personnel are not authorized to disclose or share account credentials, passwords or established connections.
- In an RFP or during contract negotiations, request that the vendor include in contract provisions a commitment from the vendor such that for vendor system-to-system connections that may limit the Responsible Entity's capability to authenticate the personnel connecting from the vendor's systems, the vendor will maintain complete and accurate books, user logs, access credential data, records, and other information applicable to connection access activities for a negotiated time period.

Requirement R2

R2. *Each Responsible Entity shall implement its supply chain cyber security risk management plan(s) specified in Requirement R1.*

Note: Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.

General Considerations for R2

Implementation of the supply chain cyber security risk management plan(s) does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders), consistent with Order No. 829 (P. 36). Contracts entering the Responsible Entity's procurement process (e.g. through Request for Proposals) on or after the effective date are within scope of CIP-013-1. Contract effective date, commencement date, or other activation dates specified in the contract do not determine whether the contract is within scope of CIP-013-1.

Requirement R3

R3. *Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months.*

General Considerations for R3

In the Requirement R3 review, responsible entities should consider new risks and available mitigation measures, which could come from a variety of sources that include NERC, DHS, and other sources.

Implementation Guidance for R3

Responsible entities use various processes to address this requirement. Below are some examples of approaches to comply with this requirement:

- A team of subject matter experts from across the organization representing appropriate business operations, security architecture, information communications and technology, supply chain, compliance, legal, etc. reviews the supply chain cyber security risk management plan at least once every 15 calendar months to reassess for any changes needed. Sources of information for changes include, but are not limited to:
  - Requirements or guidelines from regulatory agencies
  - Industry best practices and guidance that improve supply chain cyber security risk management controls (e.g. NERC, DOE, DHS, ICS-CERT, Canadian Cyber Incident Response Center (CCIRC), and NIST).
  - Mitigating controls to address new and emerging supply chain-related cyber security concerns and vulnerabilities
  - Internal organizational continuous improvement feedback regarding identified deficiencies, opportunities for improvement, and lessons learned.
- The CIP Senior Manager, or approved delegate, reviews any changes to the supply chain cyber security risk management plan at least once every 15 calendar months. Reviews may be more frequent based on the timing and scope of changes to the supply chain cyber security risk management plan(s). Upon approval of changes to the supply chain cyber security risk management plan(s), the CIP Senior Manager or approved delegate should provide appropriate communications to the affected organizations or individuals. Additionally, communications or training material may be developed to ensure any organizational areas affected by revisions are informed.

Order No. 829 Citation	Directive / Guidance	Resolution
P 43	[the Commission directs] that NERC, pursuant to section 215(d)(5) of the FPA, develop a forward-looking, objective-driven new or modified Reliability Standard to require each affected entity to develop and implement a plan that includes security controls for supply chain management for industrial control system hardware, software, and services associated with bulk electric system operations.	Proposed CIP-013-1 addresses the directive. The purpose of the proposed standard is: *To mitigate cyber security risks to the reliable operation of the Bulk Electric System (BES) by implementing security controls for supply chain risk management of BES Cyber Systems.* The SDT believes prioritizing high and medium impact BES Cyber Systems in the supply chain cyber security risk management standards is an appropriate approach to meeting the directives in FERC Order No. 829 and focuses industry resources on protecting the most impactful BES Cyber Systems. The proposed standards address directives requiring plans, processes, and controls for supply chain cyber security risk management for "industrial control system hardware, software, and services associated with bulk electric system operations". High and medium impact BES Cyber Systems, as categorized in CIP-002-5, generally describe assets that are critical to interconnected operations including transmission operations, reliability coordination, and balancing functions. The proposed requirements prioritize these cyber systems by specifying mandatory requirements, while entities retain flexibility for determining appropriate steps for addressing supply chain cyber security risks for low impact BES Cyber Systems. The approach provides an opportunity for industry to take measured steps to addressing complex supply chain cyber security risks using an established prioritization mechanism. The reliability benefit of a measured and prioritized approach is that it is more manageable for responsible entities to focus the

Order No. 829 Citation	Directive / Guidance	Resolution
		development of their plans, processes, and controls on the smaller subset of cyber assets that includes the most significant cyber assets. Additionally, the SDT anticipates that the proposed standards may provide some risk mitigation for low impact BES Cyber Systems even though the requirements do not specifically apply to low impact BES Cyber Systems. One way that reliability benefits may be extended to low-impact BES Cyber Systems through the approval of CIP-013-1 is by responsible entities that own all three classifications of cyber assets (high, medium, and low). These entities may use some or all of the processes in their cyber security risk management plans that meet the CIP-013-1 requirements to plan and procure cyber assets that are used in low impact BES Cyber Systems. Another potential way that the reliability benefits may be extended to low impact BES Cyber Systems is through vendor adoption of CIP-013-1 related security controls that the vendor voluntarily includes in low impact BES Cyber System contracts with responsible entities.
P 44	[the Commission directs] NERC to submit the new or modified Reliability Standard within one year of the effective date of this Final Rule. NERC should submit an informational filing [by December 26, 2016] with a plan to address the Commission's directive.	The proposed/modified standard(s) must be filed by September 27, 2017. NERC filed its plan to address the directive on December 15, 2016.
P 45	The plan required by the new or modified Reliability Standard developed by NERC should address, at a minimum, the following four specific security objectives in the context of addressing supply chain management risks: (1) software integrity and authenticity; (2) vendor remote access; (3) information system planning; and (4) vendor risk management and procurement controls. Responsible entities should be required to achieve	The directive is addressed by Requirements R1, R2, and R3 of proposed CIP-013-1. Requirement R1 specifies that entities must develop, and Requirement R2 specifies that entities must implement, one or more documented supply chain cyber security risk

Order No. 829 Citation	Directive / Guidance	Resolution
	these four objectives but have the flexibility as to how to reach the objective (i.e., the Reliability Standard should set goals (the "what"), while allowing flexibility in how a responsible entity subject to the Reliability Standard achieves that goal (the "how")).	management plan(s) for high and medium impact BES Cyber Systems that include one or more process(es) for mitigating cyber security risks to BES Cyber Systems. The plans address the four objectives from Order No. 829 (P 45) during the planning, acquisition, and deployment phases of the system life cycle. **Proposed CIP-013-1 Requirement R1** **R1.** Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber Systems. The plan(s) shall include: **1.1.** One or more process(es) used in planning for the procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the Bulk Electric System from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s). **1.2.** One or more process(es) used in procuring BES Cyber Systems that address the following, as applicable: **1.2.1.** Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity; **1.2.2.** Coordination of responses to vendor-identified incidents related to the products or services provided to the

Order No. 829 Citation	Directive / Guidance	Resolution
		Responsible Entity that pose cyber security risk to the Responsible Entity; **1.2.3.** Notification by vendors when remote or onsite access should no longer be granted to vendor representatives; **1.2.4.** Disclosure by vendors of known vulnerabilities related to the products or services provided to the Responsible Entity; **1.2.5.** Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System; and **1.2.6.** Coordination of controls for (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s). **Proposed CIP-013-1 Requirement R2** **R2.** Each Responsible Entity shall implement its supply chain cyber security risk management plan(s) specified in Requirement R1.
P 46	The new or modified Reliability Standard should also require a periodic reassessment of the utility's selected controls. Consistent with or similar to the requirement in Reliability Standard CIP-003-6, Requirement R1, the Reliability Standard should require the responsible entity's CIP Senior Manager to review and approve the controls adopted to meet the specific security objectives identified in the Reliability Standard at least every 15 months. This periodic assessment should better ensure	The directive is addressed in proposed CIP-013-1 Requirement R3. **Proposed CIP-013-1 Requirement R3** **R3.** Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months

Order No. 829 Citation	Directive / Guidance	Resolution
	that the required plan remains up-to-date, addressing current and emerging supply chain-related concerns and vulnerabilities.	
p 47	Also, consistent with this reliance on an objectives-based approach, and as part of this periodic review and approval, the responsible entity's CIP Senior Manager should consider any guidance issued by NERC, the U.S. Department of Homeland Security (DHS) or other relevant authorities for the planning, procurement, and operation of industrial control systems and supporting information systems equipment since the prior approval, and identify any changes made to address the recent guidance.	The directive is addressed in proposed CIP-013-1 Requirement R3 (shown above) and supporting guidance. **Proposed CIP-013-1 Rationale for Requirement R3:** Entities perform periodic assessment to keep plans up-to-date and, addressing current and emerging supply chain-related concerns and vulnerabilities. Examples of sources of information that the entity could consider include guidance or information issued by: •NERC or the E-ISAC •ICS-CERT •Canadian Cyber Incident Response Centre (CCIRC) *Implementation Guidance* developed by the drafting team and submitted for ERO endorsement includes example controls.
Objective 1: Software Integrity and Authenticity		
P 48	The new or modified Reliability Standard must address verification of: (1) the identity of the software publisher for all software and patches that are intended for use on BES Cyber Systems; and (2) the integrity of the software and patches before they are installed in the BES Cyber System environment.	The directive is addressed in proposed CIP-013-1 Requirement R1 Part 1.2.5 (discussed above) and CIP-010-3 Requirements R1 Part 1.6. The objective of verifying software integrity and authenticity is to ensure that the software being installed in the BES Cyber System was not modified without the awareness of the software supplier and is not counterfeit. **Proposed CIP-010-3 Requirement R1** **R1.** Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-3 Table R1 – Configuration Change Management*.

Order No. 829 Citation	Directive / Guidance	Resolution
		1.6. Prior to change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5, and when the method to do so is available to the Responsible Entity from the software source: **1.6.1.** Verify the identity of the software source; and **1.6.2.** Verify the integrity of the software obtained from the software source.
Objective 2: Vendor Remote Access to BES Cyber Systems		
P 51	The new or modified Reliability Standard must address responsible entities' logging and controlling all third-party (i.e., vendor) initiated remote access sessions. This objective covers both user-initiated and machine-to-machine vendor remote access.	The directive is addressed by proposed CIP-005-6 Requirement R2 Parts 2.4 and 2.5. The objective is to mitigate potential risks of a compromise at a vendor during an active remote access session with a Responsible Entity from impacting the BES. The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. The obligation in Part 2.4 requires entities to have a method to determine active vendor remote access sessions. The objective of Requirement R2 Part 2.5 is for entities to have the ability to disable active remote access sessions in the event of a system breach. **Proposed CIP-005-6 Requirement R2** **R2.** Each Responsible Entity shall implement one or more documented processes that collectively include the applicable requirement parts, where technically

Order No. 829 Citation	Directive / Guidance	Resolution
		feasible, in CIP-005-6 Table R2 –Remote Access Management.: **2.4** Have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access). **2.5** Have one or more method(s) to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access).
P 52	In addition, controls adopted under this objective should give responsible entities the ability to rapidly disable remote access sessions in the event of a system breach.	The directive is addressed by CIP-005-6 Requirement R2 Part 2.5 (above).
Objective 3: Information System Planning and Procurement		
P 56	As part of this objective, the new or modified Reliability Standard must address a responsible entity's CIP Senior Manager's (or delegate's) identification and documentation of the risks of proposed information system planning and system development actions. This objective is intended to ensure adequate consideration of these risks, as well as the available options for hardening the responsible entity's information system and minimizing the attack surface.	The directive is addressed in proposed CIP-013-1 Requirement R1 Part 1.1 (shown above).
Objective 4: Vendor Risk Management and Procurement Controls		
P 59	The new or modified Reliability Standard must address the provision and verification of relevant security concepts in future contracts for industrial control system hardware, software, and computing and networking services associated with bulk electric system operations. Specifically, NERC must address controls for	The directive is addressed in proposed CIP-013-1 Requirement R1 Part 1.2 (shown above).

Order No. 829 Citation	Directive / Guidance	Resolution
	the following topics: (1) vendor security event notification processes; (2) vendor personnel termination notification for employees with access to remote and onsite systems; (3) product/services vulnerability disclosures, such as accounts that are able to bypass authentication or the presence of hardcoded passwords; (4) coordinated incident response activities; and (5) other related aspects of procurement. NERC should also consider provisions to help responsible entities obtain necessary information from their vendors to minimize potential disruptions from vendor-related security events.	

Order No. 829 Citation	Directive / Guidance	Resolution
P 43	[the Commission directs] that NERC, pursuant to section 215(d)(5) of the FPA, develop a forward-looking, objective-driven new or modified Reliability Standard to require each affected entity to develop and implement a plan that includes security controls for supply chain management for industrial control system hardware, software, and services associated with bulk electric system operations.	Proposed CIP-013-1 addresses the directive. The purpose of the proposed standard is: *To mitigate cyber security risks to the reliable operation of the Bulk Electric System (BES) by implementing security controls for supply chain risk management of BES Cyber Systems.* The SDT believes prioritizing high and medium impact BES Cyber Systems in the supply chain cyber security risk management standards is an appropriate approach to meeting the directives in FERC Order No. 829 and focuses industry resources on protecting the most impactful BES Cyber Systems. The proposed standards address directives requiring plans, processes, and controls for supply chain cyber security risk management for "industrial control system hardware, software, and services associated with bulk electric system operations". High and medium impact BES Cyber Systems, as categorized in CIP-002-5, generally describe assets that are critical to interconnected operations including transmission operations, reliability coordination, and balancing functions. The proposed requirements prioritize these cyber systems by specifying mandatory requirements, while entities retain flexibility for determining appropriate steps for addressing supply chain cyber security risks for low impact BES Cyber Systems. The approach provides an opportunity for industry to take measured steps to addressing complex supply chain cyber security risks using an established prioritization mechanism. The reliability benefit of a measured and prioritized approach is that it is more manageable for responsible entities to focus the

Order No. 829 Citation	Directive / Guidance	Resolution
		development of their plans, processes, and controls on the smaller subset of cyber assets that includes the most significant cyber assets. Additionally, the SDT anticipates that the proposed standards may provide some risk mitigation for low impact BES Cyber Systems even though the requirements do not specifically apply to low impact BES Cyber Systems. One way that reliability benefits may be extended to low-impact BES Cyber Systems through the approval of CIP-013-1 is by responsible entities that own all three classifications of cyber assets (high, medium, and low). These entities may use some or all of the processes in their cyber security risk management plans that meet the CIP-013-1 requirements to plan and procure cyber assets that are used in low impact BES Cyber Systems. Another potential way that the reliability benefits may be extended to low impact BES Cyber Systems is through vendor adoption of CIP-013-1 related security controls that the vendor voluntarily includes in low impact BES Cyber System contracts with responsible entities. ~~CIP-013-1 is applicable to high and medium impact BES Cyber Systems. The proposed applicability appropriately focuses industry resources on supply chain cyber security risk management for industrial control system hardware, software, and computing and networking services associated with BES operations.~~
P 44	[the Commission directs] NERC to submit the new or modified Reliability Standard within one year of the effective date of this Final Rule. NERC should submit an informational filing [by December 26, 2016] with a plan to address the Commission's directive.	The proposed/modified standard(s) must be filed by September 27, 2017. NERC filed its plan to address the directive on December 15, 2016.
P 45	The plan required by the new or modified Reliability Standard developed by NERC should address, at a minimum, the following	The directive is addressed by Requirements R1, R2, and R3 of proposed CIP-013-1.

Order No. 829 Citation	Directive / Guidance	Resolution
	four specific security objectives in the context of addressing supply chain management risks: (1) software integrity and authenticity; (2) vendor remote access; (3) information system planning; and (4) vendor risk management and procurement controls. Responsible entities should be required to achieve these four objectives but have the flexibility as to how to reach the objective (i.e., the Reliability Standard should set goals (the "what"), while allowing flexibility in how a responsible entity subject to the Reliability Standard achieves that goal (the "how")).	Requirement R1 specifies that entities must develop, and Requirement R2 specifies that entities must implement, one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber Systems that include one or more process(es) for mitigating cyber security risks to BES Cyber Systems. The plans address the four objectives from Order No. 829 (P 45) during the planning, acquisition, and deployment phases of the system life cycle. **Proposed CIP-013-1 Requirement R1** **R1.** Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber Systems. The plan(s) shall include: **1.1.** One or more process(es) used in planning for the procurement of BES Cyber Systems to identify and assess cyber security risk(s) to the Bulk Electric System from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s). **1.2.** One or more process(es) used in procuring BES Cyber Systems that address the following, as applicable: **1.2.1.** Notification by the vendor of vendor-identified incidents related to the products or services provided to the

Order No. 829 Citation	Directive / Guidance	Resolution
		Responsible Entity that pose cyber security risk to the Responsible Entity; **1.2.2.** Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity; **1.2.3.** Notification by vendors when remote or onsite access should no longer be granted to vendor representatives; **1.2.4.** Disclosure by vendors of known vulnerabilities related to the products or services provided to the Responsible Entity; **1.2.5.** Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System; and **1.2.6.** Coordination of controls for (i) vendor-initiated Interactive Remote Access, and (ii) system-to-system remote access with a vendor(s). **Proposed CIP-013-1 Requirement R2** **R2.** Each Responsible Entity shall implement its supply chain cyber security risk management plan(s) specified in Requirement R1.
P 46	The new or modified Reliability Standard should also require a periodic reassessment of the utility's selected controls. Consistent with or similar to the requirement in Reliability	The directive is addressed in proposed CIP-013-1 Requirement R3. **Proposed CIP-013-1 Requirement R3**

Order No. 829 Citation	Directive / Guidance	Resolution
	Standard CIP-003-6, Requirement R1, the Reliability Standard should require the responsible entity's CIP Senior Manager to review and approve the controls adopted to meet the specific security objectives identified in the Reliability Standard at least every 15 months. This periodic assessment should better ensure that the required plan remains up-to-date, addressing current and emerging supply chain-related concerns and vulnerabilities.	**R3.** Each Responsible Entity shall review and obtain CIP Senior Manager or delegate approval of its supply chain cyber security risk management plan(s) specified in Requirement R1 at least once every 15 calendar months
p 47	Also, consistent with this reliance on an objectives-based approach, and as part of this periodic review and approval, the responsible entity's CIP Senior Manager should consider any guidance issued by NERC, the U.S. Department of Homeland Security (DHS) or other relevant authorities for the planning, procurement, and operation of industrial control systems and supporting information systems equipment since the prior approval, and identify any changes made to address the recent guidance.	The directive is addressed in proposed CIP-013-1 Requirement R3 (shown above) and supporting guidance. **Proposed CIP-013-1 Rationale for Requirement R3:** Entities perform periodic assessment to keep -plans up-to-date and, addressing current and emerging supply chain-related concerns and vulnerabilities. Examples of sources of information that the entity could consider include guidance or information issued by: •NERC or the E-ISAC •ICS-CERT •Canadian Cyber Incident Response Centre (CCIRC) *Implementation Guidance* developed by the drafting team and submitted for ERO endorsement includes example controls.
Objective 1: Software Integrity and Authenticity		
P 48	The new or modified Reliability Standard must address verification of: (1) the identity of the software publisher for all software and patches that are intended for use on BES Cyber Systems; and (2) the integrity of the software and patches before they are installed in the BES Cyber System environment.	The directive is addressed in proposed CIP-013-1 Requirement R1 Part 1.2.5 (discussed above) and CIP-010-3 Requirements R1 Part 1.6. The objective of verifying software integrity and authenticity is to ensure that the software being installed in the BES Cyber System was not modified without the awareness of the software supplier and is not counterfeit. **Proposed CIP-010-3 Requirement R1**

Order No. 829 Citation	Directive / Guidance	Resolution
		R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-3 Table R1 – Configuration Change Management*. **1.6.** ~~For a~~Prior to change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5, and when the method to do so is available to the Responsible Entity from the software source: **1.6.1.** Verify the identity of the software source; and **1.6.2.** Verify the integrity of the software obtained from the software source.
Objective 2: Vendor Remote Access to BES Cyber Systems		
P 51	The new or modified Reliability Standard must address responsible entities' logging and controlling all third-party (i.e., vendor) initiated remote access sessions. This objective covers both user-initiated and machine-to-machine vendor remote access.	The directive is addressed by proposed CIP-005-6 Requirement R2 Parts 2.4 and 2.5. The objective is to mitigate potential risks of a compromise at a vendor during an active remote access session with a Responsible Entity from impacting the BES. The objective of Requirement R2 Part 2.4 is for entities to have visibility of active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access) that are taking place on their system. The obligation in Part 2.4 requires entities to have a method to determine active vendor remote access sessions. The objective of Requirement R2 Part 2.5 is for entities to have the ability to ~~rapidly~~ disable active remote access sessions in the event of a system breach.

Order No. 829 Citation	Directive / Guidance	Resolution
		Proposed CIP-005-6 Requirement R2 **R2.** Each Responsible Entity shall implement one or more documented processes that collectively include the applicable requirement parts, where technically feasible, in CIP-005-6 Table R2 –Remote Access Management.: **2.4** Have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access). **2.5** Have one or more method(s) to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access).
P 52	In addition, controls adopted under this objective should give responsible entities the ability to rapidly disable remote access sessions in the event of a system breach.	The directive is addressed by CIP-005-6 Requirement R2 Part 2.5 (above).
Objective 3: Information System Planning and Procurement		
P 56	As part of this objective, the new or modified Reliability Standard must address a responsible entity's CIP Senior Manager's (or delegate's) identification and documentation of the risks of proposed information system planning and system development actions. This objective is intended to ensure adequate consideration of these risks, as well as the available options for hardening the responsible entity's information system and minimizing the attack surface.	The directive is addressed in proposed CIP-013-1 Requirement R1 Part 1.1 (shown above).
Objective 4: Vendor Risk Management and Procurement Controls		

Order No. 829 Citation	Directive / Guidance	Resolution
P 59	The new or modified Reliability Standard must address the provision and verification of relevant security concepts in future contracts for industrial control system hardware, software, and computing and networking services associated with bulk electric system operations. Specifically, NERC must address controls for the following topics: (1) vendor security event notification processes; (2) vendor personnel termination notification for employees with access to remote and onsite systems; (3) product/services vulnerability disclosures, such as accounts that are able to bypass authentication or the presence of hardcoded passwords; (4) coordinated incident response activities; and (5) other related aspects of procurement. NERC should also consider provisions to help responsible entities obtain necessary information from their vendors to minimize potential disruptions from vendor-related security events.	The directive is addressed in proposed CIP-013-1 Requirement R1 Part 1.2 (shown above).

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2016-03 Cyber Security Supply Chain Risk Management CIP-005-6, CIP-010-3, and CIP-013-1

Final Ballots Open through July 20, 2017

Now Available

Final ballots are open through **8 p.m. Eastern, Thursday, July 20, 2017** for the following standards:

1. CIP-005-6 - Cyber Security – Electronic Security Perimeter(s);
2. CIP-010-3 - Cyber Security – Configuration Change Management and Vulnerability Assessments; and
3. CIP-013-1 - Cyber Security – Supply Chain Risk Management.

Balloting

In the final ballot, votes are counted by exception. Votes from the previous ballot are automatically carried over in the final ballot. Only members of the applicable ballot pools can cast a vote. Ballot pool members who previously voted have the option to change their vote in the final ballot. Ballot pool members who did not cast a vote during the previous ballot can vote in the final ballot.

Members of the ballot pools associated with this project can log in and submit their votes here. If you experience any difficulties using the Standards Balloting & Commenting System (SBS), contact Nasheema Santos.

If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern).

- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The voting results will be posted and announced after the ballots close. If approved, the standards will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

Standards Development Process

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Mark Olson (via email) or at (404) 446-9760.
